SAN JACINTO ESTATE, LIMITED,
 Office of General Manager,
 P. O. Address, South Riverside, San Bernardino Co., Cal.
 CAJALCO, Dec. 18, 1891.

MESSRS. ADAMS & CARTER, 132 Market Street, San Francisco, Cal.—GENTLEMEN: After a continuous trial of different concentrators comprising the Frue Vanner, the "Holland," "Paradox," "Triumph" and the "Woodbury" concentrators, extending over several months, we find that we prefer the Frue Vanner, as it is easier of adjustment, runs smoother, has less wear and tear, and—having a positive travel—gives less trouble than the other more complicated and ever changing machines now in use here. The Frue Vanner not only saves a cleaner concentrate, but has less loss in the tailings, and is in several ways preferable to the other concentrators here.
 I am, my Dear Sirs, Yours faithfully,
 S. HARRIS, Manager

Mining Bureau Appropriation.

In the general appropriation bill, recommended by the Ways and Means Committee at Sacramento, the sum of \$50,000 is set aside for the State Mining Bureau, the same amount which was given two years ago. It is provided that 60 per cent of this sum is to be spent in geological field-work and scientific research. This appropriation gives the Bureau \$25,000 a year for the two years, and is about the amount required for the work. Too large a proportion, however, is allotted to "geological field-work and scientific research." This is about the time for a more systematic arrangement of the data already on hand, which would really be office, not field work. We mean by this that the Bureau should classify, catalogue and index the contents of its museum, library, reports, etc., in such a manner that the information therein could be easily obtained by those in search of it. In other words, the Mining Bureau should be more of a Bureau of Information than it is at present. When a miner wants to know all about any branch of the mining industry or any minerals, the information about that branch or mineral should be segregated in such a way as to be accessible to him. Under present circumstances, the data is scattered through innumerable volumes and reports, and is not available without considerable research. Ordinary miners unfamiliar with such matters cannot get at what they want. Some specially skilled assistants should be set at this task by the State Mineralogist, and all the information in possession of the Bureau be properly arranged for immediate service. In this way the institution could be made more practically useful to the mining community. Fault has been found that the reports repeat themselves too much; yet the appropriation bills are so worded that the ground must be gone over and over, and little is left to the judgment of the Mineralogist or the trustees. The object of the field work provision is plainly to keep a lot of useless political clerks out of the San Francisco office.

Bureau was not in any way represented in the lobby at Sacramento this year and no promises of patronage were required or made. The new Mineralogist, Mr. Crawford,

It was not necessary in this instance, however, as the

appears anxious to make a good record for the Bureau and for himself, and will doubtless take an active personal part in the work.

An Idaho Mining Camp.

Wardner, Idaho, is one of the mining camps of the Cœur d'Alene region, made famous not only for the labor troubles which occurred there, but for its rich mines and large product of silver and lead. One of the engravings on this page shows a view of the town, looking up toward the Bunker Hill and Sullivan mines, and the other is a view of that part of the canyon where the mines and part of the works are situated. Interest is centered in this camp just now, owing to the fact that the principal mines closed down this month, throwing a large number of men out of work. The reasons for this action are given fully in another column of the PRESS. The high trestles shown in the engraving are the supports for the wire-rope tramway of the Bunker Hill and Sullivan mines. The buildings at the mine have somewhat changed since the photograph was taken, but the views will give a good idea of the general location of the camp and mines.

THE MINING CAMP OF WARDNER, CŒUR D'ALENE, IDAHO.

BUNKER HILL AND SULLIVAN MINES, CŒUR D'ALENE, IDAHO.

JOHANNESBURG, 1200 miles north of Cape Town, South Africa, which did not exist six years ago, now has a population of 50,000. It is the new gold-mining region which is about 80 miles long and 3 miles wide. The gold yield is now from 130,000 to 150,000 ounces a month, exceeding the total of that of the whole of California. The mines are all owned by European capitalists—mainly Englishmen.

A GOOD MANY old mining men will be glad to know that at the last meeting of the Society of California Pioneers a resolution was adopted permitting all members who have paid \$100 in dues to become life members. Those not having paid that amount will be allowed the same privilege upon payment of the balance necessary to make up the \$100.

OPERATIONS at the Ward shaft, on the Comstock, were suspended on Tuesday, throwing about 15 men out of employment. The Ward shaft was operated jointly by the Bullion, Chollar, Potosi, Alpha and Exchequer mining companies, and through it the 1800-foot levels of those mines were being explored.

MARKET REPORTS.—Eastern and Local Metal Markets; Coal and Coke; Sales in San Francisco Stock Board; Notices of Meetings; Assessments, Dividends, etc., 159.

Comment.

The legislature provides in its appropriation bill for the sum of \$288,000 to be expended in the direction of agriculture and allied industries. To the Board of Horticulture it gives \$29,000; Board of Viticulture, \$30,000; State Agricultural Society, \$40,000; district agricultural societies, \$179,000, and citrus fairs, \$10,000. In the direction of mining the State gives \$50,000 for the support of the State Mining Bureau. There is no special objection to the relative proportions, though at one time it was proposed to cut the Mining Bureau appropriation down to \$20,000. The Ways and Means Committee, however, saw the error of its way and let go of \$50,000 of its means. It is to be hoped that the legislature will hold to the recommendation of the committee, and this will probably be the case.

The Stock Board mining companies cannot tell in these times how much money they will get from an assessment until the delinquent sale is over. People are apt to drop the stock and let it be sold when an assessment catches them. Prices have fallen so low on an average that a 25 or 50-cent assessment is too much to pay. It is unfortunate that such a state of affairs exists, but those who have been managing the market are themselves to blame. Time was when it was no trouble to collect assessments, but that time has passed.

There are many unemployed people in this city at present, and their complaints are beginning to be heard. Meantime, money is piling up in the savings banks, and savings banks are increasing in number. Those with money seem disinclined to make original investments, so that trade and manufacture languish. There is an abundance of money, but it is not circulated. This lack of enterprise is greatly to be deplored. There is a heaven needed here of Chicago or Denver men to show our monied people what enterprise will do. With \$100,000,000 lying in the banks and drawing only about 4 per cent interest, business is dull; but if it were more freely invested in enterprises, there would be better times in San Francisco.

Some of the Comstock bonanza men have been trying to get hold of gold properties in Nevada county in this State and failed. The claims were held at too high a figure. We venture to state that if the same figures for equal prospects had been asked for properties a thousand miles or so away, there would have been no demur; but gold properties within a few hours' ride of San Francisco are not so much sought for. They will be, however, in due time. Already there is more demand for gold mines than there has been for years. With silver, lead and copper low in price, the gold mine is king. There are

more of them here than in any State in the Union. Times have been dull in California mining regions for many years. Now that there is a revival in prospect, mines cannot be bought so cheaply as might have been the case a few years since.

The city sewer engineers are about to study the course of the currents in this bay at ebb and flood tide, so as to arrange about great sewer outlets. Instead of doing this, it would seem more to the purpose to visit the office of U. S. Engineer Mendell and see his current maps. All this work has already been done very thoroughly by the Government engineers in connection with the matter of torpedo defense. Moreover, they have not only speed and direction of surface, but of subsurface currents. All the needed data are already at hand and would doubtless be furnished to the city by the Government if asked for.

The Operation of the Caminetti Law.

Neither the hydraulic miners nor the anti-debris men are rejoicing over the final passage of the Caminetti bill, which is now a law. The valley men do not like it because it legalizes hydraulic mining under certain conditions, and because they will have nothing to say in future about how the mines may be operated. They were always opposed to restraining dams, on principle, and now the miners can build dams and the State courts or anti-debris agents cannot stop or regulate them. The hydraulic miners are not greatly in love with the new law because they must relinquish the right to mine except under the direction of the Government Commission; must build the restraining dams themselves on plans by others, and must pay three per cent of the gross output for the privilege of getting a license to work. Still, in our opinion, as it was impossible to get a hydraulic mining law which would satisfy both parties, it is perhaps a good thing to get one which dissatisfies both, since this is an indication that it is a compromise measure not too greatly in the interest of either. The people of the State were anxious to have the debris controversy settled and to see justice done to the miners, but they did not want any one-sided law or one which recognized the rights of one to the detriment of the other. True, the bill has been masquerading as one intended entirely to rehabilitate the hydraulic-mining industry of California. As originally drawn there were more favorable features for the miner than is the case as it stands, but such was the opposition met that concessions had to be made to get any law at all.

The Government has, however, by this law, committed itself in the direction of rehabilitating this great industry, and will doubtless have to take further action at another time. No immediate results need be expected from the law this year since the Commission is not yet appointed. Even after it is organized, it is required to formulate several plans which may take a year. If the Commission is in a position to issue licenses by next season there will be some companies ready to accept them, since in several instances dams are being built ready for the operation of the law. In most cases, however, the miners will first want to see the character of the restraining works demanded by the engineers. The law is to a certain extent in the nature of an experiment, though it has been proven that debris can be restrained by suitable dams. Whether the miners can build the kind of dams which may be required, and pay the tax, and then make a profit, remains to be seen. This depends on the individual mines and the character of the restraining works. The hydraulic miners have at least one cause of congratulation. Their industry is legalized—conditionally it is true, but legalized. Heretofore it has been under the hand of the law and at the mercy of its enemies. The anti-debris association has had more to say about the mines than the miners have themselves. This law removes their influence, and the miners will have only to deal with a commission of impartial, unprejudiced and honest engineers. It will not take a very great time to appreciate the practical working of the new law and it is our opinion that its features will be found much more favorable to the miners than the conditions under which they have been working, or than they at present realize.

At all events, the hydraulic miners should remember that by complying with certain regulations, they can now operate their mines. As the matter stood before, there were no honorable or legal means of doing this. It is true a recent decision permitted the North Bloomfield mine to go on and work, but the same court stopped another company which was mining under different conditions. A miner now complying with the Caminetti law, and having a license, cannot be interfered with, which, it seems to us, is an important point gained.

The supply and demand for lead are about equal these days, but the price continues very low. The price in London is lower than ever before and permits importations at \$4.10.

The Situation at Cœur D'Alene.

Closing Down of the Bunker Hill and Sullivan Mines.

A few days ago 300 of the 450 men employed at the Bunker Hill and Sullivan mines, Wardner, Idaho, were discharged and the rest will be given their time as soon as all the ore that is broken is run out. Altogether this shut-down will effect some 800 men directly and indirectly connected with the company. The entire product of that region is about 350 tons of concentrates per day, of which this single company turns out 98 tons. If the most important of these mining companies cannot continue under present conditions, it will be difficult for smaller ones to do so. All sorts of reasons have been given for the cessation of operations by people unfamiliar with the facts, but the MINING AND SCIENTIFIC PRESS is in a position to state them truthfully.

The main cause of the shut-down is the high rate of freight demanded by the railroad companies. This, in connection with the depreciated values of both lead and silver caused the directors of the company to close operations until more favorable conditions exist.

On both the Northern and Union Pacific railroads they pay \$16 per ton freight on concentrates, as against the \$6 per ton charged by the Atchison, Topeka & Santa Fe railroad for nearly the same haulage, and as against \$8 per ton charged the Butte and Anaconda mines, while the Bunker Hill and Sullivan has a haulage of only 270 miles more. This rate on 2600 tons of concentrates monthly absorbs a large proportion of the profits. The company ships to both Helena and Denver, as no one smelter can take all their product. The freight and treatment charges combined amount to \$25.50 per ton.

The railroad companies were asked to reduce their rates during the prevailing low prices for lead and silver, and were promised that a proportionate increase would be paid as the values of these products became greater. To this proposition the railroad companies would not listen. The Bunker Hill and other Idaho properties are forced to compete with the cheap labor of Mexico (60 cents a day in American gold) by the railroads bringing Mexican ore from El Paso to Kansas City smelters for \$6 per ton freight charges.

The railroad companies were even offered an opportunity to examine the accounts of the Bunker Hill and Sullivan Mining and Concentrating Co. so that they could see that the statements made were correct. They were also given permission to send their own mining engineers to examine the mines, to verify the condition of the properties. The railroad companies, however, declined all such propositions and refused to reduce the freight charges, so the mines were closed down. They will remain closed, too, until a higher rate is obtained for the products, or there is a lower cost of production, or of freight.

The depreciation in value of the silver and lead has been very great. On the same basis of production and shipment, the profit has declined about 115 per cent in two years, yet the railroad companies will not take this into account. While still making some money, the mining company is sacrificing its ore bodies while continuing operations under the present conditions. The depreciation in two years has been about \$4.60 per ton of crude ore, and as they are working 16,000 tons a month, this is a large sum. The ore value is about the same, but the decrease in price necessitates leaving a lot of the material unworked, thus reducing the length of life of the mine.

By continuing as at present the mines are being really worked for the benefit of the railroads, smelters and miners. The proportion of profit to the investment is insufficient. The chief regret of the company in closing down is the hardship worked on the laborers, though no one could have anticipated such a great depreciation of the lead and silver. In September, 1890, the company sold the lead for \$4.87 per cwt. and the silver at \$1.16 per ounce. In January, 1893, the lead was sold for \$3.79 and the silver for 83½ cents.

It will be remembered that there were serious labor troubles last year at Wardner. At the time of the labor trouble the union laborers demanded \$3.50 per day, not only for miners but for carmen, laborers, shovelers and all, and that only Union union men should be employed. This company then took non-union miners from California to fill the places of the strikers. Some of these men have been getting \$3.50 per day since they were employed. Of 450 men the average wages paid are \$3.42 per day. Over 400 more are at work, indirectly connected with the company's operations.

Referring to railroad rates again, it may be said it is possible to ship the concentrates all the way to San Francisco to be worked at the Selby works here at about \$1.50 per ton less than what is now paid. This would save about \$4000 to \$6000 a month; but all the product

cannot be handled here and there is no market for the pig lead.

The Mexican ores with cheap labor and low freight can pay the duty and get in here to the detriment of our own mines. The railroad south of us favors the smelters in order to get business. The Northern road thinks they have the miners up there "in a hole" and stick to their high prices.

This depreciation in values does not work quite such a hardship on the other Cœur d'Alene mines as they are taking out a smaller quantity of concentrates. The Bunker Hill and Sullivan is, comparatively speaking, a large low-grade mine. Some of the workings are over 60 feet in width in ore. They have a 750-ton concentrating mill, and two miles of Bleichert overhead tramway. This tramway delivers 450 tons of ore in 10 hours at a cost of 10 cents per ton. The weight is carried on a stationary rope while a traveling one moves the ore buckets. Water is brought in a distance of three miles in an enormous flume, carrying 10,000 miner's inches. The mill is down on the river and the Union Pacific tracks run right to it. The Northern Pacific is expected to put a line to the mill before long, which would effect a saving in transportation over that line. At present the ore has to be packed to be shipped over this line.

This company has the reputation of having one of the very best mills in the country. They sent a man over to Europe, and to all portions of this country, to get the latest things in concentrating machinery. Notwithstanding this, the losses in the tailings are as high as \$70,000 per month. This is because the concentrates have to be made of very high grade to pay the exorbitant railroad rates and smelting charges. It is necessary to get as much in a ton as possible. With lower rates they could make lower grade headings and considerable could be saved. The ore is worked now as closely as any in that region. What is desired is to make a lower grade product, which would be better for the company, the railroad and the smelter, but, as explained, the railroad will not listen to any reason, so the mines have been closed down. A few care-takers will be left in charge, but the company does not intend to resume operations until very radical changes take place in the existing conditions.

Carbonate, or Diamond Carbon.

This substance called "carbonate" is found in the province of Bahia, Brazil, and occurs, according to all accounts, in sandstone (itacolymyte). Its hardness is identical with the diamond—specific gravity, 3.012 to 3.200. Some specimens show an imperfect crystalline structure of a brownish-green opaque color, others of a granular structure, porous enough to resemble pumice-stone, dense, very massive, and found sometimes in lumps as large as a walnut. It is now used in the diamond drills.

This substance would appear to be the connecting link between uncrystallized carbon and the diamond, and a scientific examination of it might lead to important results. It was a fragment of this description of diamond that Melville Attwood recommended in the paper we published, with directions how to search for diamonds and to try or test any suspected stones, the hardness of the carbonate being less than the white or "Boart" diamond.

The Brazilian miners distinguish the various diamond-producing soils by the following names:

Grupiara is an alluvial deposit whose surface shows it to be unused bed of a stream or river.

Burgalhao are small angular fragments of rock, bestrewn the surface of the ground.

Cascalho are fragments of rock and sand mixed up with clay and forming the bed of a river.

Takoa curza are the above materials cemented together into a conglomerate mass.

Woodbury Concentrators.

A handsomely-finished Woodbury concentrator, manufactured in this city, was shipped to the World's Fair yesterday, where it will be exhibited in the Mines and Mining Building. Mr. Woodbury himself will probably go on to start the machine up at the time of the opening. A good position in the building has been allotted to this concentrator and it will be in shape for competitive tests if any are desired.

A number of these concentrators have recently been built for Colorado mines. Four have been shipped with a 20-stamp milling plant for a mine in Washington. Mr. Woodbury will shortly bring out a new corrugated belt of his own patent which will be applied on this machine. These concentrators are being tested at the Stickle mill, Angels, Calaveras county, and if everything is satisfactory, will be put in other mills belonging to the same owners.

The Keystone mine, Amador county, which started using one Woodbury concentrator now has a full comple-

ment of eight at work. The managers of this property are very careful, conservative men, and kept on testing so as to get the best results, not taking all the machines of this type until fully satisfied with their work. It will be remembered that not very long since this mine was about to close down owing to the low grade of the ore. Modern improved machines, however, have enabled it to go on. These concentrators handle the ore so it may be worked at a profit, thus giving employment to miners and others which would not otherwise have been the case. We are informed that they are about to work a lot of old material which has been thrown aside and which is only worth \$2 per ton. It is said that by concentrating this a profit of \$1 per ton can be shown.

Mining Briefs.

THE Comstock mining companies disbursed to employees last month \$105,338.

THE large consumers of copper are not buying as promptly as producers would like.

CHINA is said to use 10,000 tons of lead every year in foil for tea-chests. Most of the lead is purchased in England.

MURPHY MINING DISTRICT, a new Nevada camp, is only eight miles northeast of Vanderbilt district, San Bernardino Co., Cal.

THE Bi-Metallic mine, Montana, with its 100-stamp mill, has produced \$10,000,000, of which \$2,140,000 has been paid as dividends.

DURING February there were 2160 flasks of quicksilver received at this port from California mines as against 1543 for the same month in 1892.

THE Granite mine of Montana has yielded a total of \$32,000,000, and has paid out over \$12,000,000 in dividends. The company owns 200 stamps.

TOMBSTONE, Arizona, contributes ten per cent of the \$3000 required to put up a cyanide plant to test the merits of the process on the ores in that camp.

THE California legislature officially congratulated Congressman Caminetti on the successful enactment of the hydraulic mining bill which bears his name.

SOME Montana men have bought a large number of claims at Grand View, Snake river, and will put in improved machinery for saving the fine gold on the gravel bars.

By a vote of 21 to 12 the California Senate adopted Vann's resolution requesting the Representatives in Congress to do all in their power to urge the passage of a bill for the free and unlimited coinage of silver.

THE celebrated mining suit between the Tyler Mining Company and the Last Chance Mining Company, Idaho, which has been on trial in the United States Circuit Court, has been decided in favor of the Tyler Company.

AN opinion, delivered by Justice Blatchford for Chief Justice Fuller, in the case of George A. Pettibone and other striking Cœur d'Alene miners in Idaho against the United States court, decides in favor of the miners, and directed that the indictments against them be quashed. These cases grow out of the riots of the Wardner mines. The court at that time had granted injunctions restraining the strikers from interfering with the men, and it was alleged that Pettibone and others conspired to violate the laws of the United States. The court holds that the indictment under which they were convicted of this charge is defective in that it was not shown that the men had any knowledge of the order of the court. Justices Brewer and Brown dissented.

Personal.

S. ADAMS, a lead miner of Marquette, Mich., is taking a pleasure trip on the coast.

MAJOR FRANK McLAUGHLIN, of Oroville, is again in town and is staying at the Palace.

MR. JOHN MACKAY is rapidly recovering from the wound inflicted by the stock-dealing crank Rippey, and is entirely out of danger.

MR. J. J. CRAWFORD, the new State Mineralogist, has entered on the active performance of his duties at the State Mining Bureau in this city.

JOHN HOBSON, formerly of Placer county, will return this week to British Columbia, where he has the management of some hydraulic-mining properties.

A. E. WALTON, a mining engineer from London, has just returned from the mines at San Luis Potosi and Durango, Mexico, where he has been on behalf of an English syndicate.

J. J. McGRATH, one of the earliest of the Yukon river gold-miners, and who has been on that great river for many years continuously, has arrived here because of ill health, and is recuperating in one of the hospitals.

MR. A. T. HOLMES, who discovered the Holmes mine at Candelaria, Nev., has a very rich mine 36 miles from Pásal, Chihuahua, Mexico. It is known as the San Francisco Cerro del Colorado, or San Francisco of the Red Hill. The vein is 27 feet wide, and averages 60 ounces in silver.

NOT "ON WHEELS."—In the MINING AND SCIENTIFIC PRESS of Feb. 25 was a description of the operation of the Robinson rifle, with a small cut. In the course of the description occurred the sentence: "The operation of the rifle makes an agitation on wheels at the points D," etc. If the reader interested will substitute the words "or whirls" for "on wheels" he will get a better idea of the operation of the device. In the PRESS of next week will be given drawings showing some improvements made in the form of this rifle.

Coast Industrial Notes.

THE Wentworth Boot and Shoe Company, which has a factory near the Sixteenth-street station, is making arrangements to leave Oakland and locate in Santa Rosa.

CONTRACTORS from all over the State are competing with the Oakland firms for the contracts on the new High School for that city. The awards will be made next week.

THE Linda Vista irrigation district directors, San Diego Co., have awarded the contract for laying 70 miles of mains and lateral to Wade & Cooper, whose bid had been reduced from \$278,620 to \$211,130.

THE shipments of salmon from San Francisco by sea in February were 3271 cases and 675 packages, valued at \$20,055. Including New York shipments, the aggregate shipments were 13,095 cases and 675 packages, making a total of \$64,236.

THE values of exports of produce from this port by sea during the month of February were \$3,185,000, as against \$3,707,300 for the same month in 1892. The total since Jan. 1 is \$6,888,700, as against \$7,840,900 for the same period in 1892.

THE electric-railway motormen and conductors of Oakland have commenced the organization of a union. The large number of roads completed and in process of construction will give employment to about 200 men. The standard wages for motormen and conductors are about 22 cents per hour of an average of about 12 working hours per day.

MAYOR CHAPMAN of Oakland, has approved the ordinance granting the Oakland, Alameda and Piedmont Railway a franchise for an electric road from Twenty-third avenue to Broadway, on Twelfth and Thirteenth streets. The company has agreed to lay but one track so as not to interfere with the business of the street. The property owners will make an effort to defeat the franchise.

ALTHOUGH the weather has been somewhat stormy this week, it has not interfered with the commencement of operations in the building of the new Mission-street electric road. Since last Monday nearly 100 men have been at work on Mission road at Silver avenue, near the Five-Mile House, plowing up and grading the roadway in advance of the laying of the roadbed for the electric road on that street from the ferries to the county line.

OAKLAND already has her full share of electric railroads, but still there are more to come. The new electric road to West Oakland will commence operations next Sunday morning. Cars will run from Thirteenth and Franklin streets, along Thirteenth to Grove, thence to Eighth, and along Eighth to Pine and thence to Seventh street, connecting with the local train. The company that owns this franchise now has Oakland hemmed in with electric railroads.

MR. FILLMORE, general superintendent of the Southern Pacific does not think the strike of switchmen in Chicago will affect the California lines. He says: "These men in Chicago who are discontented are members of the Switchmen's Mutual Association, and this association has but a very small membership here. Nearly all our switchmen are members of a district organization, the Brotherhood of Railway Trainmen. Besides, the switchmen here are well paid and are content. Our men, for instance, are paid from \$75 to \$80 per month, and the foremen receive \$90 and \$100. We have not been called upon to raise wages, and we do not anticipate any such movement here as the Chicago switchmen are engaged in."

N. R. HARRIS, of the United States Secret Service, Major Bethel of San Jose, and J. C. Smith of Brentwood, Contra Costa county, owners of the tide land in Contra Costa county which was overflowed during the heavy storm of December last and is still under water to a depth of a couple of feet, have formulated plans for its reclamation, and work is to be commenced as soon as the water recedes sufficiently to permit of operations. The old levees will be repaired and new and more substantial ones constructed. The overflow in December caused a loss to the owners and lessees of about \$30,000. The reclamation of this land will bring about 20,000 acres of highly productive tide land under cultivation again.

ON Thursday of this week the St. Paul, the first steamer of the North American Navigation Co. to leave this port for Panama, sailed away with a full cargo. Merchants of this city are delighted at this step in the direction of emancipation from the transportation monopoly which has been so hurtful to California. The Pacific Mail Co. can no longer accept pay from the railroads for making trips with empty ships and then excuse it by the plea that regularity of rates is better than cheap rates. The North American Navigation Co. has started with a vigor which should insure success. The cargo consists mainly of Pacific Coast products, and is made up of wine, brandy, borax, canned fruit and a miscellaneous assortment of other commodities. Every bit of spare room has been utilized for the cargo, berths being filled and even bulkheads torn away.

As to real estate in this city, the *Circular* says: "The chief inquiry continues to be for outside business properties paying well. Faith in the future is a lost virtue in times of real estate dullness. Buyers are then deaf to everything but the present rent-roll. If it does not pay about six per cent net they are dissatisfied and do not as a rule care to invest. In either lively or dull times four or five per cent net in a growing locality is preferable to even six or seven per cent in stationary districts or in those which have reached a comparative maximum. People are beginning to see now that San Francisco is moving in the right direction to recover the trade it has lost by the railroad monopoly. That fact should help the real estate market." The entire tone of the market is encouraging and hopeful, and spring business is likely to be very good. In the line of building operations considerable improvement is to be noted, and this week's list of contracts is the largest in many months.

Some Points in Silver-Milling by Amalgamation.

NUMBER III.

Written for the MINING AND SCIENTIFIC PRESS by C. H. AARON.

In working raw ore with bluestone and salt we do have cupric chloride at first, and cupric chloride can act on mercury, producing calomel; but the cupric salt does not last long; it is quickly reduced to cuprous chloride by various causes, and as there is certainly danger of a loss of silver if that is metallized out of contact with mercury, it seems better to take some risk of adding the quicksilver a little too soon than to run the greater risk of adding it too late. If, however, there should be any fear that the quicksilver may not have been added soon enough, the error may be remedied by using some more bluestone; the cupric chloride thus produced will reconver the particles of silver in the pulp to chloride, at least superficially, and thus facilitate their amalgamation. After all, it is doubtful if calomel can be formed in presence of the soluble chlorides and metallic iron or copper.

The Aaron process is less rapid than the pan process, yet it requires but little power and possesses certain advantages. By this method it is always possible to produce fine bullion, and the consumption of bluestone is reduced to a minimum because the chemical action works in a circle, constantly reproducing cuprous chloride to act on the silver compounds in the ore. Experiments made many years ago proved that the ores of the Comstock lode yielded readily to this treatment, and many millions of dollars would have been saved to the stockholders had it been adopted. The absurd method which has been used in treating the tailings from those mines, and the learned fuss and bother about the base bullion obtained are enough to excite the laughter, or disgust, of those who know what might have been done. But those mines have been in the hands of sharpers and "muscular amalgamators" to such an extent that it has never been possible for any "outsider" to get recognition. Results have been tolerated there that would not have been tolerated in any other camp on the coast, and the sickening part of it is the eulogistic descriptions of the wasteful and stupid methods used which have been published from time to time.

Also, it is well known to the older metallurgists, though not to the ordinary "chump millman"—probably not to the new generation of American operators turned out by scores by our colleges—that fine bullion can be got from any roasted silver ore, no matter what its constituents, though possibly not always in the iron pans which have come to be regarded as a *sine qua non* in amalgamation by a nervous, restless, hurrying people who are never satisfied unless they see something "going like hell beating tank-bark," and who are paying now the penalty of haste and greed by seeing a noble series of mines worked out and half wasted, while one of the great products of the country has fallen more than one-third in value; for it is absurd to pretend that the change in relative values is due to a rise in gold and not to a decline in silver.

The fact is, that both gold and silver have fallen in value in the last 40 years, owing to a vastly-increased production. The proof of this is in the higher rates of wages all over the world, even in Asia. If certain or all classes of products are cheaper, that is because of improved means of production and distribution. The value of silver has declined more than that of gold, simply or mainly because its rate of production has increased more than that of gold has, as the records prove, while, at the same time, the cost of its production has decreased. There are but two ways in which the old relation of the two metals, misleadingly called "parity of value," can be restored: The one is, to diminish the output of silver; the other, to increase the production of gold. To coin silver extensively would raise its price a little, no doubt; but coined silver still exists. It is not consumed in the coining, and such a course cannot restore "parity" so long as the present relative rates of production shall continue. Still less would the issuance of paper money, backed by silver bullion, raise the price, for that silver would absolutely be there at all times; it would not even suffer the consumption due to abrasion, as coin in circulation would; nor would the glut find occasional vent in the loss of a shipload of it by wreckage or other accident to which gold is constantly exposed. Of course, an increased consumption of silver, by which it should be taken out of the market, as wheat disappears, would answer the same purpose as a diminished output; but I refer above to practical means. It is not likely that anybody will buy up silver and dump it into the Atlantic ocean. But this is a digression, yet I would advise miners not to count on a much higher price for silver than the present value—rather, they should be prepared for a further decline.

If the ore contains gold as well as silver, and if the gold is not satisfactorily saved in the treatment for silver, it is advisable to make the pulp alkaline by means of lime, lye or ashes, and work a couple of hours longer. At this time grinding may be necessary, though if that can be avoided it will be better for the next charge, because then the faces of the shoes and dies will retain a coat of amalgam. A little potassium cyanide may be beneficial, or better, a little red oxide of mercury, or other salt of mercury, dissolved in potassium cyanide solution, but not enough to saturate. To see if the liquid is right, put a drop on a gold coin and warm it. It should make a white spot on the coin; if it does not, add more cyanide.

Some ores require to be concentrated before amalgamation, to separate sulphurets, which would destroy the bluestone or would not yield their silver (or gold); the concentrators will require special treatment, generally roasting. The tailings from the concentrators must be run into vats and settled, to remove superfluous water, then treated in the pans, unless the hoss process is used, when pointed boxes may be employed to feed the pans.

I think concentrators will pay for themselves in any silver-amalgamating mill, being used below the settlers. They will save a portion of quicksilver and amalgam which is inevitably lost by settlers, and will also recover some valuable sand which may be again treated. For saving

quicksilver and amalgam, the Hendy concentrator is good, especially if lined with copper and amalgamated; for sandy matter, undecomposed sulphurets, etc., the vanners are better. Some arrangement is required to deliver the tailings to the concentrator in a constant and nearly equal stream, which the settlers cannot do. Here, again, pointed boxes are useful as it is an advantage to get rid of the muddy water which usually contains nothing of consequence coming from the settlers, and use clean water on the concentrators if the supply is abundant.

Sometimes a calcareous ore which contains too much lime for successful roasting can be rendered fit by a partial concentration, which removes the excess of calcite with little loss of value. I have known a case in which very good concentration was effected by simply sifting the rather coarsely crushed ore; the portion which passed the sieve contained \$200 per ton, while that which refused had only \$20 per ton, which, under the circumstances of time and place, would not pay for working. This method of concentration is of wider applicability than is generally known, and might be still more so if conjoined with special methods of crushing.

As I am not pretending to exhaust my subject, nor wishing to repeat much that may be found in the standard works, but rather to offer a few pointers which cannot be found in books, I will say no more about concentration, itself a large subject, and will only make a few remarks on pans, settlers, amalgam and furnaces.

The now almost universally used combination pan is a good machine for its purpose. The wooden staves should be protected to a height of eight or ten inches, either by a high inside flange on the iron bottom or by a special cast-iron ring, to prevent the cutting of the wood by the sand which is thrown forcibly outward by the muller. In default of such protection, wooden staves an inch thick and six or eight inches long may be tacked around, forming a zone, and renewed when necessary.

The settlers, as now made, with plate mullers like the pan, are not very bad, though not what I should like. I sometimes alter the arrangement of the wooden shoes. The older form of settler, with arms furnished with plowshares, rakes and cultivators, was a wretched affair, fit only, like its prototype, the Mexican *lavadero*, to treat the impalpable pulp from the *patio*; but this kind, even, may be made to work as well as any by removing the plows and cultivators, and substituting pieces of scantling extending from the outer end of one arm to the inner end of the next, in such fashion, with regard to the direction of revolution, as to throw the pulp outward. These shoes should not reach very near to the side of the settler, but the speed of revolution should be sufficient to prevent any accumulation of heavy sand there. When I build a settler, I provide a groove about four to six inches wide and three inches deep, surrounding a false bottom. In this groove not even coarse sand can accumulate, because of the strong current produced by the revolving muller, or stirrer; but any considerable object, such as a lump of rock, a cold chisel, etc., which may find its way into the machine, is at once swept into the groove and there remains, disturbing nothing, until a convenient occasion for its removal. The sand and globules of mercury rise toward the surface, pass over to the center, and there fall, to be again swept outward and lifted by the current. In this way, with a plenty of water, the globules of quicksilver are gradually united into masses, which, too heavy to be lifted by the current, fall into the groove and rest in peace until drawn out in the usual manner. Such a settler is described and illustrated in a little book on "Testing and Working Silver Ores," published in 1876 and still on sale at the office of this paper.

Butte County Mines.

NIMSHAW, BUTTE CO., CAL., Feb. 24, 1893.

TO THE EDITOR:—After a long period of waiting, the mines of this former rich gold-producing district are assuming a decidedly favorable outlook. Until the late severe weather interfered to some extent with work, reports of new prospects were of almost daily occurrence. Both quartz and gravel properties are making good showings, and, unless appearances are very deceiving, not many months will elapse before this section of Butte county resumes its former prosperous condition. The Big Butte Mining Co., which lately purchased the Morgan ledge about a mile from this town, has refused a tempting bonus for its bargain, and are breaking ground for a ten-stamp mill. Practical miners who have examined the property claim a great future for it. Rock worked by Mr. Morgan in an arrastre paid over \$30 per ton gold and the sulphurets assay upward of \$200 per ton of ore.

Near Powelson and Inskip several ledges have lately changed hands at fair prices, and work will be started on them shortly. Miners in this locality have been handicapped on account of there being no mill, hence little prospecting has been done for milling quartz. With a mill in this district, the early opening of several good mines may be looked for. Among the late strikes in gravel is that of McLellan & Hupp, on Mosquito creek, which has caused quite a ripple of excitement—\$60 to the pan is not an every-day prospect. The owners are running a tunnel and will strike the channel in about a month. The Oro Fino is paying very well. At the Indian Spring heavy work is being done in passing the falls, just below which very rich gravel was found.

The Butte Bell Co. are driving a bedrock tunnel, said to be one of the finest pieces of work in the county, but only in keeping with everything this company undertakes. They expect to strike the channel in about 200 feet, and should it prove as rich as in the adjoining claims, look out for a big boom in this camp.

The Reardon-Palace drift claim is again in pay, with good promise of permanency. John Hupp takes the pessimism on nuggets for the season; the two-pounder taken from his Little Butte property is high luck. The Ohio and Schmidt claims, above the forks of Butte, are producing some fine dust. The old Blackleg drift claim near Nimshaw has, after a sleep of years, been reopened, and is

showing up in a manner indicating an early return to old-time prospecting. Gold lately found gives positive proof that the lead lost many years ago is again discovered, and it is now but a question of a short time that this famous property will take a leading place among the producing gravel mines of the State.

The celebrated Pershbacker mine still remains idle, rumor says, awaiting adjustment of titles. Why this property, acknowledged to be the richest drift gravel mine in California, should be kept shut down for years, is beyond the comprehension of "honest miners." It is to be hoped that the several surveys of the past year are not without significance, and spring will see work resumed permanently. Hoping the foregoing may prove interesting to the many readers of your valuable paper, I am yours respectfully,

J. C. B.

San Bernardino Mining Districts.

VICTOR, CAL., March 6, 1893.

TO THE EDITOR:—The Vanderbilt District is coming to the front. It is located about 30 miles from Goff Station, on the A. and P. Railroad. About 12 miles of track have already been laid on the new railroad which will pass through Vanderhilt, thence through the New York District and will finally be built through part of Nevada and Utah. It will pass through some of the richest mining country in California. There are 40 men working on the group of mines in the New York District which property was purchased by a Denver syndicate. At Danby this same company has bonded mines from Marcus Alby Thompson, and is doing considerable prospecting work and development upon them. They are proving up all that could be expected, showing up some very rich ore.

At Calico, the Silver King Mining Company, Limited, is running its 30 stamp mill day and night, and is shipping its usual quantity of bullion. The mines are looking better than ever. The borax mines have been sold, and are increasing their output of boric acid from 10 to 18 tons per day. Mr. Perry still has charge of this property. The force of men working these mines has been increased. At Oro Grande, Vyman Gruendike & Co. are mining a large quantity of limestone, which they convert into lime. This rock makes as good lime as can be obtained on the Pacific Coast. At Victor, a company of Eastern capitalists has been formed, their object being to dam the Mojave river at the narrows, near the town of Victor, and, by running ditches, irrigate a large portion of the Mojave desert. This is the finest location for a smelter that your correspondent knows of, there being plenty of gold, silver, lead, copper and iron ores, also timber and water right in the vicinity.

Twenty-nine Palms mining district will come to the front in time. There are probably some very good prospects there, but they need capital badly. At Perris, the Good Hope mine is the only bullion producing one at the present time. They shipped a bar of gold from there last month. At South Riverside, the tin mines are deserted; nearly all their stores have been sold at constable's sale.

ALBERT MINER.

Progress of the Production of Nickel.

The use of nickel has been of late so largely on the increase that special steps have been taken for an increased production of the metal. The production of nickel, which was about 400 tons in 1878, the year of the discovery of the New Caledonian ores, now exceeds 5000 tons per annum, and the New Caledonian supply has been so supplemented by the yield from other districts that a supply of about 10,000 tons of pure nickel per annum may shortly be expected. Nickel is found in New Caledonia in a single mineral, garnierite or noumeite, which is a bright green hydrated silicate of magnesium and nickel. The most improved plan of extracting the metal from the ore consists in reducing the latter in a regenerative furnace resembling in structure the type of furnace used in Belgium for reducing zinc oxide. The reduced metal is afterward sifted to separate the cubes or disks from irregular and broken masses; they are afterward collected by means of magnets. Among the more important of the recent applications of nickel is that of the alloy (20 parts of nickel, with 80 parts of copper), which is now used for the casing of bullets for some of the small box rifles which European countries are adopting in their armament.—St. Louis Globe Democrat.

INGOT CAST STEEL TOOLS—A French journal says: "The Acieries de Saint-Denis are offering at present tools and mechanical pieces generally manufactured according to a method, and with machinery permitting the supply in ingot steel (*acier fondu*) of articles which hitherto were made of steel iron or cemented cast iron. It is notorious that annealing, for one product as for all, is the cornerstone upon which they depend, and annealing, notwithstanding repeated care, is irregular. The metal results either too malleable or too hard. With ingot cast steel (*acier fondu coule*) having for base a central substance, finished iron only, to the exclusion of crude iron or steel, the Acieries de Saint-Denis obtain an ingot steel (*acier fondu*) the fluidity of which permits the manufacture by casting in pieces or tools of a weight inferior to 15 grammes. This steel, owing to its homogeneity, has a maximum density. It can be tempered like any other ingot steel. Its resistance to fracture exceeds 65 kilogrammes; its elongation is 15; its content is: C, 227; M, 950; S, 630; PH, trace. The crucible furnaces are of special construction with refrigerating and hot-air apparatus; they are mechanically actuated. The fusion temperature is approximately 2400°. It is incontestable that with the present tendency to replace tools of iron sheathed with steel by those of solid steel, this new method of manufacture has a great future. The same tendency exists for mechanical pieces. Here the engineers, having to temper certain portions of the pieces, and being able to do this, if iron is used, only after cementation, will find the process of considerable advantage. The solid-steel articles are no dearer than those of sheathed steel.

Cyanide Works in Africa.

The following article in reference to what Charles Butters is doing at Johannesburg, South Africa, was taken from the *Johannesburg Star*. Mr. Butters, it will be remembered, built the reduction works at Kennet, Shasta county, in this State:

Chas. Butters, who has so ably managed the Robinson Chlorination Works, has now nearly completed the new chlorination works just below Prospect township. These works, which are being built by a company raised by Mr. Butters himself, are but the beginning of larger and more commodious works, capable of treating a very much greater quantity of metallurgical products. The roasting furnaces, built after a particular pattern of Mr. Butters', will enable somewhere about 400 tons of concentrates to be treated per month. Everything will be in full swing next month, but even now Mr. Butters is prepared to buy tailings and concentrates. He is prepared also to buy and refine cyanide slags (which are now shipped to Europe), iron accumulating in the mortar boxes, which contains more or less gold, and copper plates that also contain gold. Mr. Butters is thus another buyer in the market for concentrates, and as buyers are few and the companies could, if they pleased, produce considerably more concentrates than they do, at a very small cost, new enterprises like this will give an incentive to companies to bring more concentrates into the market. Later on, when their works are extended, Mr. Butters hopes that the company will be in a position to treat lead, copper and silver ores.

The tankhouse is well in hand and will be in order by the time the furnaces are properly started, whilst the offices and smelters may be said to be ready for use. The manager's house is a fine-looking structure just ready for occupation. The furnace will be fired for drying purposes towards the end of the week.

CYANIDE WORKS.

The company has already completed, and working, cyanide works just below the Crown Reef battery. The capacity of these works is 1700 tons of tailings a month, and it was from here that the bar of gold was taken which was wrongfully attributed to the new chlorination works. A second cyanide plant is also in course of erection in another part of the rand, and this plant, when completed, will be capable of treating about 2000 tons of tailings per month. Both these plants will be worked on the MacArthur-Forrest principle under the personal supervision of Mr. Butters.

THE WORKSHOPS.

Recognizing the greater facility in obtaining skilled labor by having the workshops in Johannesburg, Mr. Butters has had erected extensive workshops at the corner of Market and Delver streets. Here he has a foundry, machine, blacksmith, carpentering and pattern shops, all in working order, where everything is manufactured for the different works. The workshops are large and airy and take up considerable extent of ground. Altogether the Rand Central Ore Reduction Works are calculated in the near future to help very materially in the output on the rand. Chlorination works like those belonging to this company require a considerable outlay of capital, and it speaks well for Mr. Butters' faith in the future of the fields that he should be willing to advise the expenditure of capital in this direction. Concentrates are so easily obtained, and at such a little cost, that the supply should be perceptibly increased. They go far towards paying the expenses of milling. Last month the Ferreira received a check for £2500 for a parcel of concentrates; the Wemmer received £800 for a parcel and the George Goch, which obtains its concentrates by the simple method of a double length of blanketing, netted last month about £400 for concentrates. As the companies produce more concentrates, so Mr. Butters is prepared to increase the size of his chlorination works, and, if necessary, put up fresh ones in other parts of the rand.

The Tin-Plate Industry.

Special Agent Ayer has submitted another report to the Treasury Department on the development of the tin-plate industry. The period covered by this report is the quarter ending December 31, 1892. The report shows that during that period 32 firms produced 19,756,491 pounds of tin andterne plates proper. The same number of firms produced during the previous quarter 19,952,725 pounds. Of the production of the past quarter, 6,138,739 pounds, or a little less than one-third of the whole, were bright tin plates, of which 5,274,434 pounds, or about 86 per cent, consisted of the class of plates weighing lighter than 63 pounds per 100 square feet; 13,617,752 pounds wereterne plates, of which 12,684,646 pounds, or more than 93 per cent, belonged to the lighter class of plates. Of the 32 firms who submitted their sworn returns for the quarter, nine firms made and used their own black plates exclusively, five others used only American plates, eight used both American plates and foreign plates, and ten used only foreign plates. The American plates are generally preferred by manufacturers to the foreign. Full returns from the importing and exporting ports of the country show that of the class of plates weighing lighter than 63 pounds per 100 square feet, there were imported during the fiscal year ending June 30, 1892, 374,697,000 and of the same class of plates there were exported 136,773,190 pounds, making the net importation for the year 237,923,816, one-third of which is 79,307,939 pounds.

Under existing provisions of the law, American manufacturers must produce during one of the fiscal years ending June 30, 1897, one-third of the net importations of one of the said years. If it be assumed that the importations will be less during any one of the remaining years specified, the amount of the lighter class of plates which must be produced by American manufacturers but in one of the six years in question may be positively stated at 79,307,939 pounds. Agent Ayer thinks it probable that this amount will be equaled during the present fiscal year. The report

states that the Temescal tin mines in south California and the Harney Peak mine in South Dakota have suspended operations, and suggests that, inasmuch as it now seems probable that the tin mines of this country will not be developed in the near future to an extent that will afford an adequate product of the metal, it is worthy of consideration whether, in the interest of tin-plate manufacturers, the law which imposes a duty of four cents per pound on and after July 1, 1893, on Cassiterite and bar, block and pig tin might not be advantageously repealed.

Jeff Doolittle's Idea of Gravel Mining.

Jefferson E. Doolittle, one of the owners of the Gould & Doolittle placer mine, near Gold Run, Placer county, and of other mines in Nevada county, is at the Palace. Mr. Doolittle says the indications are that this will be a very lively year in gold mining.

"The more I mine the more I am convinced," said Mr. Doolittle, "that there is just as much gold to be got from the California mountains now as there ever was in forty-nine or in the fifties. In fact, there is a great deal more in a given area than was found at that or any other time. Why don't we have the booms, then? We will have them eventually, but one reason why they are delayed is because much of the rich surface gravel is worked over. Now we have got to go under the lava, or whatever rock stratum overtops the old channels, and get out the gravel by drift mining. That has been found about the best way to get at the gravel. A tunnel is run in on the channel under the cap rock and then drifting is done to the right and left and the gravel brought out to the main tunnel on a wheelbarrow and thence conveyed outside and the gold washed out."

"There are a great many underground gravel beds, rich in gold, being worked in this way now in Nevada and Placer counties, and they are found exceedingly profitable. The dirt is just as rich as that found on the surface in the old days. The number of drift mines is steadily increasing and I am satisfied the gold output will as a consequence be largely augmented. Of course there are a great many open and unobstructed valleys being found at times that are more or less rich, and which can be worked on from the surface down. In some of these the gold is reasonably plentiful from the grass-roots down, but on the bedrock, which may be in some instances hundreds of feet below, it is always a great deal richer than at the top. There, generally speaking, all the nuggets and coarse grain gold are found."

"El Dorado, Placer, Nevada and Tuolumne county miners have now pretty well concluded that they will give especial attention to going under the lava cap-rock, and also going to bed-rock on the rich open ground. More of such mines are being opened than ever before. The shallow, open gravel beds, those that require only a short distance to bed-rock, were the ones the '49ers chose to work on. As a rule they have been pretty well gleaned of the gold, and now these others remain in almost measureless extent and numbers. In these there will be great booms, I have no doubt. Everything points that way, and 1893, I think, will be livelier in gold mining than for many years."

Mr. Doolittle has been a gold miner in California all his life. When as a child in the Sierra foothill mines he first began to play in the dirt he began washing out gold. He says real mining there has only begun.

What the Miner Wants.

He wants a "false set" of teeth for the "mouth of the tunnel," and a girl of experience to paint and powder the "face of the drift."

He wants a four-in-hand tie for the "collar of the shaft," and a boot for the "foot of the incline."

He needs a jockey who can ride a "porphyry horse" and use the "spur of the ledge" on a "bucking donkey" (pump) and "drive a crosscut."

He wants an "expert" burglar to "tap the ledge;" a detective to "follow the vein," and a watchman to guard the "silver plate."

He wants a hat that will fit a "head of water," and a man who can wear the "cap of a tunnel-set."

He wants a soldier who has been "drilled" to handle a "gun" and to "shoot," and work a "battery;" also a painter who can distinguish a "color."

He wants a "square set" of men to work for him, some feed for his "giraffe," a bird for the "cage," a hunter to hunt the "gopher" and a "grizzley" and a sprinter to "run a drift" against time.

He wants a tidy man who will put an "apron" on and "clean up" the mill, sweep up the "dust" and "wash dirt."

He also would like to have the Government furnish him with "stamps" free of charge.

He wants the "roof of the drift" shingled with twenty-dollar pieces.

And when he "dies" he wants to go to the "upper level" and play on a silver "horn" and have his "slap-jacks" baked in a "gold pan." HOT STOVE MINER.

The New Smelter at Los Angeles.

The Los Angeles *Times* says: Work is to begin at once upon the buildings and furnaces for the new smelter, which is to be located near Ninth street, on the east side of the Los Angeles river. The plans, which were seen yesterday by a *Times* reporter, at the office of the company are quite elaborate, and prove that the new institution will be a model one of its kind.

Dr. F. M. Endlich, the general manager of the Southern California Smelting and Refining Company, who has just returned from Chicago, brought with him the plans, which are to be at once submitted to contractors, and, as soon as bids are received and accepted, construction will begin at once and pushed to completion.

Dr. Endlich explained to the reporter his system for catching flue dust from the furnaces and preventing its escape into the atmosphere.

"You will see," said the doctor, "that we will conduct all flue-dust, which is the same as smoke, into a dust-cham-

ber which is 90 feet long, whence it passes into a smoke-stack 99 feet high. Throughout the length of this dust-chamber will be obstructions, or dams, made of brick, nearest the furnace and canvas at the extremity toward the stack. These obstructions will catch the solid particles of dust so effectually that there will be scarcely any dust in the smoke which finally escapes 110 feet from where it originated in the furnaces. Running throughout the length of the bottom of the dust-chamber will be a screw which will carry out and deposit in a receptacle all the dust which settles in the bottom. It is estimated that nearly 5 per cent of the ore passes from the furnace with the smoke. This dust is valuable, and it is to our advantage to save as much of it as possible."

"How will you use this dust?" asked the reporter.

"We put it back and smelt it and save the dust it contains. As a matter of fact, this contrivance, which I invented myself and have already used successfully, saves all the dust and prevents it poisoning the air."

"How about the sulphur fumes?"

"Oh, they come from the roasting furnaces, which will have a dust-chamber about 30 feet long and a stack 60 feet high. The character of the ore which we will handle will not call for frequent use of the roasting furnaces. I do not think we will have to resort to roasting ore more than 40 days in the year. What sulphur fumes are liberated will be so dissipated by the air as to be unnoticeable and consequently not injurious. There has been much prejudice against this enterprise, but there can be no complaint against it when once its operation is seen."

"What will be the capacity of the works?"

"At present from 70 to 80 tons of ore a day, but, as you see by the plans, we have provided for an extension, with two additional furnaces, which will give us a capacity up to 250 tons."

From Dr. Endlich the reporter learned much about the *modus operandi* of converting crude ore into refined silver. From the time that the ore is dumped into bins from the cars, which will be run direct to the works by means of spur tracks from both the Santa Fe and Terminal roads, until it emerges in bright, shining metal pigs, it passes through a variety of operations quite bewildering to those who have no technical knowledge of the business.

The machinery will be furnished by Fraser & Chalmers, of Chicago, and several carloads of it are now ready for shipment and will arrive by the time the railroad spur tracks are built. There will be 130 tons of this machinery.

A California Mine Owned by Ladies.

A correspondent of the Tuolumne *Record*, in writing of the Martha Washington mine, says:

The features of this corporation differ essentially from all other mining associations, in that its membership is confined exclusively to the feminine gender. No male need apply. Neither is the stock of the company made transferable to the masculine gender. Thus its mining pursuits are delegated to a board of directors chosen by the company, which board direct operations under the able management of Byron C. Hall, who is assisted in the multiplicity of plans, changes to be wrought and faults remedied, that naturally arise as work proceeds, by Mr. W. H. Purdy, practical engineer, who is thoroughly schooled in the new system of placer mining, as well as in the old methods of working auriferous sands and gravel and separating the gold therefrom. The company is duly incorporated under the laws of the State, with the view of devoting its attention to the further development of the mineral resources of the State, having their headquarters at San Francisco.

This property, now known as the Martha Washington placer mine, was formerly the John Pereira placer claim, and is situated on Peoria Flat, 12 miles in a southwesterly direction from Sonora, and lying between a range of hills along the south bank of the Stanislaus river and Table Mountain; distance from base to base, one-half mile at that point crossing middle of claim. This mine covers a large tract of mineral land, embracing an inexhaustible body of gold-bearing gravel.

The company, for the past eight months, has been engaged with a force of men constructing ditches and flumes, both for conducting water and gold-saving, and has also finished laying 5000 feet of 11 and 16-inch pipe—bulkhead at an elevation of 370 feet above the level of where the electric plant will be put in place, and the hydraulic giant set to working to wash off a bench of ground where it is proposed to set the necessary machinery for final operations. These are preliminaries toward the introduction of the "Bennett system" of placer mining. We shall, by special invitation, be promptly on hand on the day the machinery is set in motion, constituting the "Bennett system," through power transmitted from the electric motor, and it is hoped that its supremacy over other systems of placer mining hitherto in vogue in this county will be fully established.

As evidenced that Mr. Hall, manager of the company's mining operations, is theoretically and practically qualified to carry out all necessary plans in attaining the objects aimed at, we find he has operated extensively in the Atlantic States—Pennsylvania, Virginia and a number of other States—in the coal mines and in the gas and oil regions with great success, having had under his supervision from 1000 to 5000 laborers, engineers and mechanics. It is said that whenever he placed a force of men boring for oil, invariably his instructions were: "Now boys, remember, it is petroleum or hell," and that auger was kept sinking until success crowned the undertaking; hence we find the right man in the right place. Mr. Hall has been on the coast eight years, and during that time has shaped and put in successful operation a number of valuable mining enterprises.

To return to a further description of the mine—its value and prospects of proving remunerative to the company, of course, remains to be determined. The undertaking, however, on so gigantic a scale, has set many of the speculative minds among the old hydraulic miners in the county

to thinking and wondering what will be the ultimate outcome of the enterprise. Be that as it may, the operations carried on at Peoria Flat (Martha Washington mine) in years gone by, that were confined merely to surface workings, furnish no index of what the deeper deposits of gravel may contain in mineral wealth. The depth of these deposits have never yet been determined, and past experience has proven, without exception, that in other localities where beds of gravel of like formation have been worked, that the deeper or underlying strata carry a greater percentage of gold. It must be conceded that such placers as now being spoken of differ materially from that character of mineral lands which make up the greater bulk of the rich placers of this county, because these deposits reveal the fact of having been the channels of ancient rivers scoured through in many places by action of volcanic flow.

In view, then, of these facts, as the company has chosen old Tuolumne for their mining ventures, and come to stay, with their capital and energies combined, to open up a new era in placer mining in the county, strictly merit the support, encouragement and best wishes of all good and well-meaning citizens.

Colorado Mines.

S. B. Clark of Aspen, Colo., who is in California contracting for fruit to supply his commission house at that point during the coming seasons, tells the *Los Angeles Times* that Colorado, despite the depression of the silver market, is progressing as rapidly as ever. "Indeed," added Mr. Clark, "we have not felt the depression in Aspen, and probably won't, as with the drop in the price of silver the demands of mine-owners on railways in hauling and smelters in reducing to meet the drop in sympathy was acceded to without a murmur, which fact acted as an incentive to increase the product from the big mines, while local capital put in two large smelters, one, the Holden smelter, now working 300 men, and another, owned by a stock company, giving employment to 75 men.

"Of course the little mines, away from railway lines and smelters, and those producing low-grade ores, closed down, but the majority of our mines, all our large ones in fact, produce high-grade ores, and being well developed, can work a large force of men.

"I have not the least doubt," continued Mr. Clark, "that the mines of Aspen, Leadville, Ouray and similar high-grade ore-producing districts could make money should silver drop to 65 cents. Of course, we hope silver will not drop to such a price, and all of us are firm in the belief that it will increase in market value as it should.

"What mines are being worked at Aspen? Well, the Aspen group is working full-handed, as is the Durant group and the Dellas, Bushwhacker and Regent. The old Molly Gibson is working all the men she can give room to; she paid over \$2,000,000 out in dividends last year, and from indications will exceed that amount the current year. The Smuggler is now working about all the men she can use, while the Aspen Mining and Smelting Company is again working at full blast on its properties.

"In Tourtelotte Park, just over, or rather on top of the hill, the Celeste, Edison, Lotta and Last Dollar mines are working full-handed, while a number of smaller properties in the immediate vicinity are also producing.

"No, our smelters cannot handle all our ores. We ship to Pueblo, Denver, and even to Great Britain, but only the very refractory high-grade ores go across the water, to be worked at Swansea, Wales.

"I should say there were employed in the Aspen mines 5000 miners, who are paid \$3 per day; probably 1000 more are employed in the surrounding smaller camps dependent upon Aspen for supplies."

Nevada Antimony Mines.

It may not be generally known, but nevertheless it is true, that Lander county has the richest and most favorably located antimony mines in the world, and the veins are larger and better defined than any other yet developed, says the *Reese River Reveille*. We refer to the Big Creek antimony mines, owned by the Big Creek Mining Company, situated 14 miles south of Austin, in the Toiyabe range of mountains on the western slope thereof, and on Big Creek.

The mines are situated on the south side of the main canyon, about 1300 feet from the bed of the canyon, and the ore from the vast ledge in the mines is conveyed therefrom on an aerial tramway to the ore-house below, with very little labor and at a minimum of expense. The capacity of this tramway is fully 50 tons every eight hours, hence one can form some idea of the rapidity with which the ore from the mine can be handled. There are at present nine men employed at the mine extracting ore from the stopes, some days breaking down as much as five tons of rich sulphide, and other days not so much, all depending upon the amount of ground opened up for active stoping.

On entering the Beulah mine in midlevel, between levels 3 and 4, we find a stope opened up on the ledge fully 100 feet long, and the rich ore streak in the same nearly three feet wide on an average. The whole of this vast ledge will assay well up to 65 per cent antimony, and to say that the ore, as we saw it in the ledge and was being taken out by the miners, was dazzling is putting it very mildly. We are much impressed with the great richness of this mine, and we challenge any one to tell us of a better one. Holding a candle so that the light would reflect on the bright ore, in some places lying in heaps as it had been blasted out of the ledge, and looking ahead for a distance of 40 feet or so at the mass of ore that had been "stripped" by the boys preparatory to taking out, and again at the face of the drift, where we saw the same rich ore in sight going west on into the mountain, we saw something that we shall not soon forget, and, we venture to say, can only be seen in the Big Creek antimony mines, 14 miles south of Austin. Superintendent Bray opened up this mud level in the mine the early part of last summer, and as soon as

the ground was in order for stoping extracting began. From this piece of ground, or since August last, the company has taken out about 400 tons of rich ore, and there is certainly more than this yet to take out before the level above is reached. In our somewhat inexperienced eyes it looked as though there was a mountain of rich ore in sight.

Wayside and Ornamental Trees.

An essay by A. L. BANCROFT of San Francisco and Contra Costa, read at the February meeting of the State Horticultural Society.

As the traveler moves along the roads of Central and Northern California, even in the more thickly settled and level portions of the farming country, the appearance of the roadsides is, as a rule, far from pleasing. Barbed wire and split picket fences border the roads, and the dry grass on the margins, in the summer, is heavily coated with brown. The roads themselves are deep with the finest of powdered dust, which rises in clouds as the heavy teams stumble and kick their way through it.

The passing of the homes of the "Dago," "Portigee" or family from the Fatherland or the Emerald Isle which have intruded themselves upon us within the generation does not give much relief to the somber hue of the surroundings. The front yard may be a horse or cow corral and the flower garden a pig-sty. The road in front of the house is likely to be occupied with the hay-wagon, a cultivator out of season or a broken-down thrashing machine.

Nor does the approach to a schoolhouse and grounds where the buds of the family should blossom into beautiful youth and vigorous, healthy young man and maidenhood raise the spirits of the depressed traveler to any great extent. The yard is more than likely to be bare and brown and be occupied by promiscuous and scattering groups of horses, carts, harness and saddles belonging to the children who come from a distance. The base of the house shows the marks where last winter's mud was rubbed off by the bands of roving hogs. The ever-present and necessary out-buildings, bare and bold, occupy the farther corners of the yard. And this is where our children are to spend much of their week-day time!

As we pass along, a few trees may be seen—some alive, vigorous and beautiful, but often the remains of many which died young, showing good impulses on the part of the land-owner, but also indicating weariness in well-doing or ignorance as to the means to be taken to score a success in this direction. These failures are many times pitiable to see.

Much of this might be and should be better. Some shade and ornamental trees near the roads; a short stretch of painted fence in front of the houses with flowers and shrubs in the yards; sprinkling the roads where the condition of the country and the travel upon them would justify it, are things which would help. The naming of the roads, the systematic numbering of the country houses, naming of the home itself, are influences which tend in the right direction in such progressive efforts.

The school grounds should be models showing what it is possible to do in the line of ornamentation—experimental grounds where the children would not only have their beauty to enjoy, but would be surrounded constantly by object-lessons, which would teach them how to produce similar results at their homes. California is a large State, and certainly from six to ten acres of it is not too much to devote to each of its country schools. The grounds should be divided into three enclosures. A small one enclosing the building should be filled with shrubs, flowers and a few trees artistically planted and highly cultivated, each child having a few square feet assigned it, the work upon which should be done entirely with its own hands. The larger scholars could also help upon the work about the grounds. Most of them would gladly spend an hour after school occasionally at such work if led and instructed by the teacher or a competent gardener. Upon one side there should be an enclosure for the horses ornamented with a line or several lines of trees and shrubs fenced off along the front and on the side next to the school. Shade trees and water for the animals should be provided and also a building for sheltering the carts and in which to store the horse traps. Upon the other side of the school-building should be the playground, with room enough for baseball, football, etc., for the boys, and more sheltered spots for lawn tennis, croquet, etc., for the girls' outing. Some fruit trees in this enclosure would not be out of place.

It is said that where flowers have been set out about schoolhouses that the appreciative visitor takes not only the flowers in bloom, but the plant—root and branch as well. The ideal country schoolhouse would be one that would have a library large enough and filled with books to interest all, both old and young, in the district; to have a general meeting room which could be lighted and warmed during the winter evenings, where any and all could gather and spend their evenings. In fact, make of it a country clubhouse. With a family living in the house to care for it, the flowers and plants in the grounds would be safe from the intruder.

The present California road law provides as follows:

May Plant Trees.—Section 2633. Any owner or occupant of land adjoining a highway not less than three rods wide may plant trees in and along said highway on the side contiguous to his land. They must be set in regular rows, at a distance of at least 20 feet from each other, and not more than six feet from the boundary of the highway. If the highway is more than 80 feet wide, the row must not be less than six nor more than twelve feet from the boundary of the highway. Whoever willfully injures any of them is liable to the owner or to the occupant for the damage which is thereby sustained.

This to some extent gives shape to what may be done in planting wayside trees. Of course, all may do as they like along their frontage inside of their own lines.

Kinds of Trees Available.—Some of the kinds of trees having but little or no economic value which would be available, would be the Blue Gum, Monterey Cypress, Monterey Pine, Locust, Osage Orange, Pepper, Lombardy and Carolina Poplars, Cork Elm, European Pine, Texas Umbrella Tree, Acacia, Native Laurel, Eucalyptus-diversicolor and E. Polyanthem. It is also said that some of

the slow-growing hardwood trees of the East will do well in California, such as the Maple, Elm, etc. The Eucalyptus Globulus may be made to contribute to the fuel supply by planting them upon a division or cross line, or as a wind-break. By setting them quite near together, say about eight feet, after the trees are about five or six years old every alternate one could be topped about 12 or 15 feet above the ground. The tops can be used for firewood, and a new growth will soon replace the old one, and the trees will become more stocky. In say three years those left growing can, in their turn be topped and then each five or six years the tops of half of them can be taken for fuel without affecting the vigor of the tree. Each time the cut should be a few inches lower than the previous time.

In some parts of Germany the roads are lined with German prune trees. They belong to and are cared for by the road management. When the fruit upon them is well advanced the crop is sold at auction and the proceeds go to the road fund.

While we in America would naturally not manage the thing in this way, there appears to be no reason why the owners of frontages upon the public country roads should not set out trees upon them which would combine beauty and usefulness, and retain all of the crop, which the passers by would allow, for their own use. There is available for this use the California Walnut, the same tree worked over to the English Walnut, the several varieties of chestnuts, almond, olive, cherry, prune, crab apple, fig, etc. For ornament the manner of pruning the roadside trees would naturally be somewhat different from that used in the orchard; but they can be pruned for ornament and still produce a fair crop. No more beautiful tree can be found than the olive, and the crop should be a material item. The crops from such wayside trees should pay for the cost and care of the trees and a profit besides. In the no-fence counties, where feasible, the fences should be removed in order that the trees may be cultivated on both sides. This leaves no uncultivated strip to dry out and furnish a harbor for gophers, squirrels and weeds. Evergreens should be avoided upon the south side of roads running east and west, as the shadows cast upon the roads will keep them muddy during the wet season.

The Care of Trees.—The only places in California where some kind of an ornamental tree cannot be made to grow is where it is all rock or all water, or where the soil is impregnated with salt or strong alkali. Care, however, is required in establishing them in their new location. The boles should be large and the soil be well pulverized, and the surface soil filled in first when the trees are set. The trees should be set so that they will be but about an inch deeper after transplanting and the earth becoming settled, than they were when standing in the nursery rows. Now, trees, in order to grow, require moisture. It must either be "kept up" by cultivation, or the trees must be irrigated. Many trees, like the Eucalyptus, Cypress, Pine, Pepper, etc., will take care of themselves, and do well without either cultivation or irrigation, provided they are watered by hand and the soil stirred at times during the first one or two years while the roots are striking down and establishing themselves.

The way to water young trees is to dish out the ground about them so that it will hold a whole bucket of water. Give each one a full bucket or more. The following morning stir the damp soil and cover with fine, dry dirt to prevent cracking and drying out. They will require no further attention for a week or ten days. The second year they should require less attention, and by the third year should be able to get along well without anything further than an occasional stirring of the soil to keep it well pulverized and to keep the weeds down and thus prevent them from drawing the moisture from the soil, which the trees themselves require.

Co-operation.—In wayside ornamentation, if the people of a school district would organize and improve the school grounds, cemeteries and roadsides of the entire district; or of the roads in front of the places owned by the members, and have some one competent person superintend and direct the whole work, better results would probably be obtained for the amount of time and money expended, than in any other way. The situation, as a whole, could be considered, and while a variety of effects could be secured, it at the same time could be made a harmonious and pleasing whole.

No Need of Salting the Mine.

Charles F. Danford of Boise city, Idaho, is at the Sherman House, Chicago, and tells the *News* the following:

"I used to be a miner away down in the southwest corner of Idaho," said Mr. Danford.

"We had a big mining camp down there between Topaz and Squaw Creek, and it was as tough a camp as you'd wish to meet in a day's walk. There were two great partners in the camp known simply as Bill and Joe. You never saw two such close friends—they ate, drank, slept and worked together. Joe and Bill had a claim about a mile from camp. Of all the fellows in the camp they had had the worst luck. Their mine scarcely paid their whisky bill, to say nothing of their losses at poker. The poor boys were notorious for their bad luck. Finally they concluded our camp was a 'Jonab' for them and that they would sell out and leave. Of course, they couldn't sell such a dead mine in our region, so they decided that Bill should travel to parts where it had never been heard of and endeavor to 'unload' the mine, while Joe should stay and continue work. Before Bill departed they between them fixed up a lot of the most monstrous and seductive lies ever dreamed of.

"Bill sallied forth, armed to the teeth, as it were, to snare the unwary, and his glowing description of their mine nearly landed a purchaser a time or two. Joe worked away patiently at the mine. Finally one day, about a week after Bill had left, he struck it rich. He rushed to the telegraph office and sent the following message to Bill:

"Dear Bill: Don't sell the mine. Our lies are all true. Joe."

ROSE'S
Modern Steam Engines
UP TO DATE.
A NEW,
REVISED and
ENLARGED
JUST READY. EDITION.

Modern Steam Engines. An Elementary treatise upon the Steam Engine, written in plain language for use in the workshop as well as in the drawing office, giving full explanations of the construction of Modern Steam Engines, including diagrams showing their actual operation, together with complete but simple explanations of the operations of various kinds of valves, valve motions, link motions, etc., thereby enabling the ordinary engineer to clearly understand the principles involved in their construction and use, and to put out their movements upon the drawing board. By Joshua Rose, M. E. Illustrated by 433 engravings. A New, Revised, and Enlarged Edition. 351 pages, 4to. Price, \$8.00.

By mail free of postage, at the publication price, to any address in the world.

BY THE SAME AUTHOR.

Mechanical Drawing Self-Taught. Complete Instructions in the Selection and Preparation of Drawing Instruments, Elementary Instruction in Practical Mechanical Drawing; together with examples in Simple Geometry and Elementary Mechanism, including Screw Threads, Gear Wheels, Mechanical Motion, Engines, and Boilers. By Joshua Rose, M. E. Illustrated by 330 engravings. Fourth edition, thoroughly revised and corrected. 8vo. 303 pages. Price.....\$4.00.

The Complete Practical Machinist. Embracing Lathe Work, Vise Work, Drills and Drilling, Taps and Dies, Hardening and Tempering, the Making and Use of Tools, Tool Grinding, Marking out Work, etc. By Joshua Rose, M. E. Illustrated by 356 engravings. Fifteenth edition thoroughly revised and in great part rewritten. 12mo. 439 pages. Price.....\$2.50.

The Slide Valve Practically Explained. Embracing Simple and Complete Practical Demonstrations of the Operation of each element in a Slide Valve Movement. By Joshua Rose, M. E. Illustrated by 35 engravings. 12mo. Price.....\$1.00.

Steam Boilers. A Practical Treatise on Boiler Construction and Examination. For the use of Practical Boiler Makers, Boiler Users and Inspectors; and embracing in plain figures all the calculations necessary in Designing and Classifying Steam Boilers. By Joshua Rose, M. E. Illustrated by 73 engravings. 8vo. 250 pages. Price.....\$2.50.

Illustrated Circulars, giving the full tables of contents of all the above works, sent free to any one who will apply.

The above or any of our Books sent by mail, free of postage, at the publication price, to any address in the world.

Our new revised Descriptive Catalogue of Practical and Scientific Books, 88 pages, 8vo, and our Catalogue of Books on Steam and the Steam Engine, Mechanics, Machinery, and Dynamical Engineering, and other Catalogues, the whole covering every branch of Science applied to the Arts, sent free and free of postage to any one in any part of the world who will furnish his address.

HENRY CAREY BAIRD & CO.,
INDUSTRIAL PUBLISHERS, BOOKSELLERS and IMPORTERS,
810 Walnut St., Philadelphia, Pa., U.S.A.

A Great Repository of Practical and Scientific Information.

One of the Fullest, Freshest and Most Valuable Handbooks of the Age. Indispensable to Every Practical Man.

Price \$2.00.

Free of postage to any address in the world.
THE TECHNO-CHEMICAL RECIPE BOOK:

Containing Several Thousand Receipts, covering the Latest, most Important, and most Useful Discoveries in Chemical Technology, and their Practical Application in the Arts and the Industries. Edited chiefly from the German of Drs. Winckler, Eisner, Heinze, Mierinski, Jacobsen, Koller, and Hülshagen, with additions by Wm. T. Brand and Wm. H. Wahl, Ph. D. (Heid.), Secretary of the Franklin Institute, Philadelphia. Illustrated by 78 engravings. One volume. Over 500 pages, 12mo, elegantly bound in scarlet cloth, gilt, closely printed, containing an immense amount and a great variety of matter.

Price \$2.00, free of postage to any address in the world.
A circular of 32 pages, showing the full Table of Contents of this important Book, sent by mail free of postage to any one in any part of the World who will furnish his address.

Mechanical Progress.

Large Ocean Steamers.

Those who are interested in fast passages across the Atlantic may expect to see the record made by the City of Paris last October (5 days, 14 hours, 24 minutes) lowered by several hours, says the New York *Advertiser*. Two new steamers are to be added to the service of the Cunard line. One, named *Lucania*, is to be launched today at the yard of the Fairfield Company at Govan, near Glasgow. The other, the *Campania*, is nearly ready. These two vessels are to commence running in May.

They are sister ships, and have taken nearly two years to build. All the work on them has been carried out with the utmost secrecy, especially the construction of the boilers. They will be the largest vessels that cross the Atlantic, and have been built with the idea of winning the records back again for the Cunard line.

These two vessels were built alongside of each other on the Clyde, and at such an angle that the launching will be down stream instead of diagonally across. Their lines are very fine, and at a glance they look more like two mammoth yachts than like merchant steamships. Their dimensions are: Length over all, 625 feet; breadth, 65 feet; depth, 41 feet, and nearly 13,000 tonnage measurement. Compared with the *Majestic* and *Teutonic*, they are 20 feet longer and 7 feet broader. The bottoms of the steamers are not quite flat, but are slightly rounded. The bows run up into what appears to be a topgallant fore-castle, which will show a considerable "flam" to throw the sea off when the huge ships are driven at full speed in head seas. The stems of both are plumb and the sterns are elliptical in form. They are constructed with double water-tight bottoms, into the compartments of which sea-water can be pumped for ballast. In addition, a false bottom runs fore and aft the whole length of the steamers. The false bottom is ten feet above the keelson, and rests on bulkheads which form a series of tanks, which will be used for holding fresh or salt water as required, giving additional security in case of accident.

The *Lucania* and *Campania* have two smokestacks and four masts each. The raking masts add to the yacht-like aspect. The smokestacks are each 26 feet in diameter. To give an idea of their size, about 25 persons sat down to lunch one day in one of the sections of the smokestack while it was lying in the Fairfield yards.

The engines are said to be the most powerful and perfect pieces of machinery of their kind ever constructed. They are of the triple-expansion type, of at least 50 per cent more indicated horse-power than the *White Star Line* steamers. They have twin screws, each screw worked by an independent set of engines. They will develop at least 25,000-horse power, which is generated by steam from 13 boilers heated by 100 furnaces. Each set of engines is to have three cranks, with five cylinders, namely, one high and one low pressure on the forward crank working tandem, one intermediate pressure on the middle crank and one high and one low pressure on the after crank. It is hoped that the speed will range from 22 to 22½ knots per hour, which will mean a minimum passage of about five days and four hours across the Atlantic. The arrangements for the twin screws are to be on the bracket system, as on the City of Paris.

Each vessel will accommodate 450 first-cabin passengers, 250 second-cabin and 600 steerage. The saloon of each ship will be unique. All of the 450 cabin passengers may sit down at one table. The saloon will be ten feet in height, or two feet higher than that of the *Etruria*, and will be 50 per cent larger than the *Etruria's* saloon. It will be finished in mahogany, with the ceiling paneled in white and gold and studded with electric globes. A stained-glass dome rises from the center of the saloon to a height of 25 feet from the floor.

The drawing-room is on the promenade deck and is finished in satin wood. Farther aft on the same deck is the library and reading-room with walls and ceiling of mahogany, a handsome, curled, mottled wood, and mahogany. The fittings, like the interior decorations of the ships, will be different from any other steamship afloat.

A. J. Macginnis, an engineer, recently said in a paper on "Transatlantic Steamships," read at a meeting of the Liverpool Engineer Society: "In 1878 the *Britannic*, to make a 7 days 11 hours eastward passage, indicated 5100-horse power and consumed 100 tons of coal a day. In 1887 the *Etruria*, to make a 6 days 2 hours outward passage, indicated 13,500-horse power and consumed 320 tons per day. In 1889 the *City of Paris*, to make a 5 days 19 hours out-

ward passage, indicated 18,000-horse power and consumed 300 tons per day. In 1891 the *Teutonic*, to make 5 days 16½ hours outward passage, indicated 17,000-horse power and consumed 300 tons per day. The new *Cunarder*, to make a 5 days 4 hours outward passage, will indicate 26,000-horse power and will consume 410 tons of coal a day.

"It will thus be seen that to gain two and a half days on the passage, it will be necessary to multiply the horse-power by five, and the daily consumption of coal by four, notwithstanding that at least 25 per cent more efficiency is gained from the fuel by the adoption of the triple-expansion engines."

Displacement of Laborers in Steel-Making.

An intimation of the extent and magnitude of the displacement of physical labor by the invention of machinery is obtained by the perusal of an interview with John Coyle of Homestead, who recently visited Chicago in the interest of the men now accused of various unlawful acts in connection with, and growing out of the strike of last July. The interview was printed in a Chicago paper, which makes Mr. Coyle say:

"Iron was formerly brought to the mills as pig iron. Under the new inventions it will be sent in a molten state. Each department handling the pig iron formerly included four piumen, four chargers, two shovelers, two helpers, ladleman and helper, steel-melter, weighmaster and two unloaders of ore from cars. There were two shifts daily, and eight of these furnaces in each department. The work of each furnace under the new machinery will be done by five men—a melter, helper, ladleman and two pitmen. This renders 148 men idle.

"In the converting mill, where metal is converted into Bessemer steel, men work eight hours a day—three shifts. There are 20 wheelers of metal to each shift, five cinder "snappers" or pullers and 20 carts and drivers, all rendered idle, for machinery will do all this hereafter. These men are crowded out by machinery. The setting of the moulds in place, formerly done by six men, will hereafter be watched after by a boy and a machine."

"In the 28 inch blooming mill, by the introduction of a hydraulic press for the pulling of ingots out on tables, 15 men will be rendered idle.

"On the rolls where steel is rolled to any shape desired, a machine called a 'go-devil' will replace 20 men.

"In the old beam mill one-third of the number of men will be enabled to do more work in five hours with the new machinery than the full force formerly could do in 12 hours. This will replace 200 men, known as chargers, heaters, hot-bedmen, helpers and shearmen. All the details are thoroughly done by the machinery.

"In the new beam mill, machinery improvements will be introduced in what is known as the 'open hearth,' which will do the most intricate work, and will displace 40 men.

"New machines will be introduced for unloading metal from the cars and laying it on the charger in the furnace. This will throw out 25 men. In small structural work, such as angles, channels and bars, scores will be thrown out of work by ingenious machinery. In the ten-inch mills a few will be out of work.

"In the armor plate, and in the 110-inch mills and the small plate mills, intricate machinery will be introduced this year that will displace many men. There is not a branch of the steel making industry which will not see machinery crowd out scores of manual laborers this year. Some of the machinery is said to be the most ingenious ever constructed. It will effect results in the making of steel that no one would have believed possible of manufacture, except the most skilled mechanic."

The Illinois Steel Company is also introducing labor-saving devices that will displace 500 manual laborers.

MOTTLED IRON.—A process of mottling iron, recently brought to notice, is as follows: The iron parts to be case-hardened are brightly polished, care being taken to remove all grease. They are then placed in an iron box, and covered either with bone-dust or old leather that has been burned. The box is then placed in a brisk fire and allowed to remain about one hour or until no doubt remains that all parts of the iron are heated to redness. The contents of the box are then dumped quickly into water. This operation requires great care, as the air must not strike the iron before it reaches the water. Special apparatus and practice are necessary to give the iron the desirable blue-gray mottled color, for if the air touch the iron it assumes a black or blue-black

streaked hue accordingly as the experiment is more or less imperfect. After the case-hardened iron is cooled, it is varnished, and the operation is complete.

Scientific Progress.

Cloud Classification.

Capt. David Wilson Barker writes to *Science* as follows:

For some years meteorologists have been in doubt as to the nomenclature of clouds, greatly to the retardment of this important and practical branch of the science. The nomenclature of Luke Howard answered very well for a time, but with our advanced knowledge it scarcely answers at all. It is not simple enough for beginners, nor elaborate enough for those well advanced. Many of the systems proposed lately are simply modifications of this old nomenclature, and retain its faults. Unfortunately, in cloud classification, we are met with many difficulties at the outset; we cannot collect and label clouds in a cabinet for reference, but here photography may aid us much. From personal experience, it has been found quite possible to portray even the most delicate and fleecy clouds with sufficient accuracy to leave no doubt as to their type. It is proposed in this article to lay before the readers of *Science* a simple scheme of cloud nomenclature suitable for beginners and those unable to devote much time to the study. On this simple scheme can be founded a more elaborate system for skilled nephologists.

It will soon strike any one who notices weather phenomena ever so casually, that clouds have a tendency to assume one of two well-known forms or shapes, either a heavy or globular form, or that of thin sheets or layers. Clouds in the first form are known as cumulus (cumulus, a heap) clouds. In the second as stratus (stratus, a layer) clouds. Once it is clearly understood that all clouds be divided into these two types as a starting-point, and belong to one or other of these types, the question of a minute subdivision becomes, comparatively speaking, easy.

It may be well to give here a cloud definition. A cloud is vapor, which has ascended or descended in the atmosphere from a position having a temperature or density greater than the portion of the atmosphere it ascends or descends to, which is then unable to retain it in its invisible form. According to the physical state of the position it is attracted to, so will be the form it will assume on becoming condensed. It will be seen from this that the shape of a cloud is more or less determined by its physical surroundings, and consequently it affords a valuable index, not only to the state of the immediately surrounding atmosphere, but also to the weather we may expect, and this frequently some time before any instrumental warnings are indicated.

Cumulus is essentially the cloud of the lower atmosphere, as, although it sometimes tops to great altitudes, yet its formation commences at a comparatively speaking, low level. Cumulus clouds assume varied and fantastic shapes, and vary very often from clouds of enormous extent to small nubecules; still, there is in them a distinct and marked similarity, which must be easily recognized. There are three forms of cumulus clouds from which rain falls, viz.: 1. Bold, massive cumulus with feathery tops, which appear to be composed of ice crystals, and are like the high variety of stratus known as cirrus. 2. Bold, massive cumulus with all clearly defined borders, only seen in the tropics. 3. Fleecy, ill-defined cumulus. The first may be accompanied by either snow, hail or rain, with a decided increase of wind, and, in fact, is a squall, which often gives warning hours before it reaches the observer. In the second is heavy rain with little increase of wind force, and, at sea, is the kind of cloud which sometimes accompanies waterspouts; and the last has only drizzling rain with no increase in wind force.

Stratus is formed in all layers of the atmosphere. On the ground it is fog, in the lower atmosphere as covering the sky often-times for days in anti-cyclonic areas; in the middle layers in broken-up or more or less circular patches, constantly though erroneously called cirro-cumulus or cumulo-cirrus, and in the highest layers as the well known cirrus or curl-cloud. It is a cloud of the finest settled weather, and also of the front of cyclonic disturbances, but there can be no mistaking these two conditions. In the former case it forms a pall over the whole sky, perhaps broken here and there by a rift, through which a blue sky, quite free from other clouds, may be seen, and appearing in all directions in lines parallel to the horizon. The first sign of any change is preceded by the disappearance of this cloud,

and the formation of fine threads of cirrus over the sky; these threads gradually grow closer and closer together until the sun or moon shines through surrounded by a halo. As the cloud grows thicker (seems to grow in the air), this too disappears, rain begins to fall, and a cyclonic disturbance is well under way. In the first case, the stratus was in the form of a cloud of great superficial extent and small depth; in the second, it has great depth and uniformity of texture.

Cloud-observing is a difficult branch of meteorology, yet no great advances can be made in the physics of the atmosphere until we have a better knowledge of its movements, and this article is written in the hope that those interested in the subject may not be appalled by the apparently hopeless condition of cloud nomenclature. For if we could have a series of observations taken carefully on even this simple basis, they would be of more value than the majority of observations taken now; and this especially applies to observations at sea, as it is to the sea we must look for the most valuable meteorological observations. Personal experience has shown that observers, while finding it comparatively easy to distinguish between cumuloform clouds and stratiform clouds and the different altitudes at which they float, yet often make great mistakes when they have to deal with the subdivisions as they are at present determined.

Metallic Chromium Obtained by an Electrolytic Process.

In a recent number of *Comptes Rendus*, Mr. E. Placet describes a new electrolytic process, by which he has succeeded in obtaining pure metallic chromium, which has formerly been but a laboratory curiosity, and in some cases was not pure chromium at all, but merely a more or less pure carburet of that metal.

To an aqueous solution of chromalum he adds an alkaline sulphate and a little sulphuric or other acid. In electrolyzing this solution beautifully brilliant deposits of pure chromium are formed on the negative electrode. Its properties are as follows: It is very hard, has a bluish-white color, resists atmospheric action, and is attacked only by concentrated nitric or sulphuric acid and concentrated solutions of potash. He said that this process may be applied on a commercial scale, which, if true, represents a very important step, as the alloys of chromium, notably those with iron and steel, are becoming of great importance.

He also states that he has succeeded in electroplating brass, bronze, copper and iron with desirable thickness of an adherent deposit of chromium resembling oxidized silver. At the time of reading his paper before the Académie he showed specimens of pure metallic chromium weighing over two pounds, and also samples of chromium alloys and brass ornaments electroplated with chromium.

BISMUTH.—At a recent meeting of the Royal Society, London, Mr. Edward Matthey, F. C. S., Assoc. Roy. Sch. Mines, read a paper on "Further Researches in Connection with the Metallurgy of Bismuth." In melting large quantities of bismuth containing arsenic it was found that on the surface of the metal being exposed to the air arsenical fumes appeared, and that as the temperature of the metal was raised the arsenic came off in dense white fumes (As₂O₃). An alloy of bismuth containing 0.65 per cent of arsenic was carefully operated upon and freed from the whole of its arsenic contents, the temperatures being noted at which the separation takes place. When raised to a temperature of 513° C. and maintained at this for a short period, the bismuth was found to be absolutely free from arsenic. Whilst engaged in fusing some 400 or 500 kilogrammes of bismuth containing antimony it was noticed that a peculiar oily film formed on the surface of the alloy, which on being removed and tested was found to contain a considerable percentage of antimony. By continuing the operation and removing the film from time to time as it formed, the melted metal became bright, and was then found to be perfectly free from antimony. A quantity of about 350 kilogrammes of bismuth containing 0.80 per cent of antimony was melted and the temperature observed at which the antimony separated as described. By maintaining a constant temperature at 458° C. the whole of the antimony separated, leaving the bismuth free from any trace of this metal. The temperatures were determined by the pyrometer of Mons. H. le Chatelier.

A GLASS FACTORY at Liverpool has "glass floor boxes for all its machinery, a glass floor, glass shingles on the roof and a smokestack 105 feet high built wholly of glass bricks each a foot square."

CHEMICAL APPARATUS.
68 & 65 First St., cor. Mission, San Francisco

We would call the attention of
Assayers, Chemists, Mining Com-
panies, Milling Companies, Pros-
pectors, etc., to our full stock of
Balances, Furnaces, Muffles, Crucibles, Scor-
ifiers, etc., including, also, a full stock of
Chemicals.
Having been engaged in furnishing these sup-
plies since the first discovery of mines on the
Pacific Coast, we feel confident from our experi-
ence we can well suit the demand for these
goods, both as to quality and price.
Agents for the Morgan Crucible Co.,
Battersea, England. Also for E. G. Den-
ston's Silver Plated Amalgam Plates. The plates
of this well-known manufacturer are thoroughly reli-
able, and full weight of Silver guaranteed. Orders taken
at his lowest prices. Our Illustrated Catalogue and As-
say Tables sent free on application.

JOHN TAYLOR & CO.

NEW DISCOVERY.
Mines Revived and Miners Enriched
By the wonderful MacArthur-Forrest Process,
Controlled by The Gold and Silver Extraction Mining
and Milling Co., H. A. W. Tabor, Pres.; Leonard Gow,
V. Pres.; H. A. Jones, 24 V. Pres.; P. Gro. Gow, Techni-
cal Mgr., and Asst. Treas.; T. L. Wiswall, Gen'l Mgr.,
and Sec.; Peter McCourt, Treas.; W. L. Cooper, Eng.

TRADE MARK.
The Cassel Gold Extraction Co.,
Limited, of Scotland,
also in Australia, South Africa,
New Zealand, Queensland, Etc.,
GLASGOW WORKS

General Office of Company:
Rooms 8, 9 & 10, Tabor Grand Opera House
Block, DENVER, COLORADO.

Also mills in operation as follows, viz: The Denver Mill,
Denver, Colo.; The Livingston Gold Mining Co., Boulder
Co., Colo.; The Puzzler Gold Mining and Milling Co.,
Boulder Co., Colo.; The Grapple Creek Gold Extraction
and Power Co., Colo.; Calumet Gold Mining Co., Middle
Creek, Shasta Co., Cal.; The Shasta Gold Ex. Co., Mid-
dle Creek, Shasta Co., Cal.; The Mercu Gold Mining
Co., Fairfield, Utah; Champion's Mines, Humburg Dis-
trict, Yavapai County, Ariz.; The Crowned King and
Last Chance Mine, Yavapai Co., Ariz.; The Union Mines,
Maricopa Co., Ariz.; The Revenue Gold Mining Co.,
Revenue via Norris, Mont.; The Craigmont Mining &
Milling Co., Creighton, Cherokee Co., Georgia; and
others in course of erection.

The object of this company is to introduce the Mac
Arthur-Forrest process.
We have purchased from the Cassel Gold Extraction Co.,
of Glasgow, Scotland, the exclusive right for the
United States to use patents covering this process.
If you desire an experimental test communicate with the
secretary.
If the results of the tests are favorable, we will then
make arrangements to treat a quantity of not less than
five tons at Denver.
We are fully prepared to grant royalties to mine and
mine owners, or rights covering districts and counties.
The process consists of pulverizing the ores to a fine-
ness of about 60 mesh, and then subjecting the same to
an action of a very diluted solution of cyanide. A few
tubs specially constructed according to our diagrams,
for triturating, settling and filtering, is all that is re-
quired extra in connection with any kind of pulverizing
stamp or rolls.
The total cost, as a rule, does not exceed from \$2.50
to \$5.00 per ton.
The most desirable class of ores for this process
the so-called refractory gold ores, pyrites, hematites
manganese and tellurium. We have also treated suc-
cessfully dry silver ores.
We will be pleased to answer any inquiries and fur-
nish any desired information. Address,
T. L. WISWALL,
P. O. Box 926. Gen. Mgr. and Secretary.

Electricity.

Thermal Storage.

In the course of the first of his series of Howard lectures at the Society of Arts in London recently, Professor Unwin made the first public mention of a very important invention known for some time to a few, and likely to have a bearing on the economic generation of electricity, whether in large or small installations. It is the invention of Mr. Druitt Halpin, and, according to the *Engineer*, consists in the storage of the continuous thermal work of one or a small number of boilers to do the work of several or a large number of boilers for short periods. That is to say, that he meets the difficulties which bring about a low load factor, and with an ordinary load diagram he is able to meet the varied demand on the part of engines and generators with a uniform or straight-line load diagram as concerns the boilers. His system is one which is equally applicable for continuous and for alternating current stations, and in many cases it will make secondary batteries unnecessary except in very small numbers. At the present time it is necessary in electric generating stations to provide sufficient boiler power to meet the maximum demand or the highest part of the load diagram. This only, even if we make its mean, represents about one-sixth to one-fourth of the 24 hours; yet boilers must be provided, and fires either lighted up or banked up to meet this short period, the boilers themselves being sufficient to meet the maximum demand continuously. This not only enormously increases the fuel consumption, but it makes capital expenditure high and the unit cost of current very much higher than if produced with boilers always working at full load. To avoid these difficulties and losses, Mr. Halpin, under this thermal storage system, employs boiler power of about one-sixth to one-fourth the maximum load.

These boilers he works continuously at their best and most economical rate of evaporation. During those of the 24 hours when the generating station demand is small, the thermal work of these boilers is stored by passing the water which they heat into a sufficient number of plain storage tanks, protected from loss by radiation or conduction. The boilers which he employs will work at a pressure of, say 250 pounds on the square inch, and will be what we may call flooded boilers; that is to say, there will be no steam space within them. The storage tanks will, of course, also be worked at this pressure, but by very well-known arrangements steam will be taken from them when the engines are working at a pressure of, say 130 pounds. During the time of maximum load the water level in these tanks will fall by conversion of heated water into steam, and the level will again be made up during the fall to minimum demand.

The storage tanks will be the equivalent of the gas-holders in a gas-supply system, and in number will be sufficient to give a capacity of about 14 pounds of water per pound of steam required during the period of demand which is above the mean load. The estimated cost of this arrangement is less than that for a sufficient number of boilers, and a saving on the present cost of steam production in some of the well-known generating stations will, it is said, probably be from 40 to 50 per cent, so great is the loss of fuel during the time when boilers are under fire with closed stop-valves.

Mr. Halpin's system has never been employed in electric work, but the enormous cost of fuel per electric unit under existing circumstances, as compared with the easily practically possible 2½-pounds of coal per unit, shows how much it is wanted and how completely it has escaped all previous inventors, yet the principle upon which it is based is old, and has received various applications. It is another of that important class of inventions which employs old means in new combinations and applications to the public benefit.

ELECTRIC FURNACE.—A new furnace described in the London *Engineer* consists of two bricks of quicklime, one upon the other, the lower one of which is provided with a longitudinal groove, which carries the two electrodes, and between them is a small cavity, serving as a crucible, which contains a layer of several centimetres of the substance to be experimented upon. The latter may also be contained in a small carbon crucible. The highest temperature worked with was 3000 degrees C., produced by a current of 450 amperes and 70 volts, consuming 50 h. p. In the neighborhood of 2500 degrees, lime, strontia and magnesia crystallized in a few minutes. At 3000 de-

grees the quicklime composing the furnace began to run like water. At the same temperature the carbon rapidly reduced the oxide of calcium to the metallic state. The oxides of nickel, cobalt, manganese and chromium were reduced in a few seconds at 2500 degrees, and a button of uranium, weighing 120 grains, was obtained from the oxide in ten minutes at 3000 degrees.

Measurement of Light.

A beam of light has two other qualities besides that of illuminating a dark surface. It can be shown to possess more or less heat rays; also, that if certain compound substances are interposed in its path, chemical decomposition takes place. It is pointed out by the *Electrical Engineer* that were the three portions of the beam, viz., the thermal, the luminous, and the actinic or the chemical rays always united in the same proportions, we should have no difficulty in constructing a photometer accurate in its measurements and independent of the want of sensitiveness in the eye; for we could on the one hand use a thermometer, or a thermopile and a delicate galvanometer; or on the other hand a piece of sensitized paper such as is used in photography. But unfortunately the proportions vary considerably.

Tyndall has ascertained, as the result of a long series of carefully performed experiments, that the luminous rays from several sources of light bear but a small proportion to the obscure or non-luminous rays, the exact proportion of the former being, from

An oil flame.....	3	per cent.
A gas flame.....	4	"
A white-hot spiral.....	4.6	"
An electric-arc light.....	10	"

The arc light appears here as the richest in luminous rays; it is also the richest in actinic rays, but the poorest in thermal rays. The various proportions differ, however, to some extent with different carbons, etc. The experiments demonstrate that, if either the thermal or the actinic rays are to be utilized for ascertaining the luminosity of electric lamps, they can only be compared together, or among themselves; they cannot fairly be compared with an oil or gas flame.

ELECTRICITY AND FIRES.—Quite a change is noticeable of late in the attitude of insurance companies toward electrical interests. While the underwriters are not less vigilant in their efforts to keep up a high standard of construction, they do not display the opposition to electric lighting that formerly marked their policy. This can only be explained by the fact that they are beginning to realize the advantages of the electric light over other forms of illumination in the matter of safety. They are certainly justified in this change of policy if statistics have any value. Official reports of chiefs of fire departments in 82 cities of this country, having a population of 20,000 or over, show that during the year 1891 there were 18,118 fires from all causes, only 225 of which were attributed to electric lighting and power circuits. A comparison of the losses is equally interesting. The total value of property destroyed in all the fires reported was \$21,357,539.95, while only \$216,899.75 could be charged to the fires caused by electric currents. This is certainly an excellent showing and one that will appeal to every business man. It has always been claimed by the advocates of electric light and heat that with proper construction the fire risk would be reduced to a minimum where electricity was employed. And now they are supported in this position by official statistics, compiled from reports prepared by disinterested persons.—Western Electrician.

FUSING ALUMINA.—The process used at the aluminum factory in Neuhausen, Switzerland, is described by Mr. Wedding as follows: "Pure alumina is fused and then decomposed by an electric current. The vessel in which this takes place consists of an iron box lined with charcoal, forming the negative terminal. The positive terminal is formed of a number of carbon rods, placed vertically and extending into the box. At the start, small pieces of copper are used and are fused by the current, after which alumina is added and the aluminum is run off into molds as fast as produced. In making bronze, the ingredients are all added in this vessel. The capacity of the plant is given as about one ton of pure aluminum per day.

A FIRM in Budapest, Hungary, makes lamps in which the filament has three layers, only the core of which is made of carbon. The filament is immersed in a solution of 25 to 30 per cent of water glass, 10 to 15 per cent of Senegal gum and 12 to 13 per cent caustic soda. After immersion, it is given its proper shape. The filaments are heated in a bath of paraffin or naphthalin. The

layer of silicate is said to be conducting, and is claimed to protect them during the process of carbonization.

Useful Information.

What Constitutes Good Vulcanized India Rubber?

An investigation has recently been conducted by Lieut. L. Vladimiroff, at the St. Petersburg Technical Institute, with a view to establishing rules or tests whereby the quality of vulcanized India rubber may be efficiently judged. It is a notorious fact that no method of chemical analysis gives reliable results for this substance. Hence, the tests applied were chiefly of a physical nature. From a lengthy series of experiments the following conclusions were deduced, namely:

1. India rubber should not give the least sign of superficial cracking when bent to an angle of 180° after five hours of exposure in a closed air bath to a temperature of 125° Centigrade. The test pieces should be six centimeters thick.

2. Rubber that does not contain more than half its weight of metallic oxides should stretch to five times its length without breaking.

3. Caoutchouc, free from all foreign matter except the sulphur used in vulcanizing it, should stretch at least seven times its length before rupture.

4. The extension measured immediately after rupture has taken place should not exceed 12 per cent of the original length of the test piece of rubber. The test piece should be from three to twelve millimeters long, three centimeters wide, and not more than six millimeters thick.

5. Softness may be determined by measuring the percentage of ash formed on incineration; it may form the basis for deciding between different grades of rubber for certain purposes.

6. The vulcanized rubber should not harden under the influence of cold temperature.

These conclusions are to serve in the establishment of rules governing the introduction of vulcanized rubber in the Russian navy.—The Electrician.

COMPOUND LOCOMOTIVES.—At a recent meeting of the German Association of Engineers, the chief of the locomotive department of the Prussian State Railway stated that the trials of the compound locomotive by the Prussian Government indicate the superiority of the compound over the simple system in the following points: Greater total amount of work performed, increased economy in the use of fuels, reduction in spark-throwing. At the International Railway Congress at St. Petersburg, the French engineers were not unanimous on the subject. The representatives of the French State Railways and of the Paris and Lyons Company asserted as their opinion that hitherto tests have practically shown that in countries where coal is cheap, the changing of ordinary into compound locomotives, or the building, at the outset, of compound locomotives, is not likely to lead to any advantage. Where coal, however, is dear, the building of new compounds, and the rebuilding of old single engines to work on the compound system, and the adoption of higher steam pressure, are advisable. With the two-cylinder compounds at least, it has been found that there is no increase in cost for oil, maintenance, etc., as compared with ordinary locomotives. Statistics were given, showing that the number of compound locomotives in use has been increased in less than three years from about 680 to 1858. The two-cylinder compound locomotives increased in number from 522 to 1731, the three-cylinder compounds from 99 to 108, and the four-cylinder engines from 59 to 379.

A New Rapid-Fire Gun.

A rapid-firing gun recently tested at New Haven by the Winchester Repeating Arms Company fired 900 shots a minute, says the *Age of Steel*.

It is the invention of Messrs. Browning Bros., of Ogden, U. T. The only gun approaching this rapidity is the Maxim machine gun, with a record of 750 shots per minute. The new besom of destruction has a water-jacket surrounding the barrel holding one gallon of water. This amount of water is evaporated in one minute when the gun is in operation. In experiments made without the water-jacket the barrel would become too hot for safety in less than half a minute. The ammunition is fed into the breech from a continuous web belt holding the cartridges in pockets.

The representatives of the Krupp, Arm-

strong and Canet guns have been engaged in a wordy tussle upon the respective killing capacities of these weapons. The initial velocity of the largest of these projectiles is now well beyond half a mile per second, and the penetrating energy varies from 200 to 300 foot-tons per pound of powder, with a momentum of about 80,000 foot-tons. That is to say, a mass of steel can now be hurled forth with a destructive power something like that of the average railway collision, but with what ultimate benefit to the human race it is not so easy to determine.

Canet claims to produce the same amount of damage as Krupp or Armstrong at half the money and with greater simplicity and elegance. This French gun has been adopted by the Japanese Government for three coast-guard vessels. That brave, though diminutive, people find it the only weapon which one of their naval officers can handle alone. There is no wedge for closing the breach, as in the Krupp gun, which requires considerable biceps. The opening lever is so facilitated by screw manipulation that under normal power pressures one man can easily work it in ten seconds.

PREPARATION OF VERMILION.—The *Rev. de Chimie Industrielle* describes the following process: In a wooden bath one meter in diameter and two meters high are placed circular shelves about six inches wide on which is placed metallic mercury about one-half inch deep. These shelves are connected with the negative pole of the dynamo. At the bottom of the vat is a plate of steel-plated copper connected with the negative pole. The solution contains eight per cent of nitrate of ammonia and eight per cent of nitrate of soda. Through a perforated worm placed in the bath sulphuretted hydrogen is introduced. Besides this, the bath contains agitators. On passing the current a precipitate of sulphide of mercury, that is, vermilion, is formed. Another method which is being tried is to use a bath containing 100 liters of water, four kilograms each of nitrate of ammonia, nitrate of soda, sulphide of sodium and sulphur. In this case one has only to add sulphur and mercury instead of sulphuretted hydrogen.

A PASSENGER STEAMER for the Fall River line on Long Island sound is being built at the Roach shipyards at Chester, Pa. This steamer is to be 440 feet long over all, 52½ feet beam, 93 feet wide over the guards, 20½ feet depth of hold, 12½ feet draft and 4500 tons displacement. Each of the double inclined engines will have cylinders 51 inches and 95 inches diameter, with 11 feet stroke. The side wheels will be of the feathering type, 35 feet in diameter and 14 feet face. The vessel will be 20 feet longer than the Fall River line steamer Puritan, the largest boat now running on the sound.

ON A BIG SCALE.—The timber used in the construction of the Chicago exhibition buildings is estimated to exceed 75,000,000 feet, which represents the wood from ten square miles of forest. All the buildings are covered with a composition of plaster, cement and hemp, and the amount of this work is equal to covering the wall of a four-story building 15 miles in length. The electric lighting will require 5000 arc and 93,000 incandescent lamps, which is about ten times as much electric lighting as the Paris Exposition was provided with.

FROM 1846 to 1860 the total number of patents granted was 26,234, an average of 1874 a year for the period. Last year the Patent Office granted 21,427 patents to American citizens, nearly as many as were granted in the whole period from 1846 to 1860.

20-Stamp Mill for Sale.

In Southern California, a 20-stamp Gold Quartz Mill, with engine, holler, self-feeders, rock-breaker, etc. As the premises are adjacent to Railroad, the Mill could be conveniently removed. Can be had at low price for cash. Address "Quartz Mill," care MINING AND SCIENTIFIC PRESS, San Francisco.

Sampling Works for Sale.

The works are situated at Daggett, Cal., in the Calico Mining District, and on side track of the Atlantic & Pacific Railroad. They contain a first-class 50-horsepower engine and 45-horsepower boiler with Ore-crusher and other machinery, Mill Scales, Assaying Outfit, etc., all nearly new. Also upon the premises an office building and a comfortable dwelling-house (portable). The above can be had at a bargain. Apply to JOHN H. GILLISBY, 1214 Stockton st., San Francisco.

Are You Going East?

Take the Santa Fe route. You will find it to your interest to call on or address the undersigned before purchasing tickets. No other line crossing the continent can offer you a trip combining equal comfort and pleasure. The only line running Pullman palace and tourist sleeping cars through to California on the same train every day without change. Personally conducted excursions through to Boston leave every Tuesday. DEWEY & CO.'S
Scientific Press Patent Agency.

ESTABLISHED 1863.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old
experienced, first-class Agency. We have able and trustworthy Associates and Agents in Wash-
ington and the capital cities of the principal nations of the world. In connection with our edi-
torial, scientific and Patent Law Library, and record of original cases in our office, we have
other advantages far beyond those which can be offered home inventors by other agencies. The
information accumulated through long and careful practice before the Office, and the frequent
examination of Patents already granted, for the purpose of determining the patentability of
inventions brought before us, enables us offer to give advice which will save inventors the
expense of applying for Patents upon inventions which are not new. Circulars of advice sent
free on receipt of postage. Address DEWEY & CO., Patent Agents, 220 Market St. S. F.

PUBLIC SALE
— OF A —
SILVER REDUCTION PLANT

THE TOMBSTONE MILL AND MINING COMPANY,
having no further use for its mills and furnace at
Charleston, will sell at public sale, on the property,

TUESDAY, MARCH 21, 1893, AT 3 P. M.,
To the highest bidder for cash: All of the property
known as "The Charleston Mills," real, personal and
mixed; consisting of one 20 and one 15-stamp silver mill;
one 25-ton water-jacket lead smelter; dwelling house
and other buildings; and including the land, mine,
ditch and water right pertaining thereto; situated on
the San Pedro river, nine miles from Tombstone, Cochise
county, Arizona.
Terms of payment will be made known at the sale
and ample time allowed to investigate the title to the
property.
By order of the Board of Directors of the Tombstone
Mill and Mining Company.
W. J. CHEYNEY, Secretary,
Tombstone, Arizona.

BUCYRUS, OHIO, U. S. A.

THE BLASDEL CONCENTRATING BELT COMPANY.

We are now having our new Improved
Concentrating Belt manufactured in San
Francisco. We keep always on hand
Belts suitable for the Triumph and Frue
machines, but can make any length or
width desired. The advantages of these belts over
any others will be readily seen by practical millmen.
First, the flanges or edges of our belt stand at an acute
angle inclining toward the center, and therefore readily
conform to the change of direction while passing over
the end rollers; thus the vibration and loss caused by the
frequent breaking of the flanges of the old style belt is
practically done away with. Again, our belts, at intervals
of two to four feet, have a very slight rifled surface for the
space of three inches, which tends to equalize the pulp
on the belt, and prevents it from banking on the sides and
forming channels through the center. These slight riffling
also save very fine sulphurets and the quicksilver that
would otherwise escape with the tailings from a belt,
the surface of which is entirely smooth. We can safely
say that it is a better concentrator belt than has ever
been manufactured. It will last much longer and
will handle more pulp. We also manufacture smooth belts with same flanges when desired.

H. G. BLASDEL, Jr., Manager, 419 California St., San Francisco.

OLADSTONE MINING COMPANY, C. J. Clark, M. E. Oen'l Supt. FRENCH OULCH, Calaveras Co., Cal., Dec 12, 1891.
 MESSRS. ADAMS & CARTER, San Francisco, Cal.—DEAR SIR: During my experience in mining and milling, I have used twenty-four of your four-foot Frue Vanners on different kinds of ore, both gold and silver. I have made competitive tests against them with other widely puffed-up concentrators and have always found the Frue in first place. When I built this mill (20 stamps), I determined to put in six-foot Frues in order to save space and machinery. I am now running four of your six-foot machines and they have been going for Twenty Months. They are taking the pulp from 20 stamps, crushing a minimum of fifty tons per day, and do better work than the four-foot tables. They require no more attention than a four-foot table and handle at least twice the quantity of ore. I have run them up to 80 tons per day and could not see that they were crowded. They stop and start as easily as the smaller tables and have the advantage of double capacity with the same bearings and wearing parts, requiring no more oil, and no more wear and tear than the smaller tables. My repair account for the past six months has been too small to mention. In order to give an idea of the work they are doing here I will state that the ore has varied monthly from \$5 to \$20 per ton and the tailings from nothing to 60 cts. per ton. I will conclude by saying that I cannot endorse the six foot Frue Vanner too highly, and it is the only table that I would have in my mill.
 C. J. CLARK, Oen'l Supt.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

HECTOR.—*Amador Record*, March 2: At the Hector mine the water is down to the top of the 900 station. It is expected to have the water drawn from, and men at work in, the 900 level next week. This is indeed good news. At the South Eu-ka mine the work of sinking progresses favorably, the average being about 20 feet a week. By Saturday night they will be 80 feet below the 500 level. At this rate of sinking, the 800 level will be reached about June 1st.

WILDMAN.—Foreman S. C. Higgins, of the Wildman mine, informs the *Record* that they are down to the 1100 level and will have the pump sunk and be ready to begin drifting on that level by the end of the present week. During the period of sinking from the 900 level the stations at the two levels below have been cut out and everything made ready for active explorations on the new levels. At present, but little, if anything, will be done on the 1000 level except to run a drift far enough to make a reservoir for the use of the big pump, which is to be lowered from the 900 level to that point. The surplus water from the lower level will be hoisted by the smaller pump to the reservoir above. A drift will be started at the 1100 level and be run on the gong for 40 feet to the south. At the latter point a crosscut will be made in a westerly direction to strike the ledge. The mill and everything connected therewith has been thoroughly overhauled. A new water-wheel has been put in place, and the stamps will be in readiness to drop by the time the new level is opened out. All the old bands, who were temporarily laid off during the sinking, will soon be working on full time. This means a good deal in a business way to Sutter Creek. Supt. John Tregloan has gone to San Francisco, but is expected home Saturday. The *Record* mentioned a couple of weeks ago that Supt. Tregloan had received several anonymous letters finding fault with the working of his mine. It now transpires that these letters were mostly made up of underhand attacks against Foreman Higgins and others of the most trusted employees of the Wildman mine. Of course, only a coward would adopt this backbiting method of getting even for fancied wrongs. Foreman Higgins, who is the particular target for these slanderous attacks, is an old resident of Amador county. Years ago he was night foreman in the Plymouth Consolidated when that mine was in its glory. For five years past he has been head millman or underground foreman at the Wildman under Supt. Tregloan. In each position he has fulfilled every duty and enjoyed the confidence of his employers, both as a miner of excellent judgment and as a man worthy of their respect. The same can be said regarding the other mine-workers, whom this nighthawk has endeavored to slander.

Butte.

MAGALIE NOTES.—*Oroville Mercury*, March 4: Henry Wylie, of Magalie, was in Oroville yesterday and paid the *Mercury* office a visit. He reports a revival in mining interests in that section. The Alki mine, under the management of Mr. Perry, is running pumps night and day reducing the water in the shaft. The old famous Coal claim is being extensively developed by a tunnel in about 400 feet. Chas. Bader is working in a gravel mine with good prospects. The Oro Fino is also being marked with excellent prospects. The Black Leg mine has been bonded to capitalists and early workings are promised. The Mineral Slide, S. P. Moody superintendent, has been started up again, and, it is reported, is turning out good pay. In fact, Mr. Wylie says mining prospects were never brighter on the ridge than at present.

Calaveras.

MINING ENTERPRISE.—*Calaveras Citizen*, March 4: A company is being formed in town to employ prospectors to explore a piece of mining ground near town. The expenses will be provided for by assessments not to be above a certain pro rata. In this way a good deal of prospecting can be done and the expense divided, as no one will be very heavily assessed. This is a good plan to prospect known mineral ground.

MURPHY NOTES.—*Calaveras Citizen*, March 4: T. R. Garnier, manager of the O. K. mines west of town, has let a contract to John Canyon and Frank Collier. The distance to be run is 100 feet at \$2.50 per foot. The O. K. mine is situated near the Beatrice, in the same mineral belt. The mine was formerly owned by J. S. Sublet. Flattering reports come in from the Stanislaus district. It is said that while J. S. Sublet, the veteran prospector, was recently cutting a new road to the Sublet mine, he unearthed a lode about six inches in width that prospects a thousand dollars a ton. The extent of the lode and its richness is at present unknown of course, as it is yet wholly undeveloped. S. O. Carley is still peering away at the Louise mine at Grapevine gulch. The rock remains of its old-time richness and permanence is manifested. It is rumored the work will soon be resumed upon the old Calaveras mine at Indian Creek. Who the parties are at the helm and what they contemplate doing is as yet not known. N. Berrow is taking out fair prospects at the Three Tree mine near town—a recent discovery.

WEST POINT.—The Blazing Star is still pumping. D. H. Lee & Co. have a good prospect near town. The Riverside is still idle, with very little prospect of starting. The Lone Star works about 50 men, and the 20-stamp mill is kept running night and day. The Scorpion mine is being opened by a San Francisco com-

pany, under the management of Mr. M. Denison of this place. Sinking has already commenced, and rumor has it that a rich ledge has been struck.

El Dorado.

MILL MOVED.—*Georgetown Gazette*, March 3: The mill, hoisting works and other machinery of the old Clipper mine have been hauled to Spanish Dry Diggings, to be set up, we understand, on the French Hill mine, owned by a Sacramento company.

Nevada.

A RICH STRIKE.—*Transcript*, Mar. 3: John Hussey of Yon Bet came to town yesterday and brought with him a magnificent specimen of gold-bearing quartz, which was taken from his tunnel on the north fork of Steep Hollow, a half-mile south of the Big Tunnel and about six miles from the town of Washington. The specimen is literally filled with chunks of the brightest, cleanest-looking virgin gold we have ever seen. A prettier specimen was never found anywhere. The gold sticks out in horns from the rock, and in one place there is a perfect fern leaf of gold nearly two inches long and five-sixteenths of an inch wide, the veins of the leaf showing as plainly as though outlined by an expert jeweler. It is estimated that the specimen contains over \$100 in gold, but as a specimen it is worth much more. Mr. Hussey says he thinks nearly \$100 worth of gold was broken off in getting this piece loose. The World's Fair Committee should purchase it and have it sent to Chicago for exhibition. Mr. Hussey and his son have for some time been running a tunnel in search of a deposit similar to that of the famous Spanish mine in Washington township, and the striking of the rich rock was a great surprise. The croppings of a quartz ledge may be traced some distance in the vicinity of their tunnel, and it was in a spur from this main ledge that the rich quartz was obtained. Two or three carloads of fine rock, nearly all of it showing free gold, were taken out, and then operations were temporarily suspended. We expect to hear of further developments before long, and hope the rich streak will continue on and into the main ledge, which is about 40 feet from where the strike was made.

TO WORK TAILINGS.—*Herald*, Mar. 3: C. F. Burns and F. D. Gould are the names of two San Francisco gentlemen who have come here with a new and simple process of working tailings from quartz mills, and their scheme is to put in their plant on Deer creek, near White's ranch, and work over the tailings from the Providence, Champion and Mountaineer mines. They will pay the mine-owners a stated price per stamp for the exclusive right to work the tailings from their mills, and have fair prospects of making something out of them. The Chinese have heretofore had a monopoly of such mining here, and they make it pay, even by the laborious process of cradle and rocker.

WORK GOING ON AT THE CHAMPION.—*Herald*, Mar. 3: The extensive surface improvements at the Champion mine are nearing completion, and, when finished, the Champion will have one of the finest plants in the county. The new hoisting works is a large building, about 34x100 feet in size, and has been built right over the old building without interfering with the work. It is some 30 feet higher than the old building, and the cars will be run out at a sufficient elevation to do away with the present hauling of rock at the ore-bins in the mill. It is a substantial building, and the gallow's frame in it is calculated to stand till the incline is down another thousand feet. A massive granite wall, four feet thick, is being built between the new works and the road, and it will be high and strong enough to protect the hoisting works from any caving of the steep bank, or any flood of water that is likely to come down and fill up the shaft. When it is finished, Superintendent Zeitler will feel that both his property and his miners are comparatively safe. The number of cars coming up from the incline is something astonishing. By a system of chutes in the incline, a car can be loaded in ten seconds by the watch, and they are hoisted and lowered without intermission. Seventy-five tons of ore are hoisted every day, besides the waste dirt. This keeps 30 stamps and 11 concentrators running. The mill is a model of excellence, and under the management of Superintendent Davis. When the new rock wall is completed, the road will be widened and a machine and repair shop built alongside the hoisting works. The company is now employing 120 men.

Mono.

COMBINATION TUNNEL.—*Bodie Miner*, March 4: D. E. Jones, superintendent of the Combination tunnel, Jordan, passed through town Wednesday en route to Ohio. His mission is ostensibly to attend to some family business, but it is said his trip will have an important bearing on mining operations at Jordan. Some of the owners of the Combination tunnel live in Ohio and it is surmised that Mr. Jones goes to consult with them relative to the resumption and prosecution of work at Jordan. It is known that a large body of rich ore is there, and should the hopes and anticipations of many practical mining men who are not accustomed to dwell upon improbabilities be realized, Mono county will leap to the front as the leading bullion-producing section of the country.

MONO.—During the past week east crosscut from main south drift, 550-foot level, was extended 15 feet. West crosscut from same drift was extended 18 feet. There were employed four miners and one carman.

BONIE CON.—During the past week east crosscut, 550-foot level, was extended six feet. Upraise, 400-foot level, was extended eight feet. Upraise, 300-foot level, was extended 11 feet. West crosscut, 200-foot level, Lent shaft, was extended 16 feet. There were employed six miners, one carman, and, jointly with Mono,

one engineer, one blacksmith, one watchman and one foreman.

San Diego.

JULIAN.—*Sentinel*, March 3: This camp, like many others, has had its ups and downs. For a year past it has been experiencing one of the downs—in fact, it has been clear down to hedrock in mining enterprise. In this case, hedrock means the Bailey Bros. of Banner and a few resident miners, who, in the 22 years past, have always remained at their posts, and, by their untiring energy, grit and faith encouraged others, and brought a revival in mining circles. The outlook for a revival of the proper kind is surely encouraging. Mining men are casting about for gold properties, and Julian will get her share of those who are real miners, not boomers; and when she gets them, the merit of this mineral belt will hold them. They are already beginning to arrive, and invest, and there are more on the way. We expect to see several good mines change hands and be put in operation before the summer is over.

Shasta.

LOWER SPRINGS MINES.—*Cor. Shasta Courier*, March 4: The Gipsy mine is being worked both day and night, a force of eight men, including the cook, being employed there. Mr. McTimmons informs me their shaft is down 50 feet, up to February 26th. The timbering or cribbing of the shaft is kept close up with the sinking in order to secure the shaft. The water is quite easily managed. The ledge is large and carries an abundance of sulphurets. The slime from the vein is supposed to be valuable, and preparations will soon be made for a thorough test. Connors' group of mines is pushed ahead as fast as possible. They are working three men by day only. Connors informed me his cross tunnel is in 130 feet, up to February 26th. No perceptible change is noticed in the breast of the tunnel. There is a group of ledges upon this property by which six pay shoots have been discovered since his management upon the place. Mr. Connors thinks it will take the larger portion of this year to demonstrate the merit of these deposits, but is sanguine of stirring up a little boom in that vicinity this summer. Deakin & Taylor's mines are under consideration I presume, as no word has been received as to the consummation of the bond, but it is evident that work upon the veins will soon be commenced if this company does start to work, as there is no reason to doubt it will be a step in the right place. Then the wheel of progress will start rolling all around this camp.

POCKET.—*Shasta Courier*, March 4: Wm. W. Engram struck a rich pocket at the Engram and Wright claim near Shasta, and from February 1st to February 27th he panned out \$1433 in gold. The claim is on Rock creek, a mile below the road crossing and about the same distance northeast of here. On February 23rd, Engram panned out three pens of dirt, and from one got \$219, from another \$90, and \$243 from the other, a total of \$552 from the three pens. One piece he took out weighed \$103, one \$137.50 and another \$30. A number of pockets have been taken out in that section, but Engram's best strike is the best that has been made for some time. About four men are employed at the Hidden Treasures on Iron mountain, below the Lost Confidence. They had some very rich ore on top, but nothing very favorable has been discovered in the lower tunnel, which is in the hill 140 feet, and looks "blue" so far as the prospect for good ore is concerned. Howkett and Anderson are employing four or five men on their mine, formerly the Vandever and Billard claim, on Flat creek, and keep their Huntington mill in motion. Isidore Krause, of this place, has sold his mine on Flat creek to Hans Christensen. The McMahon reduction works at South Fork, near Tgo, were to have started up this week, and it will not be long before E. Ballou will have his reduction works completed and in operation. Lorenz Garrecht and Frank Cunningham own and are working the New Years mine, a very promising location, situated near Hightown, about two miles northeast of Shasta. They are down about 30 feet, and the ledge at the bottom of the shaft is between three and four feet wide. The ore from the shaft and croppings assays very satisfactorily to the owners.

OLD DIOGONS.—The Texas and Georgia mines have been sold to an English syndicate for a big price. The mine is no doubt one of the best paying mines in the State. Mr. Hart has his 20-stamp mill running day and night, and has plenty of good ore in sight to keep the mill going for many months. Mr. Hart let a contract lately for another tunnel, 150 feet lower than the present works. This shows that Mr. Hart has faith in his mine. Mr. Cheyney, the banker of Philadelphia, made the final payment on the Mammoth mine last week to Garrecht, Panter and Yung. Mr. Morton, the able superintendent of this mine, has made several strikes the last month or two. He has followed the ore chute from the upper tunnel to the lower one, a depth of 175 feet. He runs a crosscut north and south, and it shows up fine in every place. The new company has not decided yet what it will do, but we should not be surprised to see another 30 or 40-stamp mill along the river before many months. The Walker Bros' mine is coming to the front also. Mr. Rippetto, the superintendent, has had a force of men working for nearly two years, running a deep tunnel. A few days ago he struck a well-defined vein. The tests Mr. Rippetto has made with the ore are very satisfactory, and he feels jubilant over it. The Reid Consolidated has resumed work again on its mines. The company had to stop work on its Spanish shaft, as it could not keep the water out of it. Mr. Stevenson, the manager of the mine, informs us that he will erect steam hoisting works in the near future. Frank Panter has stopped operations temporarily on his mine (Donkey). He has left for San Francisco on some mining

business, but will resume work again after his return. It is only a question of time when Old Diggings will be the liveliest mining camp in California. All the experts and mining men predict that Old Diggings will be a second Comstock.

Siskiyou.

A BETTER SYSTEM.—*Yreka Journal*, March 8: The American Bar Co., near Ash creek, Klamath river, consisting of Portland capitalists, are putting in extensive works on a new and better system than any river claims in this county now possess. The water-wheel will be 40 feet, occupying nearly the full width of the river, and is 18 feet in diameter, with an estimated capacity of 250-horse power, which will run all the machinery used, including two derricks, each capable of lifting seven tons, a centrifugal pump with a pressure of 250 feet for pumping out claim and filling sluices, besides other machinery. The gravel is raised by the elevator process from hedrock, the derricks being used only for raising boulders, lowering timber and such kind of work. The water-wheel is automatic, and will raise or lower with the stream, either a foot or six feet if necessary. The derrick masts have no gnyropes, being braced at the foot, and the boom, resting against the foot of the mast, is pulled up like a fish-pole, dropping the boulder where desired, just as a fisherman lands a fish.

SALMON RIVER.—The prospects for a prosperous season in the Salmon River section never looked better, affording great encouragement to miners. Several new fields of great value have lately been discovered, and the heavy quantity of snow on the mountains, with the ground thoroughly saturated from frequent storms, will furnish a good supply of water until late in the season, both for mill-power and gold-washing purposes.

Tuolumne.

AROUND BUCHANAN.—*Cor. Union Democrat*, March 4: The Garfield Virginia Mining Development Company are pushing their main tunnel head very rapidly, on a vein of gold milling ore. The operations of this company are under the immediate superintendency of Mr. A. C. Maier, and are viewed with favor by prominent mining men of this section, inasmuch as the main tunnel is going into one of the finest mineral belts of the State. It cannot help, by proper management and the expenditure of a small amount of capital but develop a first-class mining proposition. The Buchanan mill has been running steadily for the past month and we expect to hear of good results in the near future. Although your report of last week was not altogether correct, it is generally known here that some very good ore has been taken out.

SANTISIMO.—*Tuolumne Independent*, March 4: The Santisimo mine, on Jack's Hill, is being very vigorously worked at present by the new owners—Harriman, Oliver, Loftus, Gillis and Hawley—and in the near future we would not be surprised to learn that another bonanza had been discovered.

But two or three of the pocket mines in the neighborhood of Tuletown are able to be worked at present, on account of being filled up with water from the recent heavy rains. As soon as the surface water is drained off, active work will commence again and good strikes will then be in order.

MR. MEAN, who is mining the old Masonic building lot in Columbia, is rushing things lively and is seemingly prosperous, as pieces of coarse gold can be seen in the bank of gravel now being worked. We learn that the building will soon be taken down and removed to the Rewhide mine, the owners having purchased the bricks to erect chlorination works.

THE Bonanza's new machinery, which is operated by water-power, we believe, instead of steam, saves the company about \$3 per day on the expense account. They have been running on the dump or refuse for some time, and have been fortunate enough to make running expenses while getting things in order. They have begun on new ground, where it is expected that good results will follow.

NEVADA.

Washoe District.

CON. CAL & VA. MINE.—*Virginia Chronicle*, Mar. 4: 1500 level.—Have continued to extract ore and old fillings in working upward in the old south slopes, now on the 14th floor above the sill floor of this level. 1650 level.—Have continued making necessary repairs to the drifts on the sill floor of this level. We continue to extract some ore from the old stops, eight floors up in the upraise No. 6 carried up from the main northwest drift; also from the old stops in working north from the crosscut run west from the northwest drift. A north drift has been started and has been advanced 34 feet in a porphyry and quartz formation, which carries very low assay value. The winze started in this west crosscut, in old timbers, has been sunk 24 feet; total depth, 60 feet; in porphyry and quartz formation of very low assay value. Have extracted during the week from the 1500 level stopes and 1650 northwest drift openings and raised to the surface 561 cars of ore, about 550 tons. Shipped to Morgan mill 323 550-2000 tons of ore. Average assay value, per railroad car samples, \$23.52. The average assay value, per battery samples, of all ore worked at the mill during the week (970 tons) was \$26.06 per ton. Bullion shipped to Carson Mint, assay value \$27,446.50.

OPHIR.—1465 level.—Have completed the work of cutting out a chamber in the north lateral drift on the sill floor of this level, at the point where connection was made with this drift by the upraise which was carried up from a point 99 feet below on the north side of the crosscut run east from the drift run south from the Mexican into the Ophir ground. We are now placing hoisting machinery in this chamber,

and this work will be completed in the coming week.

MEXICAN.—On the 1465 level the drift run north from the crosscut run east from the bottom of the winze sunk 101 feet below the sill floor of this level, near the south line of the mine, has been advanced 6 feet; total length, 576 feet, continuing in a hard porphyry formation. From this north drift, at a point 510 feet in from its mouth, a west crosscut (No. 2) was started and has been advanced 17 feet in a porphyry formation showing clay separations.

URAN.—340 level.—The south drift from the main west drift at a point 595 feet in from the shaft has been extended 21 feet; total length, 143 feet; continuing in porphyry, clay and quartz formation.

SIERRA NEVADA.—Are making necessary repairs to intermediate tunnel. The joint Sierra Nevada and Union west drift, 900 level, has been advanced during the week 22 feet, making the total distance west of the joint shaft 2976 feet; the face is in porphyry.

UNION SHAFT.—The joint Sierra Nevada and Union west drift, 900 level, has been advanced during the week 22 feet, making the total distance west of the shaft 2976 feet; the face is in porphyry.

ANNAS.—On 420 level north drift from cast crosscut No. 1 north advanced 16 feet; total length, 131 feet. This drift is all in quartz.

BEST & BELCHER.—200 level.—West crosscut No. 1, started in northwest drift, 170 feet from our south line, has been extended 20 feet, passing through quartz giving low assays; total length 96 feet. 900 level.—West crosscut No. 3, from top of upraise No. 1, from 1000 level, has been extended 15 feet; total length 158 feet; face in porphyry, clay and stringers of quartz. Suro tunnel level.—The joint east crosscut with Gonid & Curry Company has been advanced 12 feet during the past week, passing through porphyry; total length, 42 feet.

GOON & CUAAY.—200 level.—During the past week, west crosscut No. 5 started in northwest drift, 432 feet from main west drift, has been advanced 20 feet; total length, 347 feet; face in porphyry. Suro tunnel level.—The joint east crosscut with Best & Belcher Company has been extended 12 feet; total length 42 feet; face in porphyry.

HALA & NOCAOOS.—We are putting in new guides in the south hoisting compartment of the main shaft. Main Incline.—We continue making the necessary repairs. 1400 level.—Are retimbering the main north drift on this level. 1800 level.—West crosscut No. 1 from the main south drift was advanced 19 feet; total length, 165 feet; face in porphyry. West crosscut No. 3 from main north drift was extended 10 feet; total length 382 feet. The face of this crosscut has reached the west wall. From the end of this (No. 3) west crosscut a north prospecting drift was started during the week and advanced 5 feet. The face of this drift is in quartz and porphyry. West crosscut No. 4 from main north drift was advanced 20 feet; total length 212 feet; face in porphyry.

MOULAA.—The north drift from the south line, 550 level, is out 234 feet; face is in quartz containing bunches of ore. We are repairing west drift, 450 level, and south drift, 750 level and retimbering the two north compartments of the main shaft above 930 level. Have started a crosscut east 260 feet south of north line, 930 level; face is in porphyry.

BULLION.—The west crosscut from the north-west drift, 300 feet south of north line, 1800 level of Ward shaft, is out 333 feet; face is in porphyry.

POTOSI.—The west crosscut from face of south drift, 30 feet back from face of east crosscut from the Potosi winze, 930 level, is out 16 feet; face is in clay and porphyry and some low-grade quartz. The north drift, 30 feet back from face of east crosscut opposite the Potosi winze, 930 level, is out 10 feet; face is in porphyry and streaks of quartz. The south drift from top of raise, 1000 level, is out 214 feet; face is in quartz and porphyry. The north drift from top of raise, 1000 level, is out 155 feet; following a streak of ore 16 inches wide, which assays from \$25 to \$30. The north lateral drift from the bottom of the Potosi winze, 1800 level Ward shaft, is out 95 feet; face is in quartz of low assay value. Extracted and sent to mill the past week 459 tons and 750 pounds of ore from the 550, 950 and 1150 levels. Milled during the week 400 tons; on hand at mill, 139 tons and 1750 pounds. Average battery assays, \$26.14. Average car sample assays, \$26.15. Shipped to U. S. Mint, Carson, 347 pounds of crude bullion.

APEX.—Last week we advanced the drift crosscut 15 feet and began sinking winze No. 1, which shows indications of a body of ore.

WAAN SHAFT.—The west crosscut from the northwest drift, 300 feet south of the Bullion north line, 1800 level, is out 333 feet; face is in porphyry. The north lateral drift from the bottom of the Potosi winze, 1800 level, is out 95 feet; face is in quartz of low assay value.

EXCHAQUAA.—No work has been done on the 1800 level of the Ward shaft during the past week.

ALPHA.—No work has been done on the 1800 level of the Ward shaft during the past week.

NEW YORK.—During the week we have been grading the winze below the 650 level. The west crosscut, from the southwest drift, 850 level, is out 74 feet; is in low-grade quartz and porphyry.

SILVER HILL.—The southeast drift, 450 level, has been advanced 5 feet, through hard porphyry; total distance from north line, 62 feet.

Central District.

IMPORTANT MINING SALA.—Silver State, March 1: An important mining deal was concluded here yesterday by the sale of the Blackbird mine in Central district to Detroit parties. The

consideration is reported to be \$18,000. The mine was formerly called the Aurum and was owned by Clark & Standing. It is one of the best-developed and richest gold mines in the county. The purchasers will at once commence active operations, and a mining boom in Central may be looked for in a short time.

Kennedy District.

ACTIVE OPERATIONS.—Cor. Silver State, March 1: All the mines are looking well in the district, and the boys are pushing their work as fast as possible. The Imperial mine, owned by Kennedy & Co., which is the most developed of any mine in the camp, is looking well. The main tunnel is in 250 feet and shows a strong ledge of good ore all the way. There is an incline down 50 feet from the bottom of this tunnel, showing a well-formed ledge of good size and good ore. The face of this tunnel is about 100 feet from the surface. Tunnel No. 2 is in 80 feet, which is 100 feet lower than No. 1 and shows a big ledge of good ore. They shipped two carloads that worked over \$800 to the car. They expect to have a shipment by the first or middle of March, from which they expect to realize as much or more than they did from their previous shipment. Lawler & Co.'s mine is looking well. They have a vein of ore from 8 to 12 inches thick that prospects well. Ed. Stone expects to have a carload from the Alice as soon as the roads are passable. Mark Wiggins is at work on the Kearsage, from which he is taking good rock. W. G. Wilkinson is running a crosscut to strike the ledges on his Union mine. He has encountered some very hard rock on the way. In running 75 feet he has cut several stringers that assay very well. He has about 50 feet farther to run to strike the main ledge. Wm. Barrett has struck some fine-looking sulphurets in the Crown Point. There are several other prospects in the camp that are looking well, and all they need is work to bring them to the front. All the camp wants is reduction works to make it one of the best in the State. We have a weekly mail, which is a great addition to the welfare of the camp. We have had a very pleasant winter, the mercury seldom reaching zero.

ARIZONA.

GOLD STRIKE.—Prescott Courier, March 3: A rich gold strike is reported on the east side of the Agua Fria, near the Boggs. The ledge has been traced a long distance by rich free-gold chimneys which crop out on the surface. The ledge is from 50 to 60 feet wide, has been run in on only nine feet and blocks of ore as large as an ordinary stove have been taken out literally covered with free gold, many of the pieces of gold being as large as an ordinary pea. The gold is bright, clean, yellow and very pretty. Two men, working 150 feet apart, are taking out this character of ore.

GOLD MINAS.—Prescott Courier, March 3: While some people hereabouts are, with good reason, bemoaning the sad fate of silver, as a matter of fact the unsatisfactory condition of the silver market has had more to do with bringing this section into notice than any other cause; for here lies the most extensive gold-mining belt known, and to its exploration and development have not only our local miners turned their attention, but mining capital driven out of silver sections to the north and east of us is finding its way here and going into gold properties. Now that the current of prospecting and capital has turned into this channel, not a week goes by without the finding of new gold properties in this mineral belt, all of them good—some of them veritable bonanzas. Every dollar driven from silver investments can be put into our great undeveloped gold belt, and that very class of capital is pouring in here at present and its volume will steadily increase. It is bringing to us true mining men, men from the mining States and territories to the north of us, men who have both the means and experience and conduct mining on purely business principles; who know mines when they see them, and who have pronounced this the greatest gold country known. The hazardous investment of money in mines by men who don't know a piece of quartz from a grindstone, is, as a rule, only a temporary benefit to any mining section, for these enterprises, with few exceptions, become stranded from sheer ignorance of the business, and the section gets a black eye. Such investors have done Arizona far more harm than good.

MONTANA.

AMONG THE LEDGES.—Butte Miner, March 2: As to the Anaconda properties, March 5th has been set as the time for a resumption of operations thereat, and no doubt the present intentions of the company to start on that date will be carried out. When the mines first closed down it was rumored that they would be started up again in a few days, but it was the intention, it is said, to remain closed until April 1st. However, matters have so shaped themselves that the expiration of the three months combine shut down will enable the company to again start up on the same old colossal scale and continue until the "fine dust" again clogs the wheels of operation. To start in, the shipments of ore will not be large, but they will increase gradually until the smelters are consuming their usual quantity. During the suspension, all the mines were placed in first-class condition, the shafts of several being deepened and retimbered. It is expected that within two weeks from next Sunday, which will be the day the button is to be pressed, fully 1000 men will be working in and about the company's properties. Besides these, the Montana Union road will give employment to many more. The news of the resumption was sent out by the company yesterday; yet, notwithstanding the fact that it was soon generally known, no great excitement resulted. This is no doubt due to the fact that, during the last few days, many men have been put to work at the syndicate properties, which was in itself pretty good

proof that a resumption was not far distant. Some of the old men have left the city since the suspension, but they will return when the news of starting up reaches them.

LEONARD SHAFT IMPROVEMENT.—A new stack is being erected to carry away the smoke from the furnace of two new steel boilers recently placed in position at the Leonard shaft of the Boston & Montana Co.'s Colusa properties. The stack will be 125 feet in height. The boilers are to have a pressure of 130 pounds, and are intended to hold steam for the large pumping engine which will shortly be placed at the 600-foot level of the Leonard shaft. A portion of the pumping machinery was shipped from Chicago on the 16th ult., and was due at the mine Saturday. The portions of the pumping machinery with which the water will come in contact are made of bronze and copper, which will preclude the possibility of further trouble from the corrosive water. The column pipes will also be copper. After the machinery is in position, the shaft will be deepened 400 feet.

THE RAMSDALL-PARROT.—The Ramsdall-Parrot mine is being worked in a small way by the owner. The ore is shipped to Denver for treatment. Although the workings are 500 or 600 feet in depth, the ore now being taken out comes from the 300, at which point the vein is quite large. It is said that F. August Heinze, the gentleman who owns a smelter at Meaderville, lately offered Mr. Ramsdall \$1000 per month for the privileges of working the property, but Mr. Heinze had a year's lease on the mine before he took the Estrella—a fact which led Mr. Ramsdall to decline the present proposition. In the lower workings of the Ramsdall the ore bodies are very large and rich, the ore from the rich streak, with one of which all the large copper veins of the district are supplied, containing much native silver. The Shakespear-Parrot and Bologna, both of which are located east of the Ramsdall, also belong to Mr. Ramsdall.

NEW MEXICO.

PIÑOS ALTOS.—Southwest Sentinel, March 3: New ore bins have just been put up at the Langston mine in the Piños Altos district, and Miller & Watson are shipping ore from the mine to the Bremen mill here, where it is being treated. There are no idle men at Piños Altos now, and the prospects of that camp are better than they have ever been before. The mills here and at Piños Altos are crushing about 150 tons of ore a day and this will be increased to 200 tons as soon as the Manhattan Company gets to taking out ore. No other camp in New Mexico can boast of mining operations carried on in such an extensive way. Prof. Waring says that the contact in Chloride Flat is precisely the same as that at the Mollie Gibson mine in Colorado. Perhaps a bonanza may yet be discovered almost within the city limits of Silver City. About 30 tons of ore are being shipped daily from Hanover. There is very little demand for iron now on account of the fact that none of the smelters in the Southwest are running to their full capacity. A carload of zinc ore was shipped from Hanover yesterday, and some other small shipments will be made soon. J. H. Broughaw is contemplating extensive operations there in the zinc mines in the near future, but the Mineral Point Zinc Company, which owns a number of claims in the district, will do no work of importance in its mines this year. A feasible route has been found from Hanover to the alum beds on the Gila river, and if a good route can be found from the Gila to the coal-fields it will not be long until the construction of a railroad from Hanover to the coal-fields will be commenced. Cheap coal for reducing the Hanover ores will mean a great deal to the miners of that district. The criminal cases against Robert Milliken, of the American Silver and Lead Company, have been dropped for the present. The company's property at Cook's peak has been closed down for the present, and work may not be resumed until late in the season. A large amount of money was due the miners at the time the company suspended operations.

OREGON.

PLACERS.—Jacksonville Times, March 3: Placer miners will do well this season, having a good supply of water. T. H. B. Taylor and sons of Pleasant creek are having a big run, with lots of water, and will doubtless make a nice cleanup in the spring. S. C. Lawrence has located an extension to the ledge discovered by D. Horn in Gall's creek district, which promises fully as well as the original discovery. John J. Neatbammer is utilizing the fine head of water he has at his mine on Saxe's creek, in the vicinity of Woodville, and expects to make a good showing when he cleans up. D. Horn, who found so rich a ledge in Gall's creek district recently, has sold it to a company composed of O. Ganiard, H. L. White and others. Four thousand dollars was the price paid, Horn retaining a number of sacks of rich ore he had already taken out. The new proprietors doubtless have a bonanza, and will work it to the fullest extent.

SOUTH DAKOTA.

D. & D. SMELTER.—Deadwood Pioneer, March 4: The D. & D. smelter, which has been closed down since Saturday night on account of the coke running out, is reducing the usual amount of ore again. The coke was not shipped through on regular time or there would have been no necessity of closing down. Dr. Carpenter stated to-day that the three extra stacks would be finished at an early date and would be blown in as soon as possible. As the amount now paid by the company for coke reaches \$100,000 per year, it can be readily seen that with all four stacks running the coke bill will be something enormous from now on.

RAPOATAN RICH STRIKE.—The recent discovery that Chicago park, a mile above the town of Pitkin, Colorado, is underlain for miles with mineral of high grade in workable distance of

the surface has caused an old-time mining boom. Shafts are being sunk all over the park. Some of the mineral runs as high as \$18,000 to the ton, and will average \$190. The character of the discovery is such that the Union Pacific railroad will immediately reopen the old Alpine tunnel. It has been closed several years and the Rio Grande Company will construct a branch from Parline to Pitkin for the purpose of securing the business in view. Cudaby, the Chicago pork man, is interested largely in the company.

GREENBACK WATER-RIGHT.—George Brettell, president and superintendent of the Greenback Mining and Milling Company, was in the city yesterday, and he stated that extensive development work would soon be commenced on the Spearfish water-right belonging to his company. The water is to be flumed so as to give three heavy falls within six miles from where it is first taken from the creek channel, and at each fall a plant will be put in for the purpose of generating electricity. Mr. Brettell will leave for the East in a few days to purchase machinery to be used at the first fall, and the company will erect another plant or two as soon as the power can be disposed of at a reasonable figure. It is the intention of the company to use a part of its power to run a stamp mill, which it will erect somewhere in this vicinity, for the milling of ore which will be taken from the Greenback mine at Lead.

HARDING-BAKER PROPERTY.—It is now given out that the Harding-Baker Company will resume development work on its mining claims at Two Bit within the next six weeks. There is already an 85-foot shaft on the property and it is stated that it will be sunk to the next contact. Besides this, a first-class drill has been ordered and it will be kept busy on the different claims during the entire summer. It is known that vertical veins of galena and carbonate rock exist in that region and that the ore is usually high grade. If the company should strike some of these veins, it would not only result in making the owners wealthy, but it would mean the extensive development of all property in that vicinity.

The Bucyrus Steam Shovel and Dredge Company.

The new works of the Bucyrus Steam Shovel and Dredge Company at South Milwaukee, Wis., are about ready for occupancy and expect to start up in about a week. This plant will be the finest in the country of its kind, and for its size, will be the best to be found anywhere.

Owing to the large business done by the Company, the works at Bucyrus have been decidedly cramped for some time. The change to be made will give ample accommodation. The new location is in every way a most advantageous one for the conduction of a business such as that in which the Bucyrus Steam Shovel and Dredge Company is engaged, and there will be plenty of room to increase the capacity of the works when this again becomes desirable.

Regarding business done during the past year, the Company writes:

"We have never been so full of work as at the present time; we have over \$200,000 worth of unfilled orders on our books, and more coming in constantly."

The patent improved placer mining outfits, which the Bucyrus Steam Shovel and Dredge Company has been introducing during the past three years, have proved very successful. It has a number of these plants in successful operation, and is making several others on orders. The Fortunas Mining and Milling Company, of Albany, has just ordered a second plant, after testing to its satisfaction the one which it bought last year.

THE PRESS is in receipt of Volume X of the *Advertiser Reporter* issued by the Publishers' Commercial Union, whose main office is at Chicago. The *Advertiser Reporter* is a work invaluable to newspapers and other publications. Its purpose is to give a complete and accurate directory of all the general advertisers in the United States, with the financial rating and worth of each. In other words, the design is to assist publishers in learning as to the reliability and credit of all persons, outside their local surroundings and with whom they may be unacquainted, desiring to advertise in their columns. It will at once be seen that a work of wide scope and great delicacy is thus undertaken. The Publishers' Union appears to have discharged its task with special credit and conscientiousness. Previous volumes have been compiled with care, as many publishers can attest, and Volume X is even above the usual high standard.

The Robinson Riffle.

In a recent number of the MINING AND SCIENTIFIC PRESS (Feb. 24), was published a description of the Robinson riffle as used in the cyanide process plant in Shasta county. Mr. George K. Fischer, M. E., of Denver, Colo., seeing the article, sends us some drawings which we here reproduce, and describes certain improvements in the riffle, as follows:

"The MacArthur - Forest Company in Denver has experimented with the Robinson riffle and other forms for the purpose of reclaiming the coarser gold from the pulp after passing through the cyanide process. It may be of interest to briefly describe the result of their efforts and the form of box finally adopted. The mill was running upon gold ore from Dakota consisting of sulphide, graphite, and manganese, with 85 per cent silica. The extraction by the cyanide process was 85 per cent of the assay value of the gold. The panning of the tailings showed 10 to 12 colors per pan, the gold grains being perfectly clear and bright by the action of the cyanide. The Robinson riffle constructed as described in your article was then introduced below the sluice. In a short time the pulp commenced to accumulate at the foot of each riffle (Fig. 1—B), and before long the mercury, shown by letter A, was covered with a deposit of sulphides, etc., which rendered it entirely useless. Various grades or inclines for the box were tried, with no better success. The banking was due to the heavy sulphurets, a large proportion of coarse clean-up from the battery and the irregular flow of water and pulp. The velocity of the water necessary to carry the pulp down was such that the stream in dropping from one riffle to another overflowed, as shown in Fig. 1, though perhaps this result was somewhat magnified by the fact that the riffles were not as long as described in your article.

"A new form of riffle (Fig. 2) was then introduced (with the inclinations as shown in the sketch), with the following results: The water and pulp shot down the inclined 'C' with considerable force, throwing the heavy particles onto the mercury. The only accumulation then took place at B, while the mercury remained clear and bright. During the run the tailings were constantly panned at the end of the sluice and showed no color. The box consisted of 23

riffles, 12 inches wide and 12 inches long, and nearly all the gold was caught in the first half of the box."

ONE of the most important mining deals in the history

Electric Tramways in the Country Districts.

Attention is gradually being directed toward electric tramways in country districts, not only for conveyance of passengers, but for produce, freight, etc. As feeders to steam roads already established, they would be very useful indeed. At several places they have already been established. These roads cost much less to build, equip and maintain than steam railroads, and in many places water power can be used for generating the electricity. In addition to its service as a line of transportation, a line of this sort may furnish to farms along its line whatever power is necessary for stationary machines. Our illustration (for which we are indebted to the *Electrical World*) shows an electric road in a country district utilized for the transportation of lumber from the sawmill in the vicinity. In this case, electricity also furnishes the power for the operation of the sawmill, a work which, of course, is not unusual for the electric motor. A number of instances where electricity is used for the operation of sawmills have been described and illustrated in our columns, the most striking of which was probably that in use on

the World's Fair grounds at Chicago, where no less than 11 different sawmill plants were in use, driven from current supplied from a single central station. In Oregon and Washington several electric roads have been built into timbered regions, and are used not only for hauling lumber, but for passengers and freight.

THE Alaska Treadwell mine mined and worked 120,000 tons of ore at a total cost of \$1.32 per ton. The mining was 65 cents; milling and concentration 33 cents, and chlorination of 2703 tons of sulphurets 19 cents per ton, or \$8.42 per ton of sulphurets. General mine expenses were eight cents and expenses in San Francisco two cents per ton. Bullion freight and insurance amounted to five cents per ton.

THERE is said to be 25 feet of snow on the Henry Mountains, Utah, and prospectors can do nothing there for some time.

AMERICAN CAPITALISTS from Kansas City are buying asphaltum deposits in the State of Tamaulipas, Mexico. Valuable mineral and oil deposits have been found in Southern Mexico. Some of the higher grades make an excellent lubricant.

Comment.

Certain Sacramento officials and other valley anti-debris men, who opposed the passage of Senator Ford's bill defining hydraulic mining, and permitting it to be carried on in California where doing no material damage to navigable streams or adjacent lands, have asked a hearing before the Governor, in order to induce him to veto the bill which passed both Houses. This the Governor has granted, but he at the same time gives representatives of the mining industry an opportunity to be heard in advocacy of the bill. This bill was very fully discussed and considered by both the committees and bodies of Senate and Assembly, and passed with very large majorities. It only proposes to permit hydraulic mining where no material injury is done, which is now permitted under recent court decisions, and the Caminetti law just passed by Congress. The object of Senator Ford's bill is to put on the code only what the law now permits. It is right in line with U. S. Court decisions and an Act of Congress. But the anti-debris people persist in carrying on their old fight to the last breath, notwithstanding the courts, Congress and public opinion are against them. They fear this will give the miner some right he does not now possess, or some right over which they can have no control. It is a simple act of justice to the mining community for the Governor to sign this bill, which gives the miner no new rights, but puts on legal record those already accorded to him. There never was any law or Act of Congress prohibiting hydraulic mining, but the court decisions were to the effect that it could not be carried on where inflicting injury to streams or lands. This is the case to-day, and only those mines are permitted to run which have shown they are able to impound the debris. Senator Ford's bill amends the code, by adding a paragraph that such mines as can run without material damage to streams or lands shall be permitted to do so. It gives no permission to break the laws, and conveys no new privileges. This being the case it should become the law, and the anti-debris people should have refrained from continuing their factious opposition.

Sacramento obtained its prestige and standing by being the distributing point of supplies for the rich mining regions of this State in the early days. Every one went to the mines in those times, and to get to the mines they had to go to Sacramento. The southern counties had no population to speak of, aside from the Mexicans, though the northern counties were filled with bustling Americans seeking for gold. So Sacramento naturally became the capital of the State, as San Francisco was the natural metropolis. The city on the river was made by the mines and the miners, and its original wealth came from those

sources. Yet for 10 or 15 years that city has been the center of opposition to mines and mining in California, notwithstanding much of the supplies are still purchased there. The citizens have contributed largely to suppress hydraulic mining, the supervisors have organized against it, and its newspapers never have a friendly word for the mining industry, but, on the contrary, attack it on every occasion. The city has forgotten all former obligations to the mining industry, and has been aggressively against it. Sacramento is now, however, put on the defensive to save itself. The Legislature has decided to submit to the people the question of moving the capitol to San Jose. In the discussion of the subject, a strong feeling of antipathy to Sacramento has become manifest. Some of the assaults are doubtless unmerited, and statements untrue, but it is nevertheless apparent that there is a general feeling of unfriendliness to Sacramento. The main objections to moving the capitol are based on the cost rather than to a desire to see Sacramento favored. That city has been selfish in that it has constantly looked to itself rather than the general benefit of the State. It has fought the miners at every step. Even when popular opinion and the laws are favorable to the rehabilitation of the mining industry, when it can be done without injury to streams or lands, the Sacramento men continue to oppose it. They oppose it blindly and on general principles. The miners do not ask to be permitted to cause further injury, but they do ask that they may be allowed to get out their gold if they can show it can be done without injury to other interests. Sacramento does not even want them to try the experiment. It cannot expect any friendly feeling from the northern mining counties. It cannot expect support from them. When the question of removal of the capitol comes to be voted on, Sacramento will regret the extreme course it has pursued with relation to the mining interests. It has been unreasonable in enforcing its demands, looking at but one side of the question, and has made more enemies than friends.

We used to value the stored snow in the Sierra every winter with relation to mining operations during the summer months. The gradual melting of the snow keeps the streams fed in summer, and as the quantity of water available bears a relation to the output of gold, the question of more or less snowfall is an important one in California. In these days the snowfall is more considered in connection with agricultural operations. Irrigation has become so universal in the valleys that a good supply of water is essential to bountiful crops. The snows of the Sierra constitute the principal source of irrigation supply. There is now an abundant quantity on the mountains, and unless warm weather comes on suddenly it will last far into the summer. This is good for the miners, too, though not so important as when all our hydraulic mines were working. Good water seasons increase the gold output in all surface mining. With quartz mines the mills run by water-power keep all their stamps dropping and do not have to partly "hang up." The miners expect a good water season this year. Most of the hydraulic mines will not be able to take advantage of it since they have not built the necessary dams, but by next season many will doubtless be built.

The bill to appoint a State Debris Commission passed both houses of the Legislature on the last day of the session. It is not probable that any appointment will be made for some months, but already there are several applicants for the position. In this case a skilled mining engineer is required, and it is to be hoped that only a first-class man will be selected. He will have to consult with the U. S. Commissioners, and no one but an engineer of undoubted professional standing and experience should be chosen. "Political engineers" have no business in such positions, and unless the applicant can get the endorsement of the best men in the profession he should not be considered.

It has been decided to put up the new copper-smelting plant at Salt Lake. That city has given a bonus of \$100,000 and 160 acres of land, and \$600,000 will be invested in a smelter, wire works and electrochemical plant. The latter building will be of stone and of brick, and 1,000,000 feet of lumber will be used in its construction. An engine of 1000 horse-power will be used to run the machinery, which will be of the latest pattern, and the works, when completed, will rival the well-known Anaconda smelter. The copper mines in the southern part of Utah, will doubtless be opened up and developed when this plant is ready for operation. This is a very important thing for Salt Lake as it will bring ores to that place from a wide region.

Two more parties of prospectors have come back from the desert without finding the Peg Leg gold mine, for which so many have hunted. These men are of the opinion that no mineral exists in that portion of the desert east of the Carriso or San Jacinto mountains. This opin-

ion, however, will not deter other parties from going over the same ground. Lost mine romances are very attractive, and a certain class of prospectors seem to prefer hunting for legendary mines, instead of putting in time trying to discover new leads.

It will be remembered that last July there was a heavy explosion of 400,000 pounds of dynamite and 17,500 pounds of black powder at the Giant Powder Works across the bay at West Berkeley. As scores of plate-glass windows in this city were broken, the New York Plate Glass Co. sued the powder company for damages, a test case being set. These windows which were broken were 13 miles from the seat of the explosion. The powder company claimed that it was a pure accident, and there was no contributory negligence. Justice Barry in his decision says the company, while admitting the accident, contends that the words vicinity and proximity are not established by this case. As to the word proximity, the court held that distance was controlled by other elements, as, for instance, the amount of powder stored up. A large mass of explosive matter works damage at a greater distance and so reduces that distance for legal purposes. It had been contended for the defendants that if the powder works had been a nuisance they might have been enjoined, but the court held that this was a suit to recover for damages already sustained, and not to restrain impending damage. The fact that the destruction had been wrought demonstrated of itself that the nuisance existed, and it was not necessary to show that the explosion was attributable to the negligence of anybody.

The New Mining Bureau Law.

On the day before the Legislature adjourned it passed the bill for the government of the State Mining Bureau, and repealed all former acts concerning this institution. The new law provides for five unsalaried Trustees, who hold office for four years. They control all properties and funds of the Bureau and adopt rules and regulations for its government. The State Mineralogist must consult the Trustees on all matters pertaining to his official duties and he must perform them subject to the supervision and approval of the Trustees. The Mineralogist is given the right to appoint competent assistants and qualified specialists when necessary in the execution of his plans, and fix their compensation, but all such appointments and compensations are subject to the approval and confirmation of the Trustees, and shall not be effective unless so confirmed and approved.

The State Mineralogist must have "a practical and scientific knowledge of mining and mineralogy." He is appointed by the Governor for a term of four years, at a salary of \$250 per month, and his necessary traveling expenses when on official business. These expenses, however, must be first approved by the Trustees, and then audited by the State Board of Examiners. The duties of the State Mineralogist are thus expressed in the law:

It shall be the duty of said State Mineralogist to make, facilitate and encourage special studies of the mineral resources and mineral industries of the State. It shall be his duty: To collect statistics concerning the occurrence of the economically important minerals and the methods pursued in making their valuable constituents available for commercial use; to make a collection of typical geological and mineralogical specimens, especially those of economic or commercial importance, such collection constituting the museum of the State Mining Bureau; to provide a library of books, reports, drawings, bearing upon the mineral industries, the sciences of mineralogy and geology, and the arts of mining and metallurgy, such library constituting the Library of the State Mining Bureau; to make a collection of models, drawings and descriptions of the mechanical appliances used in mining and metallurgical processes; to preserve and so maintain such collections and library as to make them available for reference and examination, and open to public inspection at reasonable hours; to maintain, in effect, a bureau of information concerning the mineral industries of this State, to consist of such collections and library, and to arrange, classify, catalogue and index the data therein contained, in a manner to make the information available to those desiring it, and to provide a custodian specially qualified to promote this purpose; to make a biennial report to the Board of Trustees of the Mining Bureau, setting forth the important results of his work, and to issue from time to time such bulletins as he may deem advisable, concerning the statistics and technology of the mineral industries of this State.

The duties of this official, as stated in the new law, are more carefully defined than formerly, and he is given permission to issue bulletins when advisable. The whole bureau, too, is made in effect a "Bureau of Information," such as was recently suggested in these columns, and the information now in the possession of the institution is to be so arranged and indexed as to be readily available to the public. The trouble has been in the past, to find ready at hand, what has been sought for on inquiry; or it has been necessary to find some certain individual who was in possession of the facts. Under this law, the collections, library, reports, etc., must be classified and catalogued, so that anyone may readily find what they want.

If the new Mineralogist, Mr. Crawford, systematically

carries out these instructions of the law, as he doubtless will, the State Mining Bureau will become a much more useful institution. The miners will give it more favor and give it more to do. They will be sure to keep it in mind when in need of information, and will also keep it in mind when it needs assistance at the hands of the Legislature. When they find it is being carried on for their benefit, and that each has a right to call upon it for information, they will use it more freely than in the past.

We are not informed what changes, if any, Mr. Crawford will make in the conduct of the Bureau; but the provisions of the new law will necessitate some departure from former methods, which will undoubtedly be to advantage of both the Bureau itself and the mining community. The institution has just passed a very critical period of its history, since it came near being abolished entirely by the Legislature, and bills were introduced to that end. Its friends, however, came to its assistance and it starts on renewed life with an appropriation of \$50,000 and a new man in charge. The Governor of the State showed a strong personal interest in the institution and was anxious to see it placed on a better footing so as to become more useful. We are of the opinion that it will be so conducted in the future that there will be no doubt as to its utility, and it will not be necessary to "lobby" for its support. Mr. Crawford the new State Mineralogist, who is from one of the old mining counties—El Dorado—is a Freiburg graduate, an intelligent and capable man, and one who is anxious to make the Bureau over which he presides, of the utmost practical use to the mining community.

A New Ore-Crushing and Grinding Pan.

Jas. H. Kinkead, the well-known mining superintendent of Virginia City, Nevada, has patented through the MINING AND SCIENTIFIC PRESS Patent Agency an improvement in pans for grinding ore. The pan is made of iron and of any suitable diameter, having an essentially flat bottom and vertical sides united by a curve of a quarter of a circle. The interior of this pan is lined with dies properly secured and forming a removable surface upon which the grinding takes place. Through the center of the pan passes a shaft, which is geared to it, and the lower end fits into a socket step. The upper end of this shaft has a ball formed upon it, and this fits into a corresponding shaft socket or box upon the outer end of a crank. More or less throw can be given to this crank as desired. The crank is fixed to a vertical shaft journaled in a box upon the frame timbers. A beveled gear-wheel is fixed to this shaft, and a beveled pinion is fixed to the horizontal shaft journaled upon the frame timbers and having driving pulleys upon the outer end through which power is applied to rotate the shaft and crank and move the pan.

In order to prevent the pan itself from turning round, there is fixed upon the lower end a hub having teeth formed in its lower surface extending radially from the center toward the outside. A corresponding set of teeth is formed on the upper, outer surface of the step in which the lower end of the pan shaft is supported. The two serrated faces are curved to have a radius corresponding with the amount of throw that the crank gives the pan, so that the teeth in the two surfaces will travel in contact, and, while the pan is caused to revolve around the central step by the movement of the crank with which the upper end of the shaft is connected, it is prevented from rotating about its own center by means of these teeth.

Within the pan are placed balls of such size that their curvature corresponds with the inner curvature of the die which is fitted into the grooved angle of the pan. When the machine is set in operation, the pan, revolving round its step constantly, inclines so that each portion of the periphery of the pan becomes temporarily the lowest, and, at the opposite side of the rotation, the highest. This peculiar movement of the pan causes the ball or balls to roll round continuously in the interior, and, if the speed is considerable, a centrifugal motion is developed which greatly assists in the grinding action of the balls. By reason of the peculiar motion of the pan, the balls are continuously rolling down hill, and the least possible power is needed to keep the machine in operation. Around the upper periphery of the pan is fixed a screen, so that all the material, as fast as it is pulverized fine enough, will pass out through this screen and fall into the surrounding circular sluice or trough, which is arranged to catch the pulp as fast as it passes out through the screen. By this construction Mr. Kinkead believes he has a very effective and continuous grinding pan, into which the ore may be delivered regularly, and as regularly discharged through the screen when fine enough.

THE leaching plant put up at Silver Peak, Esmeralda county, Nev., by John Ohiatovich & Co., for the treatment of gold tailings by the cyanide process, is now in successful operation.

Geographical Society of the Pacific.

Volume III of the Transactions of the Geographical Society of the Pacific has been issued. In addition to the lists of officers and members it contains the following papers: "Some Facts about Weather and Storm Phenomena," by Lieut. J. P. Finley, U. S. A.; "The Discovery of San Diego Bay," by George Davidson; "Recent Visual and Photographic Astronomy," by Prof. E. E. Barnard; "The Eruption of the Volcano Weniainioof," by George Davidson; and "Cable Surveys," by Lieut. Commander Z. L. Tanner, U. S. N. There are several illustrations in the bulletin.

This Society was organized March 16, 1881, and has its office and library in Mercantile Library Building corner Van Ness Avenue and Golden Gate Avenue. Its objects are, to encourage geographical explorations and discovery; to investigate and disseminate geographical information by discussion, lectures and publications; to establish in this, the chief city of the Pacific States, for the benefit of commerce, navigation and the industrial and material interests of the Pacific Slope, a place where the means will be afforded of obtaining accurate information, not only of the countries bordering on the Pacific Ocean, but of every part of the habitable globe; to accumulate a library of the best books on geography, history and statistics; to make a collection of the most recent maps and charts—especially those which relate to the Pacific Coasts, the islands of the Pacific and the Pacific Ocean; and to enter into correspondence with scientific and learned societies whose objects include or sympathize with geography. The Society publishes a bulletin, which it interchanges with geographical and other scientific societies. Monthly meetings are held, at which original papers are read, or lectures given, and to which, as well as to the entertainments to distinguished travelers, to the conversations, and to the informal evenings, the members of the Society have the privilege of introducing their friends, in accordance with the provisions of the By-Laws.

The officers for the current year are: President, George Davidson, Ph. D. Sc. D.; vice-presidents, T. E. Slevin, LL.D., Justice Ralph C. Harrison, Rev. Robt. Mackenzie, D. D.; treasurer, Harry Durbrow; home corresponding secretary, Hon. Jeremiah Lynch; foreign corresponding secretary, P. W. Poulson, M. D.; recording secretary, John Partridge; assistant secretary, T. F. Trenor, M. A. Board of Directors—Thos. E. Slevin, John Partridge, Alfred S. Lowndes, Harry Durbrow, Louis L. Nelson, Capt. C. L. Taylor, Prof. George Davidson.

Council—Hon. Jeremiah Lynch, John Dolbeer, Hon. J. V. Coffey, Rev. Robt. Meckenzie, Capt. W. L. Merry, Hon. Ohas. Goodell, F. Steven Cook, M. D., Mark Sheldon, Wm. Hood, C. E., P. W. Poulson, M. D., Justice R. O. Harrison, Capt. C. L. Taylor.

This society has a large membership and is quite active. A great number of important papers have been read before it, as appears from the list printed in the *Bulletin*. The prospects are now brighter than ever, as its utility and authority in the field of scientific research are acknowledged. The increased numbers attending the meetings show the interest taken in scientific matters. During the year 1892 ten lectures were given, all very fully attended.

Underground Temperature.

In answer to a question as to the method of taking temperatures of rocks at different depths in mines, a description may be given of that adopted by Charles Forman in determining the temperatures in the Forman shaft some ten years ago. The temperatures were taken from the surface to a depth of 2300 feet. They were ascertained by drilling holes not less than three feet deep into the rock and inserting into the hole a Negretti and Timbra slow-acting thermometer of the pattern adopted by the Underground Temperature Committee of the British Association and standardized at Kew. These holes were closed with clay, and the thermometers were left in for 12 hours, not less than three holes being tried at each point. The following are the depths in feet and the temperatures in degrees Fahrenheit:

Feet.	Deg.	Feet.	Deg.
100	50½	1300	91½
200	55	1400	96½
300	62	1500	101
400	60	1600	103
500	68	1700	104½
600	71½	1800	105½
700	74½	1900	106
800	76½	2000	111
900	75	2100	119½
1000	81½	2200	116
1100	84	2300	121
1200	89½		

It may be stated that more accurate results might have been attained had the holes been filled with water, the thermometers put within a foot of the bottom, the holes then plugged, and the thermometers left for 12 hours. In the dry state the average heat of the rock is not so well

ascertained as it is when equalized by the water. However, the results would not differ very greatly. Of course, higher temperatures than this are experienced in certain drifts and close places in a deep mine, but it was the actual temperature of the rocks which was desired. In the record quoted, no mention is made of the varying characters of the rock itself.

Coast Industrial Notes.

A FIFTY-SIX-FOOT steamer, to be run by storage batteries, is being built at Tecome.

THE new electric railroad on Eighth street, Oakland, was put in operation on Saturday of last week.

UKIAH, Mendocino county, is considering a proposition to issue \$60,000 in bonds for a sewerage system.

THE Columbia river salmon canneries failed to complete their combination, and each will work for himself this season.

A SAN DIEGO paper says that a strong movement is under way at the head of the bay to start a co-operative beet-sugar industry.

THE Von Schmidt dredger is at work off the Sessions property in East Oakland, on the harbor contract originally let to John Heckett.

A SIX-STORY block, after the plan of the Mills Building, will shortly be erected on the old Hibernia Loan and Savings Society property, corner of Post and Montgomery streets.

STOCKTON capitalists are considering an electric power transmission scheme, by bringing the power of one of the mountain streams to operate a railroad between that city and Lodi.

UTAH's total gold output for 1891 was \$31,644; for 1892, \$31,926; showing an increase of \$282. The silver output for 1891 was 8,750,352 ounces; for 1892 it was 7,762,269; showing a decrease of 988,096 ounces.

THE new steam whaler Jeannette, Captain Newth, is the best appointed whaling vessel ever built in the United States. She was constructed at Turner's yard at Benicia, has a fine model, powerful engines and is well fitted out in every way.

NOTWITHSTANDING the shut down of the Harney Peak Co.'s tin properties in Dakota, the Deadwood Pioneer still believes that, with proper management, there are a number of tin mines in the Black Hills that will pay a reasonable interest on the investment.

THE California World's Fair Commission has appointed a committee to confer with C. F. Smurr of the Southern Pacific line, with a view to procuring reduced rates for California World's Fair employees, and for tourists wishing to visit this coast during the fair season.

ONE of the best-posted shingle-dealers in Washington State, after a careful computation, estimates that Western Washington will this year ship east 1,500,000,000 shingles, an increase over last year of over 50 per cent. This product will be worth in round numbers \$2,000,000.

THE Bureau of Statistics of the Treasury Department gives out the following statement of the value of exports of breadstuffs from Pacific coast districts for the month of February: Oregon, \$21,103; Puget Sound, Wash., \$401,132; San Francisco, \$2,138,976; Willamette, Or., \$384,416. Total, \$2,945,527.

A KEEL has been laid at the Oakland shipyards for a 150-ton wrecking steamer to be called the Whitelaw. It is to replace the wrecking steamer of the same name recently lost on the coast near Russian Landing. It will be under the ownership of T. P. H. Whitelaw, and will be launched within sixty days.

It has been finally decided to remove the Wentworth boot and shoe factory from Oakland to Santa Rosa. A subsidy has been given by the Santa Rosa people in order to secure the removal. It is the purpose to establish a tannery in connection with the factory. The loss will be considerably felt in West Oakland, as it will throw about seventy-five men out of employment.

BUSINESS has commenced picking up on the Central Pacific, and it is expected that the coming season will be the busiest the road has ever experienced. The number of crews on the Truckee division will probably be doubled within the next few months, which will be an era of prosperity for the railroad boys. Meister Mechanic Hunt of Wadsworth is getting the motive power of his division in first-class shape for hard work during the spring and summer months.

THE great Hemet dam, near San Jacinto, San Bernardino county, is finished to a height of 110 feet, and is filled with water to a height of ninety feet. The lake is nearly two miles long, the widest place being three-fourths of a mile, making a surface area of nearly 750 acres. It is now five weeks since the outlet was closed, and this enormous body of water has been collected in the last two weeks. There is enough water impounded to irrigate 20,000 acres during the coming dry season.

F. M. SMITH, a resident of East Oakland, who is familiarly known as the "Borax King," is increasing his factories. There are few borax factories in this State that he does not own. Last week, A. L. Tubbs, as assignee of the Harmony Borax Mining Company, the Meridian Borax Company and the California Chemical Company, conveyed to Smith the borax works on Alameda point. The deal was made some time ago. The same conveyance takes in a number of other borax factories in various parts of the State.

NEARLY 2000 feet of Mission street, between Silver and China avenues, have been dug up and graded for the road-bed of the new Mission-street electric road, and about 200 feet of track have been laid from the proposed terminus at China avenue in toward the ferry terminus. Over 100 men have been employed since the work of roadbuilding commenced, and the force was increased this week. The

stormy weather has interfered to some extent with the work of rail laying and grading, but as soon as it becomes clearer rapid work will be witnessed. Ties, rails, iron and other material are now being strewn along the line from the Five-mile House to the ferries.

THE Blue Lakes Water Company, in which several Oakland capitalists are interested, is slowly making progress. It is proposed to pipe water from Plumas county to Oakland, supplying cities and towns on the way. The directors held a meeting in San Francisco a couple of days ago and decided to issue bonds in the sum of \$5,000,000. There will be 5000 bonds of the value of \$1000 each. The bonds are to run for 45 years. The directors present at the meeting were T. G. Phelps, J. S. Emery, M. J. McDonald, Daniel E. Hayes, A. T. Hatch, F. M. Smith, L. G. Harvey, Henry L. Davis, Joseph Britton, C. S. Wright and R. Mc F. Doble.

The narrow-gauge road of the Towle Bros., which starts out from the main Central Pacific line at Towle's Station, has now reached a length of thirty miles, and at its terminus they are finishing in time for the opening of the lumber season, one of the largest and finest mills ever built in the Sierra Nevada mountains. It will have band saws and be run by water-power, and will have a capacity of from forty to fifty thousand feet in twelve hours. Last year the company run three mills, but by running this new mill day and night, they expect with it and one of the others, to turn out lumber enough to meet their demands. The new mill is located near Deer Creek in Nevada county, and is in the midst of a fine body of timber. It contains all the latest improvements, was put up regardless of cost, and will be in all respects a model saw-mill.

WORK will soon be commenced on the new leaching plant for the Ontario mine, Utah. The tanks and vats will be constructed in California and shipped to Park City ready to be put together. The plant will be of monster proportions. So near as can be judged from the manner in which the surveys have been made the building will be about 450x250 feet. It is also estimated the old mill will be turned into a leacher, and that the present battery will be capable of crushing ore for both plants, as by the leaching process the ore does not have to be crushed so fine and the new rock-breaker recently placed will be a great help. The old Nos. 1 and 2 tailings dams will be first leached, after which the plant will be started on Ontario ore.

THE river steamer Empire City arrived at Modesto on the 13th, towing a barge loaded with 200 tons of iron pipe for the new water-works. This is the first freight brought up the river as far as Modesto since 1869. Upon the completion of the railroad all river traffic was abandoned. The contractors, W. T. Garratt & Co., tried the experiment, as railroad freights were considered excessive. Since it was settled that steamers could navigate the Tuolumne river to this point, freight rates have been reduced. If proper encouragement is given, the boat, which belongs to the Stockton Navigation Company, will make regular trips every ten days. The captain is negotiating to take a load of wheat back.

At the annual meeting of the members of the Mechanics' Institute, held on Saturday night last, the long mooted question of whether or not to erect a new library building was finally settled. It was unanimously agreed that a new building with all modern appliances will be, during the next three years, erected on the pavilion lot at Hayes and Larkin streets. The construction of the new building on the pavilion lot does not necessarily mean the destruction of Mechanics' Pavilion. The ground on Hayes street between Larkin and Polk and extending seventy-five feet northward toward Grove street, known as the pavilion annex, will probably be selected as the site of the new building. All the prominent local architects will be asked to submit plans for the new library building as soon as the committee appointed by the Board of Trustees to decide exactly what is wanted has reported. At the annual meeting, the new officers elected on February 20th last were installed, when the Board of Trustees selected the following officers for the ensuing year: President, A. S. Hallidie; Vice-President, Marsden Manson; Treasurer, Charles A. Malm; Recording Secretary, R. P. Doolan; Corresponding Secretary, Grove P. Ayres.

Foundry Notes.

On Monday last sixty men went to work in the new shops of the Fulton Iron Works at Harbor View. The principal stockholders visited the works that day and saw the first casting made, consisting of a bed-plate and condenser for a marine engine intended for a steam lumber schooner. Within a few weeks all the buildings will be ready and about 150 men set to work.

The Union Iron Works have just completed a large model of their extensive works, which is to be sent to the World's Fair. The exhibit consists of a miniature panorama of the company's plant, and measures forty feet square, being one-quarter of an inch to one foot of the actual grounds occupied by the corporation. The work is composed of highly finished mahogany. The foundries, machine shops, sawmills, pattern-rooms, dry docks, offices, and, in fact, every department of the mammoth institution is represented by small buildings, and each is furnished with an electric light, which adds greatly to the effect of the workmanship. The railroad tracks and the company's water-ways also figure in making the picture a perfect one. Upon the dock may be seen a miniature representation of the line of battle ship Oregon, now nearing completion, and in the bay to the east are to be seen perfect models of the vessels built by the company. Among them are the steamship Pomona, the steamship Peru, the tug Fearless, and the U. S. steamers Charleston, Monterey, San Francisco and Olympia. The derricks, railway tracks, etc., are all represented in miniature. The large hydraulic dry-dock is also represented with a vessel upon it. The entire model was made at the Union Iron Works and cost be-

tween \$10,000 and \$15,000. The models of the vessels are particularly fine specimens and the whole model of the plant bears the marks of very skillful workmanship.

Personal.

RUFUS SHOEMAKER, well-known throughout the mining regions of this State, died at Grass Valley last week. He has been editor of the Grass Valley Union and Daily Tidings, and was editor and proprietor of the Grass Valley Telegraph at the time of his death.

EX-STATE MINERALOGIST WILLIAM IRELAN, JR., has been appointed by the California World's Fair Commission superintendent of the mineral exhibit of this State, and will go to Chicago in charge of the specimens.

REPRESENTATIVE CAMINETTI has been talking with the Secretary of War about the commission to be appointed to execute the provisions of the hydraulic mining bill. He wants the instructions to be broad in their scope and worded so as to give practical effect to the measure.

THE gentleman who wrote in the Forum, the article on "Cost of Producing Silver and the Profits of Mining," is James D. Hague, the well-known mining engineer, who was the author of the volume on the "Mining Industry" in Clarence King's Reports. He was at first geological assistant of King's corps, and has been prominently connected with geological and mining matters for many years. Notwithstanding, he is called in several mining papers, James D. Hoque, James D. Hayne or James D. Hague. Even in San Francisco, where he long resided, Mr. Hague's name was badly mixed in the daily papers.

Some Points in Silver-Milling by Amalgamation.

NUMBER IV.

Written for the MINING AND SCIENTIFIC PRESS by C. H. AARON.

The settler, as now generally constructed and operated, has the defect of allowing a gradual accumulation of the coarser and heavier part of the tailings, as well as permitting a stone, hammer-head, or any such matter, to cause considerable trouble if dropped in by any means, as will sometimes occur. As to the coarse sand, the practice is to remove it from time to time by hand, and, as it is mixed with amalgam and quicksilver, it must be ground in a pan in order to separate those and wash the sand away. I have found a way in which to wash coarse sand out of the settler while retaining the quicksilver and amalgam. The method has been published in these columns already and I need not repeat the description of it here.

I have heard many stories about "iron amalgam" and the trouble it gave in the melting of the bullion. Were I to confine myself strictly to my own experience, I could say but little about iron amalgam, as I have never made it in such proportion as to give trouble, nor have I been able to find out all of the causes of its production. I think a good millman need not make it. Iron is not susceptible to amalgamation unless by the aid of sodium or potassium, but apparent amalgamation may arise from the coating of ferruginous particles by lead or copper, to which quicksilver adheres and envelops the particle, which then enters the amalgam. Such ferruginous particles may be due to abrasion of the shoes and dies when the ore is ground in the pan, or to imperfect roasting of the ore by which a peculiar iron oxide is formed which has the property of precipitating copper, and probably lead, from reducible salts of those metals.

When the amalgam is thus contaminated the proper treatment is to work it thoroughly in the "clean-up pan," which is found in every well-equipped silver mill, first with water and lye, which is better if warm, and then under a flow of clean water. In this way the amalgam is rubbed off from the iron particles and they are washed away. All dirty amalgam and hard scale from the pans is similarly treated, fresh quicksilver being added if necessary. I once got a \$400 bar out of a pile of pan scale which I found on the ground outside of a mill, where it had been thrown by some "muscular amalgamator."

If amalgam containing much iron is retorted, it is hard or impossible to melt; the remedy then is to add sulphur, which combines with the iron, forming a fusible sulphide floating on the silver. As the requisite quantity of sulphur cannot be certainly applied, it is necessary to put some pieces of iron in the pot to reduce any silver sulphide which may be formed. Copper, if present, will also combine with sulphur, and then some loss of silver is inevitable and the matte must be saved for further treatment.

When coppery amalgam is retorted, the copper and silver separate to some extent. Contrary to my expectation, experiment showed that the separation is more nearly complete when the retort is heated quickly. I have often taken red copper and snow-white silver from the same retorted, spongy mass, but there were also intermediate grades. If the retort is opened while still very hot, as is often, though very improperly done, the copper may become oxidized and may then cause trouble in the melting. I have seen an inexperienced melter in great difficulty from this cause. He had a mess like a potpie in his pot—liquid silver with great lumps of infusible matter in it, which consisted of copper oxide mixed with silver and just so plastic that no amount of borax could liquefy the copper oxide. The man called that iron amalgam; perhaps others may have made a similar mistake. In the next melting I caused charcoal to be mingled with the metallic sponge in the pot; then covering and heating the oxide was reduced to metal and the copper-silver alloy melted readily, after which borax was added to slag the impurities. Copper may be removed from silver by means of sulphur, but the matte retains much silver, despite the presence of metallic iron, and the silver is liable to retain sulphur.

Very leady amalgam may be strained through flannel bags under hot water; that which remains in the bags is enriched, while that which passes through them is compar-

atively poor in silver and may be strained, when cool, through canvas as usual; the quicksilver which passes through still retains lead and a little silver.

When it becomes necessary to retort a large quantity of quicksilver to purify it I proceed as I stated in this paper some years ago, as follows: Into the upper side of the retort I tap a half or three-quarter-inch pipe, passing through the brick arches above, which is bent as an S tube and is surmounted by a funnel. The interior of the retort is painted with a paste of clay and ashes mixed with water, and the closure is luted with similar material in which the clay and ashes are so proportioned, by trial, as neither to crack nor peel off in drying; a little salt may be added with advantage. The retort is then dried and warmed by a small fire, after which several flasks of the quicksilver are poured in through the S pipe in the bend of which some remains, forming a valve which prevents the escape of vapor. The heat is then increased until the quicksilver begins to distill, when that temperature is maintained steadily. As the metal comes over it is replaced, flask by flask, by means of the pipe until all is finished, and, when cold, the retort is opened and a cake of lead is found. I am told that, in order that the distilled quicksilver may be quite clean, some powdered charcoal should be put into the retort before closing it; a little lime is also beneficial.

The life of a retort depends greatly on the care used in raising the heat slowly to the degree at which the mercury begins to distill, and then keeping as nearly as possible uniform temperature until the discharge slackens, when the heat must be again raised to dull redness and so maintained until no more quicksilver comes over, and the pipe is readily cooled by throwing water on it near to the body of the retort. With a properly mounted retort, as most are in these days, a good guide to the final temperature is that the end of a pine stick rubbed on the front end of the retort is charred and the streak of carbon left by it sparkles a little and burns off.

It is dangerous to open the retort while it is still hot, though that is often done; there is always some fume which is likely to injure the workman. With much lead in the amalgam, melting of the metal cannot be avoided, and the result is a solid slab, which, however, is easily cut to pieces on the blacksmith's anvil; but fine silver, or silver and copper, should never be melted in the retort; it should remain as a spongy mass, easily broken by means of a hammer for the crucible. The end of the pipe should never dip into water; a cloth wrapped around it should connect the pipe with the water in the vessel which receives the mercury, the pipe being kept cool by some kind of water-jacket. If the end of the pipe be submerged, a slight cooling of the retort causes the water to back into it, when an explosion occurs. This warning will not be needed by any experienced millman, but may be useful to some of our "new chums."

In regard to crushing appliances much might be said depending on different conditions; I prefer to say nothing rather than too little. As to furnaces and roasting also, I must plead the statute of limitation, indulging in only one remark. Where the inclined cylinder furnace is used I look on an auxiliary fire as a nuisance, and a needless waste of fuel. I much prefer Thompson's dust-returning apparatus, and, though I was never so fortunate as to have it, I satisfied myself of its utility by the aid of a couple of boys in Honduras. As, however, boys, in Honduras as elsewhere, object to being half roasted and suffocated, I adopted another plan, which suited me better than an auxiliary fire which I could not get properly attended to, and which largely increased my fuel consumption. When the flues were cleaned I piled the imperfectly roasted stuff on the ore-floor and, stopping the battery, passed the dust into the furnace by means of the screw-feeder. To my gratification, and slight surprise, it passed through very well, not much more than the usual proportion going again to the dust chambers. It is a curious fact that, in roasting with these furnaces, while 15 or 20 per cent of the ore may go to the dust chambers, that same "dust," if collected and passed in, will go through with about the same proportional loss. On the other hand, the ore which has passed through with a loss of 15 per cent or more in the dust chambers, will, if passed in again on account of imperfect roasting, lose nearly as much as it did before.

I will now conclude for the present, hoping these notes may be useful, and desiring, while frequent disappointment in similar cases almost forbids hope, that others may be stimulated to give us the benefit of their experience to some extent. As to my few remarks on the great question of the silver market, while I freely acknowledge the right of every person to have and to express his views, I decline in advance to enter into any controversy. I have given my idea; let others do the same if they so choose.

NOTE.—The operation of the Boss process may be thought to contradict my idea in one respect. In this process the ore pulp passes continuously through a series of pans and settlers. The first two pans are intended to grind the ore and no quicksilver is put into them. No doubt the silver is, more or less, metallized in the grinding pans and yet the process is very successful.

Two facts must be considered in this connection: Firstly, a portion of quicksilver finds its way from the amalgamating pans to the grinding pans, by regurgitation or counter-currents in the connecting channels; probably, however, this is not sufficient to amalgamate all of the reduced silver, though the fact that, in working the chloride ores of the Calico district, nearly all of the silver is collected in the first amalgamator of the set may throw a doubt on this. Secondly, bluestone as well as salt, is always used in the amalgamators, even in working ores; which would not seem to require it if treated in single pans, as usual; the chemicals are dropped in at brief intervals by automatic apparatus. The cupric chloride thus formed converts the metallic silver to chloride, which is again metallized by the iron pan, and amalgamated in the act.

I know an operator in Calico who claims to work closer than others, though getting more coppery bullion, because he uses more bluestone than others, preferring to make poorer tailings, even though the bullion may be of rather lower grade, because the greater part of the copper added in the form of bluestone must ultimately find its way into the amalgam so long as iron amalgamators are employed.

Thus, when all of the facts are taken into account, my theory is sustained rather than opposed by the action of the Boss process, if that can be called a theory which is the result of repeated experience and observation.

C. H. A.

The New Administration.

The accompanying portraits of President Cleveland and members of his Cabinet are direct from photographs and are, we believe, the best pictorial representation of Mr. Cleveland and of the men who are to be his advisors yet printed on the Pacific Coast. The list includes, besides the President,

Hon. Walter Q. Gresham, of Indiana, Secretary of State.
Hon. John G. Carlisle, of Kentucky, Secretary of the Treasury.
Hon. J. Sterling Morton, of Nebraska, Secretary of Agriculture.

exercise is deemed necessary to maintain our National credit or to avert financial disaster." The meaning of this in plain terms is that Mr. Cleveland will not permit gold to go to a premium if, by the sale of bonds or any other financial expedient, he can keep the Treasury supplied with gold. And, taken in connection with his well-known position on financial questions, it means further that he will not permit a free silver coinage proposition to become a law if he can prevent it by the use of the veto power.

From the currency question, Mr. Cleveland passed to a review of what he called "governmental favoritism." It stifles, he said, the spirit of true Americanism and stupe-

paid to sugar-planters in the South, and to steamship companies running to South American ports, done away with.

Proceeding to the consideration of the civil service, Mr. Cleveland declared it to be a plain dictate of honesty and good government that public expenditures should be limited by public necessity and that this should be measured by rules of strict economy. One mode, he said, of misappropriation of public funds is avoided when appointments to office, instead of being rewards of partisan activity, are awarded to those whose efficiency promises a fair return of work for the compensation paid them. Civil

PRESIDENT CLEVELAND AND HIS CABINET.

Hon. Wilson S. Bissell, of New York, Postmaster-General.
Hon. Hoke Smith, of Georgia, Secretary of the Interior.
Hon. Hilary A. Herbert of Alabama, Secretary of the Navy.
Hon. Daniel S. Lamont, of New York, Secretary of War.

The single other member of the Cabinet, Hon. Richard Olney, of Massachusetts, Attorney-General, we are not able to present at this time, as no perfect photograph of him has yet been received at San Francisco.

Mr. Cleveland's inaugural address was briefer than his public utterances are wont to be. The first point touched upon was the currency. There is nothing, he said, more fatal to our supremacy as a nation than the want of a stable currency. We cannot, with all our strength and resources, defy the inexorable laws of finance and trade. He then referred indirectly to the dangerous condition of the National Treasury, adding: "So far as the executive branch of the Government can intervene, none of the powers with which it is vested will be withheld when their

fies every ennobling trait of American citizenship. The lesson of paternalism, he declared, ought to be unlearned and the better lesson taught, that "while the people should patriotically and cheerfully support their government, its functions do not include the support of the people." Continuing, he said: "The acceptance of this principle leads to the refusal of bounties and subsidies which burden the labor and thrift of a portion of our citizens to aid ill-advised or languishing enterprises in which they have no concern. It leads also to the challenge of the wild, reckless pension expenditure which overleaps all the bounds of grateful recognition of patriotic services, and prostitutes to vicious uses the people's prompt and generous impulse to aid those disabled in their country's defense." Reduced to plain terms, this means that Mr. Cleveland will urge a revision and purification of the pension laws, and that he will oppose any further extension of the pension system; that he will endeavor to have the bounties now

service reform had already accomplished much, he declared, and its promises of further usefulness entitle it to the ready support of all who desire to see our public service well performed, and who hope for the elevation of political sentiment and the purification of political method. With reference to the growth of trusts, Mr. Cleveland said:

The existence of immense aggregations of kindred enterprises and combinations of business interests, formed for the purpose of limiting production and fixing prices, is inconsistent with the fair field which ought to be open to every kind of independent activity. Legitimate strife in business should not be superseded by enforced concession to the demands of combinations that have power to destroy, nor should the people to be served lose the benefit of cheapness which usually results from wholesome competition. These aggregations and combinations frequently constitute conspiracies against the interests of the people, and in all their phases they are all unnatural and opposed to our American sense of fairness. To the extent that they can be reached and restrained by Federal power, the Gen-

eral Government should relieve our citizens from their interference and exactions.

The longest paragraph of Mr. Cleveland's brief address was with reference to the tariff, and we give it in full, as follows:

The people of the United States have decreed that on this day the control of this Government in its legislative and executive branches shall be given to a political party pledged in the most positive terms to the accomplishment of tariff reform. They have thus determined in favor of a more just and equitable system of Federal taxation. The agents they have chosen to carry out their purposes are bound by their promises, not less than by the command of their masters, to devote themselves unremittently to their service. While there should be no surrender of principle, our task must be undertaken wisely and without vindictiveness. Our mission is not punishment, but the rectification of wrongs. If, in lifting the burdens from the daily life of our people, we reduce the inordinate and unequal advantages long enjoyed, this is but the necessary incident of our return to right and justice. If we exact from unwilling minds acquiescence in this theory of an honest distribution by the hand of government of the beneficence treasured up for all, we but insist upon the principle which underlies our free institutions, and we tear aside the delusions and misconceptions which have blinded our countrymen to their condition under vicious tariff laws, we but show them how far they have been led away from the paths of contentment and prosperity. When we proclaim that this necessity for revenue to support the Government furnishes the only justification for taxing the people, we announce a truth so plain that its denial would seem to indicate the extent to which judgment may be influenced by familiarity with the perversions of the taxing power, and when we seek to reinstate the self-confident business enterprise of our citizens by discrediting abject dependence upon Government favor, we but strive to stimulate these elements of American character which support the hopes of American achievement.

In this utterance Mr. Cleveland distinctly reaffirms the pledge of the Democratic platform; and it becomes pertinent to give again the exact provisions of that platform. This is especially important because of the persistence of the partisan press in misconstruing and mistaking the facts. The radical journals and the radical party leaders are fond of repeating the utterly misleading statement that Mr. Cleveland's party is bound to immediately enforce free trade and that Mr. Cleveland is bound to urge such a policy upon Congress. The renewal of this pledge by Mr. Cleveland will afford a text for still further false and mischievous talk, and to the end that our readers may be prepared for it and in a position to estimate all such blarney at its full value, we give again the exact text of the Chicago platform with respect to the tariff:

The necessity of the Government is the only justification for taxation, and whenever a tax is unnecessary, it is unjustifiable; that when custom-house taxation is levied upon articles of any other kind than those produced in this country, the difference between the cost of labor here and labor abroad, when such a difference exists, fully measures any possible benefits to labor, and that the enormous additional impositions of the existing tariff fall with crushing force upon our farmers and workmen, and, for the mere advantage of the few whom it enriches, exact from labor a grossly unjust share of the expenses of the Government; and we demand such revision of the tariff laws as will remove their iniquitous inequalities, lighten their impositions and put them on a constitutional and equitable basis.

But in making a reduction of taxes, it is not proposed to injure any domestic industries, but rather to promote their healthy growth. From the foundation of the Government the taxes collected at the custom-house have been the chief source of Federal revenue. Such they must continue to be. Moreover, many industries have come to rely upon legislation for their successful continuance, so that any change in the law must be at every step regarded of the labor and capital thus involved. The process of reform must be subject in its execution to this plain dictate of justice.

There is in this no promise to wipe out the tariff laws. There is a promise to reform the tariff upon lines of reduction, but guarded by a pledge to be "subject in its execution to the plain dictate of justice." We make space for this quotation from the Democratic platform because it is essential to a fair comprehension of Mr. Cleveland's remarks on Saturday last.

In our judgment—with the Democratic platform and Mr. Cleveland's re-affirmation of its pledges in view—there is no reason to fear a sudden and damaging revision of the existing tariff laws. The necessities of the Government (including the pension charges) now amount to between four hundred and five hundred millions per year; and it is not likely that there will be any reduction until the pension list declines, as it will in time. There is no way to raise this enormous sum excepting by the tariff and revenue charges. The total income from these charges is not more than enough to meet the public necessities. In all likelihood some bounties and some pensions will be cut off, but they will not be sufficient to allow any very great decrease in either of our sources of financial supply. Under these circumstances, free trade or anything like it is out of the question. We take comfort in the opinion that those California interests which are bound up in the continuance of the tariff policy are not in danger from the Cleveland administration.

SENATOR STANFORD has made arrangements to erect a very large and complete wine-cellar and warehouse at Port Costa in which to store his wines and brandies made at Vina and to accommodate any others who wish to store their products there. The new buildings are to be located on the edge of deep water to facilitate the shipping of the wines and brandies. The warehouse will be regularly bonded. Senator Stanford and his wine manager, Captain McIntyre, decided on Port Costa as furnishing the best climatic conditions for storage of wines. The construction of buildings will probably be commenced very soon.

EX-CITY SURVEYOR MCGINNIS, J. W. McGinnis and J. R. Carty, of Yavapai county, Arizona, have bonded to William H. Guernheim, of St. Louis, a director in the Yuma Copper Company, the Bald Mountain, Sunrise, Gold Star, Amodeo, Potosi, El Dorado and Ontario mines, with the Gold Star millsite and spring, all about eight miles south of Castle Creek hot springs, for \$12,000.

Geology and Its Bearing on Economic Questions.

SAN FRANCISCO, March 14, 1893.

TO THE EDITOR:—Geology is sometimes thought of as a science which has nothing particular to do with the practical affairs of life—a science dealing with the remote past, the theories of which concern only those of a speculative turn of mind. The falseness of this idea I hope to illustrate in the following article:

Geology is the science of the earth, treating of its history as exemplified in the present physical features—the mountains, valleys, plains, the various rocky strata, their structure, composition and mineral contents. It has two aspects—the one purely scientific and the other economic or practical. On the scientific side, an attempt is made to explain the causes and succession of the various phenomena and the principles governing their action. Economic geology, on the other hand, treats of the rocks, minerals, soils, etc., from the point of view of values. It is one of the legitimate objects of a Mining Bureau. So intimately is the economic connected with the purely scientific, and in part dependent on it, that a certain amount of work in the latter line is absolutely necessary.

In this State, where our material prosperity is so largely dependent on the successful development of the mineral resources, an understanding and appreciation of the principles of economic geology become of the highest value.

While it is not the province of the State to assume the role of prospector, it is its business to investigate the various sections where minerals are known to exist, or are likely to be found, and from a study of the geological conditions obtaining to report upon their probable extent and value. The reliability of this report depends upon the accuracy with which the rock formations have been studied.

The character and extent of mineral deposits is dependent on geological structure. The presence or absence of coal and oil-bearing rocks is determined by a study of the age of the formation—a study based to a great extent on fossils. The likelihood of obtaining artesian water in a given locality is a problem which can be solved either by costly experiment or by an examination of the position and character of the strata.

The argument is advanced by some that the U. S. Geological Survey has been at work for many years in the State, and that it is useless to go over the same ground. The work of this survey is more of a technical nature, and its publications do not reach the mass of the people which the State publications would; besides, the vast collections of the survey are taken to Washington.

In the chief mineral districts, the geological work should include a careful mapping of the rock formation with location of the mines and mineral deposits, thus showing the relation of the latter to the formation, this map to be accompanied by a description of the extent and value of the minerals. This should be so reliable as to be of practical use to intending investors. The Bureau thus should be able to assert in what parts of the State investments in certain lines would pay and where not.

The excitement caused by reported rich discoveries, and the often consequent useless expenditure of time and money, would be proper subjects for investigation. A knowledge of the geology of such districts would aid very materially. There is a large area along the eastern border of the State supposed to be rich in minerals, but no reliable report has ever been made upon it.

The separation of the cretaceous and tertiary coal-bearing rocks from the older series in which coal and oil are not found is one of the most difficult problems to be solved, and one of very great importance. During the past two years the Bureau has discovered the key to this problem, and now further work through the Coast Ranges will define the boundaries of the two formations. By reason of the prime importance of coal and oil in this State, this question demands our attention. It would save many thousands of dollars in useless exploration if those areas were defined in which those products could not be found. To my personal knowledge, there has been considerable useless exploration carried on in San Luis Obispo county for coal and oil in rocks which have lately been proved to belong to a formation which in California does not contain these products.

The supply of water is another vitally important question. The sinking of artesian wells without a proper knowledge of the geological structure of the region often involves the loss of large sums of money. Of course, flowing wells will be struck experimentally, but how much more economical to have some definite knowledge on which to work.

Besides the saving of money, the reports of a geological survey as it is extended over the State would encourage the founding of many new enterprises, giving, as it would in the successive report, authoritative statements as to where certain minerals are to be found, their extent, accessibility, etc. This has always been found to be the case, although in reaching this degree of reliability many investigations have to be carried on which in themselves are not of any practical value.

In Minnesota, there has been a phenomenal growth of iron-mining, due in part to the investigations of the survey. In Ohio, Indiana and Pennsylvania, the surveys have laid the foundation for the greatly increased product of coal. In England, the Geological Survey predicted that the coal measures would be found to underlie a certain district where, to the ordinary observer, there were not the slightest indications. Several years later, during an experimental drilling, this prediction was verified.

There is a great deal that passes for geology that is not geology, and the subject as a science is thus often brought into disrepute among practical men. This is not the fault of the science, but of some of its followers.

As one of the lines of investigation of a State Mining Bureau, it seems to me it cannot be given too much prominence, for, properly carried on, it must result in attracting much capital, while on its scientific side it would be a great educational factor through the large collections of rocks, minerals and fossils. The State Museum, with the fine be-

ginning which it has made, would in time contain a complete representation of the mineral wealth of the State.

HAROLD W. FAIRBANKS.

The Cost of Silver.

TO THE EDITOR:—A few days ago you expressed some surprise at the attitude recently assumed by the "silver men," and it does, at first sight, seem paradoxical that people who pose as the friends of silver, that is, by implication at least, and of the silver-mining industry, should have taken pains to show that silver mining is not profitable.

I, for my part, have long been convinced that neither gold nor silver is practically worth to the world what it costs the world in the form of labor and of wealth produced by other industries, to say nothing of what may be called moral or sentimental considerations. But the same may be said of diamonds and whisky. The world could get along very well without either one of the quartette, and without many other things things that might be mentioned were it not for habit.

If we should charge the precious metals with all the toil and tears, the rock-breaking and the heart-breaking, the sweating and swindling, the facility which they, as coin, afford to all manner of vice and evil-doing, even as they facilitate commerce and well-doing, the blasted lives of many whom their glitter has allured from the path of useful industry to ways of suffering and hardship, to moral degradation and physical destruction, it might well be questioned if they are worth their cost.

But the gentlemen alluded to do not propose to go so deeply into the matter. They only propose to show that the ounce of silver for which the world is willing to give an amount of more or less useful service, represented by 83 cents in gold, really required for its production more than that amount of useful service; for money, of no value in itself, is simply a certificate of useful service, actually or supposititiously rendered, and entitling the holder to receive an equivalent amount of service in return.

It does seem like a queer way in which to promote the interests of silver mining. Do the "silver men" think that the world will pay more than it has to for silver, just because a certain number of people have been unsuccessful in their search for the metal? They are not such fools! What then is their object? What end do they propose to attain by their apparently paradoxical course?

There are three ways in which the price of silver, as measured in gold, might be enhanced: Firstly, by increasing the output of gold. This the silvermen are incompetent to do to any appreciable extent. Secondly, by increasing the utilization of silver. This they have tried to do and have failed so far. Thirdly, by reducing the production of silver.

There are two ways in which the output of silver might be reduced: Firstly, by the "silvermen" (and their special clients) ceasing to produce silver—in other words, "shutting down" their mines. Secondly, by inducing others to stop and deterring new investors. The supply of silver being reduced, those who shall have kept their mines open will reap the benefit of a better price for the product, at least for a time—perhaps long enough to put them "on velvet." After all, the silvermen may not be so illogical as they seem.

However, it is probable that silver production will always cost more than it will come to. If the price should be raised, prospecting and investment would increase, and an increase in the production would again lower the price. Even should the price not be again lowered, it is morally certain that so long as one man, or a few men, shall be making large gains by silver-mining, so long will many be wasting the wealth derived from other industries in futile efforts to enter the small circle of the successful. They know full well that if all should succeed, all must fail. They are spurred on, each for himself, in the hope that he may be the chosen one. This is, and always has been, the way of the world.

Mining for the precious metals is a legitimate business, yet it resembles gambling in one respect, namely, that it has many blanks to one prize. It lacks the essentially pernicious feature of gambling in that one man's gain is not another man's loss, as in vulgar betting on cards or the like. It is simply this: The world wants gold and silver; gold and silver may sometimes be found in such abundance as to enrich the finder, and men who have more or less wealth, which is in so far superfluous that it may be dispensed with for the moment, are not deterred by the risk of loss so much as allured by the hope of gain.

Those who actually do the work of producing are not the losers, neither are they the prize-winners. The losers are those who invest the wealth which they have acquired by other means. They take their chance of winning, and run the risk of losing of their own free will. If silver is lower than it was, while gold is certainly lower also (more abundant), it is clearly because silver-mining has been remarkably successful on the whole; the crop has been good.

One thing is certain, so long as one man, or a few men, can furnish all the silver the world wants for 83 cents per ounce, the world will pay no more for it, no matter who may choose to get it out of the ground at greater cost in the hope of getting it at less.

The price of a commodity is regulated immediately by the relations of supply and demand, not by the cost of production; that affects the price indirectly by ultimately affecting the supply. If we should all stop eating wheat and use corn instead, the price of wheat would go down and that of corn would go up, regardless of the cost of production. The holders of wheat would lose and the holders of corn would gain; then the farmers would stop growing wheat. The price of wheat goes down when the crop is unusually large; nobody asks what it cost to grow.

I can see no objection to the coinage of silver at the present face value, if the deficit be covered by a gold fund and if the silver be bought at its market price. Free coinage, as I understand it, would be worse than debasing the coin of the realm; it would be a fraud on the nation for the benefit of a class.

C. H. AARON.

DUNCAN'S PRACTICAL SURVEYOR'S GUIDE

A new, revised and enlarged edition.—Just Ready.

THE PRACTICAL SURVEYOR'S GUIDE.

Containing the necessary information to make any person of common capacity a finished land surveyor, without the aid of a teacher. By ASHMAN DUNCAN, Land Surveyor and Civil Engineer. A new, revised and greatly enlarged edition. Illustrated by 75 engravings.

In One Volume, 15mo., 211 pages, price \$1.00. By mail, free of postage to any address in the world.

ABSTRACT OF CONTENTS.—Introduction; Object of Surveying; What a Survey Should Include; Definition of Points; Determination of a Straight Line and of a Plane Surface; Map of a Survey; Scales According to Which Maps of Surveys are Drawn; Instruments for Measuring Distances and Their Use; Instruments for Setting out Right Angles, and Their Use; Survey of Smaller Tracts with the Assistance of the Previously Described Instrument; Problems; Trigonometrical Surveying; Tables of Surveyors' Systems; Rectangular Surveying for Surveying the Public Lands of the United States; Index.

A circular showing the full table of contents of the above book sent free to any one who will apply.

Our New and Revised Descriptive Catalogue of Practical and Scientific Books, 88 pages, 800, and our other Catalogues, the whole covering every branch of Science applied to the Arts, sent free and free of postage to any one in any part of the world who will furnish his address.

PUBLIC SALE

— OF A —

SILVER REDUCTION PLANT

THE TOMBSTONE MILL AND MINING COMPANY, having no further use for its mills and furnace at Charleston, will sell at public sale, on the property,

TUESDAY, MARCH 21, 1893, AT 3 P. M.,

To the highest bidder for cash: All of the property known as "The Charleston Mills," real, personal and mixed; consisting of one 20 and one 15-stamp silver mill; one 25-ton water-jacket lead smelter; dwelling house and other buildings; and including the land, flume, ditch and water right pertaining thereto; situated on the San Pedro river, nine miles from Tombstone, Cochise county, Arizona.

Terms of payment will be made known at the sale and ample time allowed to investigate the title to the property.

By order of the Board of Directors of the Tombstone Mill and Mining Company,
W. J. CHEYNEY, Secretary,
Tombstone, Arizona.

WITH 30 YEARS EXPERIENCE.

THE BLASDEL CONCENTRATING BELT COMPANY.

We are now having our new Improved Concentrating Belt manufactured in San Francisco. We keep always on hand Belts suitable for the Triumph and Frue machines, but can make any length or width desired. The advantages of these belts over any others will be readily seen by practical millmen. First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight rifled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. These slight rifles also save very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth. We can safely say that it is a better concentrator belt than has ever been manufactured. It will last much longer and will handle more pulp. We also manufacture smooth belts with same flanges when desired.

H. G. BLASDEL, Jr., Manager, 419 California St., San Francisco.

Mechanical Progress.

Cylindrical vs. Conical Cam Rollers.

Oberlin Smith writes to the *American Machinist* as follows:

As the subject of conical *versus* cylindrical cam rollers seems to have recently attracted a good deal of attention in your columns, I take the liberty of quoting from some remarks upon the same subject, contained in one of my essays upon "Machinery Designing," published in October, 1885. "It will be observed that all 'side cams' (and conical ones, too) should, in order to obtain a more perfect rolling contact with the roller, be adapted to a conical (rather than a cylindrical) roller, with the apex of its cone at the cam's axis, precisely as if it and the cam were, at any point of contact, a pair of smooth frictional bevel gears. This construction would avoid sliding friction of the roller whenever the follower was at rest—that is, where the cam was 'running true'; but at other points the rolling action would be more or less imperfect, dependent upon the follower's speed, inasmuch as such speed is at any point a measure of the cam's divergence from 'true running' at that point. Although a roller slightly conical would give a better average effect in avoiding friction and wear than a straight one, yet the trouble of making a tapering groove, and the disadvantage of the end-thrust upon the roller and the members to which it is attached, that is incident to such conical form, will usually counterbalance the benefit referred to. In most cases, therefore, a cylindrical roller is preferable."

It is obvious, as above intimated, that the principle of a conical roller is correct only when the whole of the cam groove lies in a normal plane, in which case it is no cam at all. If we go to the other extreme and run the groove parallel to the axis, the roller should be entirely cylindrical and the cam would be trying to move it at an infinite speed, making it therefore infinitely impracticable. If the groove always ran in a mean direction between these two extremes, or at about 45 degrees, the roller should be somewhat conical, but not so much so as if it were a bevel gear.

In actual practice, where grooves vary in direction from a normal plane to about 45 degrees therefrom, it is evident that an approximation only can be made to a correctly shaped roller. In some cases I would advise doing this for the sake of getting a less amount of grinding action upon the sides of the groove and roller, although at the expense of some of the end-thrust, which would not occur if the roller were cylindrical. The objection to this end-thrust can, however, where the work is heavy, be overcome by the use of a collar containing roller bearings, a scheme which was not so practicable a few years ago, before the "bicycle age" had commenced, with its brilliant object lessons in the use of ball bearings.

It must be remembered that the conditions so far considered have been those of a roller mounted upon a follower sliding in a straight line, lying in the same plane as the cam's axis. When, however, it is carried by a swinging lever arm, as is often the case, its own axis does not at all times intersect that of the cam, and there is then and therefore an additional deviation from the bevel-gear principle.

In conclusion, I would say that, while the construction above outlined may be desirable in some special cases, a cylindrical roller, of as large a diameter as possible, but with a short face, is probably, on the whole, the best thing to use in the majority of cases, especially in light work.

The Ferris Wheel.

On the Midway Plaisance at the World's Fair there will be an exhibit which is intended to rival in novelty the Eiffel tower. This will be the Ferris wheel. Its diameter will be 250 feet. The wheel is intended to convey passengers around a circle in cars, from which visitors will have a full view of the exposition grounds and buildings. The wheel will be 264 feet in height. Around it, suspended between the two crowns by steel trunnion pins, will be 36 passenger cars with a seating capacity of 60 persons each. The entire structure is of steel and somewhat resembles a huge bicycle wheel revolving between two towers. The principle of construction is somewhat similar to an old-style English breast water-wheel, in that it consists of a stiff outer crown, which is suspended from the center axle by a system of tension rods. The wheel practically consists of two wheels placed on the same axle, spaced a distance of 28½ feet apart and held together by struts and ties. The great axle is the largest piece of steel ever

forged in this country, being 33 inches in diameter, 45½ feet long, and weighing 56 tons.

The axle is supported by means of steel towers 137 feet high. These are each supported by four legs, two vertical and two inclined, connected at the base by eight huge portal struts, thus forming an almost solid arch of steel. The foundations of masonry beneath the tower taper from an immense base to a height of 18 feet and under this are piles and concrete. Passengers, while indulging in their novel trip, will be just as safe as while riding out to the grounds on a railroad train. Arranged in groups on the rods around the crown of the wheel are 300 incandescent lights of various colors. These will be alternately extinguished and relighted at night as the wheel revolves. The engines which are to revolve this structure are in themselves an object of interest. They consist of two link-motion reversible engines of 30-inch bore, 4-foot stroke and 2000 horse-power.

The Ferris wheel is to be located in the middle driveway of the Midway Plaisance, about 100 feet from one of the entrance gates. The driveway divides at the wheel, and passing on both sides converges after the wheel has been passed. It is the personal invention of G. W. G. Ferris, a bridge engineer of Pittsburgh, and head of the firm of G. W. G. Ferris & Co. Robert W. Hunt of the Robert W. Hunt & Co. Inspection Bureau is president of the Ferris Wheel Co.

Wire Shafts for Steamers.

Samuel P. Jerome, of N. Y., writes to the *Scientific American* as follows:

In view of the frequent and especially the several quite recent instances of the breakage of steamship shafts, it may be of interest to the general public, particularly to sea-going travelers, to know the results of some experiments recently made with an elastic shaft constructed of steel wires of small diameter, massed and bound together so as to secure all required strength, and to possess elasticity, both torsional and transverse, to a degree not possible in a rigid shaft.

Rigid shafts are broken, mainly because it is not possible to maintain exact and true lines of shaft bearings in ships of great length, and frequently because of undiscoverable flaws and imperfections in the shaft metal. Ships bend when sailing in rough and boisterous seas, and variations of atmospheric and water temperature expand and contract the metal of the hull, causing powerful bending strains which crystallize the metal of the shaft, weaken and ultimately destroy its vitality, until rupture and possibly serious disaster is realized.

In the construction of a wire shaft, every part, from the center to the circumference, comes under the observation of the expert in charge.

The experiments referred to show that when the shaft is in position, and when rotating stress is applied, a tensile force is exerted upon the individual wires and their several fastenings. Each is a unit of strength and sustains its pro rata of the total amount of stress. The law of action and reaction determines the amount. It cannot be greater than the available power of the engines of the ship in any given case.

The strength of the individual wires and of the fastening being known, it is practicable to ascertain the potential strength of the shaft as a whole. Suppose it to be made in five sections, its total length one hundred feet, and its diameter fifteen inches. The shaft will have twenty-five thousand No. 7 steel wires, each twenty feet long, with their fifty thousand fastenings. Each wire and each fastening will sustain a load of five hundred pounds without rupture or injury, making a total inherent strength of 37,500,000 pounds, twenty-five times greater in amount than the continuous force of an engine of 5000-horse power. A stress of 25 pounds only upon each unit of strength, each point of resistance existing in a wire shaft as named, will more than equal the force of such an engine.

The wires of each section are welded together at their ends, making a solid mass of steel upon which couplings are fixed for bolting the several sections together. The spaces between the couplings are inclosed in short metal bands holding the body of the wires of each section in their normal cylindrical form, at the same time permitting a transverse elastic or bending movement when the ship bends, also elasticity of torsion when powerful waves strike the propeller wheel, lessening, or altogether eliminating all risk of injury to the crank and engines.

An additional inherent element of strength becomes active when torsional stress is applied to the shaft, viz., the friction of the individual wires pressing one upon another.

The greater the stress, the greater will be the amount of friction.

If built with reasonable care and skill, such a shaft cannot be broken in any emergency or under the severest conditions.

The cost of building a wire shaft will also be very much less than that of a rigid shaft.

Scientific Progress.

Explosions and Explosives.

At the University College, Nottingham, Prof. Clowes delivered a lecture, under the auspices of the Midland Association of Colliery Managers, on the above subject. The lecturer stated that explosion being due to sudden expansion, it is necessary, when produced by heat, since the expansion must be considerable, to employ either gas or vapor. All ordinary explosives depend upon the production of a large volume of gas by a change similar to combustion; the heat expands this gas or vapor largely and augments the products. Any combustible gas or vapor can produce an explosion if it is suitably mixed with air, and the mixture is fired. Accidental explosions occur from this cause, but the explosive course is also utilized in the gas and petroleum engines. A solid combustible dust, mixed intimately with air, may also fire and cause explosion. All explosives employed for blasting purposes must, however, be self-contained and burn independently of the air. They must be able to undergo the explosive change with great rapidity, generating much gas or vapor and much heat. They must not generate noxious or poisonous gases or vapor by explosion, and must be compact and easy of transport. When used in the coal mine, they must not be able to fire air containing dust or fire coal-damp. Blasting powder answers most of these requirements, but it is unsuitable for the coal mine because it ignites fire-damp. The more powerful dynamite and blasting gelatine are safer than gunpowder in this respect. After describing the nature and properties of these modern nitro compounds, reference was made to the modern methods of firing them by detonation, which far exceeds the rate of firing produced by deflagration in gunpowder by means of a fuse. The explosion produced was proportionately increased in power, and the danger arising from the projection of sparks from the fuse was abolished. Fire-damp, when present in air, is exploded by a temperature of 650 degrees C. All ordinary explosions produce a temperature much higher than this, probably none of them below 2000 degrees; but it is found by experiment that the rapidly exploding modern explosives, although they produce a higher temperature than powder, are far less likely to fire gas or coal dust in the air. This is explained by the fact that gas requires time to kindle. In some experiments as much as ten seconds were found to be requisite, when the gas and air were heated above 650 degrees in order to kindle them. The powder, burning slowly, gives the requisite time; and, further, it projects glowing and burning particles into the air, which aid the kindling. Additional safety has been secured with the high explosives by mixing them previously with ammonium nitrate. This substance reduces the temperature of the explosion; and yet, by detonating itself together with the explosives, prevents the force from being too much reduced. Tamping with moist sand has been found to complete the safety of these modern explosives, when the weight of the cartridge used does not exceed eight ounces.—Invention, of London.

Brain Substance.

At a recent meeting of the Académie de Médecine, at Paris, Dr. Constantin Paul related his observations (Sem. Med.) on 11 cases which he had treated by means of injections of brain substance into the subcutaneous cellular tissue. Three of the patients suffered from chlorotic neurasthenia, three from classic neurasthenia, one from permanently slow pulse, and four from locomotor ataxia. The liquid used was a ten per cent solution of the gray substance of the brain of the sheep, sterilized by carbonic acid in Arsonval's apparatus; the injections were made into the lumbar or gluteal region, the dose being five cubic centimeters (80 minims) at most.

The treatment is reported to have been well borne, as a rule producing no reaction, either local or general. In these 200 odd injections made in the 11 patients, abscess or acneic pustules resulted in no instance; occasionally, however, slight lymphatic engorgement was observed, which disappeared in three or four or, at the most, seven days.

The first effect noticed by the patient was a sensation of increased strength and comfort, the previous muscular weakness diminishing rapidly. The vertebral pains and spinal hyperæsthesia disappeared after a few injections; the lightning pains of the tabetic subjects, the neurasthenic headaches, the insomnia, and the cerebral impotence all vanished in their turn. The appetite returned, and those patients who were previously dyspeptic now assimilated their food so well that they began to increase in weight. In the tabetics sexual power returned with the general improvement. The author, therefore, considers the injection of gray brain substance a nerve tonic of no mean value.

Dr. Paul compares a neurasthenic patient with an accumulator which it is impossible to charge. While the morbid condition lasts, he is unable to transform his food into force; after the least effort his muscular and intellectual forces are exhausted. But, it is maintained, the injection of cerebral matter in the manner described promotes the utilization of food and its due assimilation so that the nervous system now becomes a chargeable condenser by means of which the subject acquires force which he can dispose of at will. It should be noted that it is the nervous force which first returns in all these cases; subsequent to, and consequent to, and consequent upon this, the power to do intellectual and muscular labor comes back, the improvement in the condition of the blood following later on.

In conclusion, the doctor claims that the subcutaneous injection of brain substance alleviates and cures neurasthenia much more rapidly than the ordinary therapeutic measures—iron, arsenic, phosphates, opium, alcohol, etc.; and its action is more prompt and certain than that of hygiene alone, or that of suggestion, ovariectomy, or even electricity. *Merck's Bulletin.*

Spontaneous Combustion of Coal.

With respect to the ventilation of a cargo of coal, with the idea of removing inflammable gases, Professor Clowes, of Nottingham, has pointed out that this might itself be a source of danger. Four colliers were loaded with coal from the same seam, and by means of the same tips. Three were ventilated and proceeded to their journey to Aden. None of these reached the port, being all lost by the spontaneous firing of their cargoes. The fourth was not ventilated, and it reached Bombay in safety. There was little doubt that the air inclosed in the cargo was insufficient to give rise to dangerous heating, and that the introduction of additional air by ventilation enabled the heating to occur by supplying the requisite air. Coal which had heated in the air and begun to cool again was safe from risk of further heating; hence, storing coal in the air for a sufficient length of time before loading was a precaution which would be calculated to insure the safety of the cargo.

The following practical conclusions were submitted as deducible from the facts presented: 1. The danger of spontaneous firing of coal in large lumps is very slight; it is much greater with small coal, and greater still with dust. The increase of danger is due to the larger extent of surface exposed to the air in proportion to the mass of the coal. 2. Air-dried coal which contains more than three per cent of moisture is dangerous; if it contains less the danger diminishes, as the amount of moisture is less. The moisture present in the coal is a measure of its absorptive power for air, and the most absorptive coal is the most dangerous. 3. The danger is somewhat increased by the presence of pyrites, in large quantity, not because this heats the coal to any appreciable extent, but because, when moistened, it swells—breaking up the coal, and exposing a larger surface to the air. 4. Newly won coal should be shielded from the air as much as possible, to prevent the chance of rapid heating, and for the same reason it is best not to stack it in large heaps, since these retain the heat. Ventilation of the coal often adds greatly to the risk of spontaneous firing. 5. All external sources of heat, such as steam pipes, boilers and hot flues in the neighborhood of the coal, add very greatly to the risk of firing. Spontaneous heating becomes vastly more rapid when it is thus assisted by outside sources of heat.

Are You Going East?

Take the Santa Fe route. You will find it to your interest to call on or address the undersigned before purchasing tickets. No other line crossing the continent can offer you a trip combining equal comfort and pleasure. The only line running Pullman palace and tourist sleeping cars through to Chicago on the same train every day without change. Personally conducted excursions through to Boston leave every Tuesday. W. SMELTING and LEAD CO.,
416 Montgomery St., San Francisco

GOLD AND SILVER REFINERY
And Assay Office.

Highest Prices Paid for Gold, Silver and Lead Ores and Sulphurets.

— MANUFACTURERS OF —
BLUESTONE,
LEAD PIPE,
SHEET LEAD,
SHOT, Etc., Etc.
ALSO MANUFACTURERS OF
Standard Shot-Gun Cartridges.
Under Chamberlin Patent.

JOHN TAYLOR & CO.,
IMPORTERS AND DEALERS IN
ASSAYERS' MATERIALS, MINE
AND MILL SUPPLIES,
ALSO CHEMICALS, AND PHYSICAL, SCHOOL AND
CHEMICAL APPARATUS.

68 & 65 First St., cor. Mission, San Francisco
We would call the attention of
Assayers, Chemists, Mining Com-
panies, Milling Companies, Pros-
pectors, etc., to our full stock of
Balances, Furnaces, Muffles, Crucibles, Scor-
ifiers, etc., including, also, a full stock of
Chemicals.
Having been engaged in furnishing these sup-
plies since the first discovery of mines on the
Pacific Coast, we feel confident from our expe-
rience we can well suit the demand for these
goods, both as to quality and price.
Agents for the Morgan Crucible Co.,
Baltimore, England. Also for E. G. Dennison's
Silver Plated Amalgam Plates. The plates
of this well-known manufacturer are thoroughly reli-
able, and full weight of silver guaranteed. Orders taken
at his lowest prices. Our Illustrated Catalogue and As-
say Tables sent free on application.

NEW DISCOVERY.

Mines Revived and Miners Enriched

By the wonderful Man Arthur-Forrest Process,
Controlled by The Gold and Silver Extraction Mining
and Milling Co., H. A. T. Tabor, Pres.; LEONARD GOW,
V. Pres.; H. A. JONES, 24 V. Pres.; P. G. OOW, Techni-
cal Mgr. and Asst. Treas.; T. L. WISWALL, Gen'l Mgr.
and Sec'y; PETER MCCORDY, Treas.; W. L. COOPER, Eng.

TRADE MARK.

GLASGOW WORKS
The Cassel Gold Extraction Co.,
Limited, Scotland.
Also in Australia, South Africa,
New Zealand, Queensland, Etc.

General Office of Company:

Rooms 8, 9 & 10, Taber Grand Opera House
Block, DENVER, COLORADO.

Also mills in operation as follows, viz: The Denver Mill,
Denver, Colo.; The Livingston Old Mining Co., Boulder
Co., Colo.; The Puzzler Old Mining and Milling Co.,
Boulder Co., Colo.; The Cripple Creek Gold Extraction
and Power Co., Colo.; Calumet Gold Mining Co., Middle
Creek, Shasta Co., Cal.; The Shasta Gold Ex. Co., Middle
Creek, Shasta Co., Cal.; The Mercur Gold Mining
Co., Fairfield, Utah; Champion's M. Co., Hurvitz Dis-
trict, Yavapai County, Ariz.; The Crowned King and
Last Chance Mine, Yavapai Co., Ariz.; The Union Mines,
Maricopa Co., Ariz.; The Revenue Co. Old Mining Co.,
Revenue via Norris, Mont.; The Orelington Mining &
Milling Co., Orelington, Cherokee Co., Georgia; and
others in course of erection.

The object of this company is to introduce the Mac
Arthur-Forrest process.
We have purchased from the Cassel Gold Extraction
Co., of Glasgow, Scotland, the exclusive right for the
United States to use patents covering this process.

If you desire an experimental test communicate with
the secretary.

If the results of the tests are favorable, we will then
make arrangements to treat a quantity of not less than
five tons at Denver.
We are fully prepared to grant royalties to mine and
mine owners, or rights covering districts and counties.
The process consists of pulverizing the ore to a fine-
ness of about 50 mesh, and then subjecting the same to
an action of a very diluted solution of cyanide. A few
tubs especially constructed according to our diagrams,
for triturating, settling and filtering, is all that is re-
quired extra in connection with any kind of pulverizing
stamps or rolls.

The total cost, as a rule, does not exceed from \$2.50
to \$5.00 per ton.

The most desirable class of ores for this process
the so-called refractory gold ores, pyrites, hematites,
manganese and tellurium. We have also treated suc-
cessfully dry silver ores.

We will be pleased to answer any inquiries and fur-
nish any desired information. Address,

T. L. WISWALL,

P. O. Box 926. Gen. Mgr. and Secretary.

JOSHUA HENDY MACHINE WORKS.

NO. 51 FREMONT STREET, SAN FRANCISCO, CAL.

BUILDERS OF

"Sensible" Horse-Power Hoisting Whims.

(DAVIS PATENT.)

PRICES REDUCED.

The "Sensible" Hoist is the cheapest and beyond doubt the
best in the market. It is built entirely of iron and steel, mount-
ed on a heavy iron base plate, and is therefore very durable and
not affected by exposure to climatic influences.

The level gear on the drum shaft is loose, and, in hoisting,
drives the drum through a friction clutch. This avoids the re-
quent accidents occurring with other Whims, occasioned by the
breaking of the gear teeth when throwing them out of gear. In
lowering, the drum is pressed by a powerful screw lever against
brake woods at the opposite end. Perfect means of adjustment
are provided for the friction clutch and brake blocks.

As the drum is entirely independent from the driving gears
the operations of hoisting, dumping bucket and lowering can be
performed with the horse in constant motion, a feature not pos-
sessed by any other horse hoist in the market, and one that
greatly increases the capacity of the machine by avoiding the
loss of time due to stopping and starting the horse.

It is very light and compact, and very easily taken to pieces
for transportation by mules. The cost of erection is very small,
two men in half a day being able to put it in place ready for
work.

Weight of hoist, 1200 lbs. Total shipping weight, including
sweep, levers and sheaves, 1400 lbs.
Circulars giving Capacities and Prices furnished
on application.

Electricity.

Is the Steam Locomotive an Electric Generator?

A curious trouble was recently reported to us by a Pennsylvania telegraph man, says the *Electrical Review*. It seems that at a particular time each day the telegraph instruments at a certain railroad station indulged in curious freaks, emitting long sparks, shocking the operator and behaving in every respect as though there were a heavy lightning storm somewhere upon the line. The persistent regularity with which this trouble occurred, even on the clearest days, with no traces of atmospheric currents to be found, together with a careful but fruitless investigation for all known possible causes, served to deepen the mystery. It seemed to be one of those "spook" troubles which form the basis of many of those stories which make part of the stock in trade of every old-time telegrapher.

Things went on in this fashion until one day the operator noticed that the sparks from the instrument seemed to keep time with the blasts of steam from a locomotive which was standing immediately below the troubled wire. Following up this clue, it was found that the spark could be produced at will by blowing off steam from the locomotive under the wires. It so happened that it was necessary for the locomotive to stop each day at this point to take water; so the position of the wire was changed and the trouble never reappeared.

It seems such an extraordinary kind of a telegraph fault, that our Pennsylvania friend has much difficulty in having his story accepted among the fraternity.

Another case that comes to our notice, where a line was troubled in a similar way, and the lineman sent out to investigate the difficulty got a series of shocks, which corresponded in time to the puffs of a locomotive a short distance away from him, directly under his wires. The steam locomotive not being usually regarded as an electrical apparatus, it seemed extraordinary that it could produce an electrical disturbance on neighboring wires.

We are inclined to believe, however, that both of these stories are correct and that the locomotive is the direct cause of the trouble, in fact it forms a beautiful example of the hydro-electric machine of Lord Armstrong. This is a machine which consists of an iron boiler, containing a fire and mounted on insulated legs. Steam under pressure is generated and allowed to escape through a number of nozzles, in such a manner that the particles of water carried with it are charged with frictional electricity, and collected upon a suitable surface held in proximity to the jets.

By this means very long sparks have been produced and it is capable of giving a very severe shock, in fact its discovery was due to the accidental shock which a workman received who happened to hold one hand in a jet of steam escaping from a boiler and the other hand upon a safety valve, thus forming a circuit of his body, through which the current flowed.

It is not altogether clear that the phenomenon we have been describing might not in some cases be a dangerous one to a certain electrical apparatus. Take the case of a trolley wire under which a locomotive is blowing off steam. Under these circumstances a dangerous spark might be produced in the armature of the central station generator which might result in a short circuit. There are, we believe, no records of such accidents, but wherever a trolley wire is likely to come under such influence we think it is well worthy of investigation.

New Method of Preparing Filaments for Glow Lamps.

The Buda-Pesth Incandescent Lamp Company has introduced some marked modifications in the manufacture of incandescent lamps. The uncarbonized filaments of wood, cotton or other vegetable fiber are first immersed in a bath containing 25 to 30 per cent of potassium silicate, 10 to 15 per cent of gum arabic, and 12 or 13 per cent of caustic soda. After removal they are rolled to the section of an angle iron, which is said to give a strong filament with a considerable superficies. The filaments are then carbonized, after which they are mounted and placed in a bath of melted paraffine or naphthaline. After the latter has become solid by cooling, a current is passed through the filaments, melting and vaporizing the paraffine in their immediate neighborhood, and causing a deposit of carbon, as in ordinary flashing. It will be seen, however, that by this method the carbons can be standardized before being placed in their

bulbs. Liquid paraffine is said not to work, as convection currents are then established in the bath, which bring all the oxygen entangled in the bath in contact with the filaments sparking them. The solution in which the filaments are soaked before carbonizing is said to protect them during carbonization, and to give them a uniform surface, on which carbon can be deposited during the flashing process. The gum arabic is also beneficial, the filaments being stronger after carbonization when it is used. When the resistance of the filaments has been brought to the proper point by the flashing process, they are removed from the bath, and any excess of paraffine or naphthaline sticking to them is washed off with alcohol.

THE bill allowing the Eckington & Soldiers' Home Railway Company, of Washington, D. C., to use horse-power upon its lines awaits the signature of the President. The road asked for the relief on account of the failure of the storage system on the G-street line. The officers say that it is expensive and incompetent, and the weight of the cars is ruining its roadbed. It is probable, however, that the horse-power will only be used on the Capitol Hill extension, as the company will use the trolley where allowed.—*Electrical World*.

ACCORDING to the London *Engineer*, Mr. Danchell, a Danish engineer, claims to be the original inventor of gutta-percha covered wire, which he invented in 1840 to 1845. The first wire used, he says, was in 1847, between Berlin and Frankfurt. Alexander Siemens, in the same journal, claims that Dr. Werner von Siemens was the original inventor, and substantiates his claim by referring to a legal decision in New York, in which the matter was investigated.

Useful Information.

An Adjustable Railroad Whistle.

John Cronin has invented a modification of the calliope whistle that beats the original invention clear out of sight, says the *Truckee Republican*. The original is a clumsy cast affair, with three compartments, and admits of three tones. Because it is cast in one solid piece these three tones cannot be changed, nor can the whistle be removed from the boiler when there is any steam up. If a road wants to adopt a calliope whistle, it must discard all the ordinary whistles and put calliopes in their places. This involves a great expense, but many Eastern roads have made the change. Cronin conceived the idea of changing an ordinary steam whistle into a calliope, and has succeeded so well that he can change any locomotive whistle in 15 minutes to a finer calliope than the original inventor ever listened to. On the inside of a whistle he places a core having four or more metallic flanges which divide the interior into as many compartments as there are flanges. A vertical section of the whistle would now resemble a wheel, the side of the whistle forming the rim or tire, and the flanges looking exactly like the spokes. Cutting pieces of rubber from an old car spring, he fits them carefully into these flanges, but at different depths. For instance, if there are four compartments and the whistle is six inches long, one of the spaces is filled with rubber to within an inch and a half of the mouth. The second compartment is filled to within three inches of the mouth, the third to within four and a half inches, and the fourth is left open or vacant and is six inches deep, or as deep as the bell itself. Screw the whistle into place and turn on the steam. Filling the short compartment first, the one that is only an inch and a half deep, a heavy base sound is emitted. A little more steam sends out an alto from the three-inch space. Open the valve wider, and the four and a half inch gives forth a tenor; and, finally, when the full head of steam gets to work, the six-inch space adds a shrill treble to the quartette, and you have a full-fledged calliope. This is exactly the whistle now in use on the Swing train which runs from Truckee to Reno, for Cronin made it and runs the engine. He also has two of his whistles on the Virginia & Truckee railroad. The whistle of the Swing train was an old mill whistle formerly in use at Virginia, but any whistle can be changed into a calliope by Cronin's method. The train boys had a whistle on the caboose and one on the tender of the Swing train, operated by air from the exhaust of the air-brakes. An ordinary railroad whistle can be changed to a calliope at an expense of less than one dollar. Different tones can be produced by pushing the rubber cushions farther in or out. As many different notes can be obtained as may be

desired, and, by opening the steam valve slowly, each separate note will be sounded, one after another, and finally all of them will sound in unison. Cronin will obtain a patent on his invention, for it does not conflict in any manner with the existing calliope patents. He ought to make a fortune from it. Whenever our readers hear the whistle of the Swing train, let them remember that there is something in it.

To Utilize the Refuse of Towns.

The deposit of sewage and house dust is one of the most important and usually one of the worst managed of the difficulties with which every town has to deal. If the town is fortunate enough to be on the banks of a river, it is almost a certainty that the river will be converted into an open sewer. If there be no river, the refuse will be dumped on some vacant plat, generally in the neighborhood of dwelling houses, and always near enough to affect the health of the inhabitants. The annual estimated amount of "sludge" to a town with a population of 50,000 is, exclusive of surface water, slop water and manufacturers' refuse, over 25,000 tons. The enormous refuse of large towns can now be handled and utilized by the use of the destructor with the greatest ease, to the great benefit of the health of the population and the coffers of the municipality. The refuse is emptied into a number of cells, and by a wave-like motion is gradually moved forward over the furnace. All the moisture and impurities are thus removed and the dry product can be used for a variety of purposes. The temperature of combustion is over 2000 degrees Fahrenheit, and this intense heat, when applied to raising steam or generating electricity, renders sufficient power available to more than repay the cost of both collection and burning. This question is being much discussed in England, where electrical and borough engineers are earnestly canvassing the merits of the latest modifications of the destructor. A company has been formed for contracting to supply electric light derived from the dust refuse of towns. The company claim that 20,000 tons of house dust, if treated as they suggest and burnt in suitable boilers, might be made to produce as much as 56,000,000 indicated horse-power hours, equal to an engine of 1183 indicated horse-power working for 4734 hours, for electric lighting.

PUMICE STONE.—We often hear it remarked, and particularly after the eruption of a volcano, that pumice stone ought to be plentiful and cheap, as quantities must have been ejected during the volcanic disturbance. As a matter of fact, however, none of the white stone in general use is obtained from active volcanoes. It comes from deposits of the article discovered in one or two quarters of the globe, the best of which is at present to be found in the island of Lipari, situate in the Tyrrhenian sea. The island is mountainous in character and consists of tuffa and lavas and highly silicious volcanic products. The district where the stone is found is called Campo Bianco or Monte Petalo (1500 feet above the level of the sea). After riding a considerable distance, partly along precipitous paths sufficiently dangerous to be interesting, and partly through vineyards and over grassy plains, one almost suddenly comes upon a seemingly snow-clad narrow valley, inclosed by hills, also quite white, and the whole glaringly bright on a sunny day. Into these hills workmen are ceaselessly digging deep burrows, working within by candle-light. In their excavations they come across many lumps of pumice stone, which are placed in baskets, subsequently being conveyed along the valley to the seashore, where small boats are loaded and sailed to the seaport near by, where the stone is sorted, packed and shipped to distant parts, either via Messina or Leghorn.—*The Builder & Woodworker*.

WAS THERE AN AGE OF COPPER?—Mons. Berthelot, the well-known technician, in a recent communication to the Academie des Sciences, states his belief in the sometime existence of an age of copper in addition to the three recognized archaeological eras of stone, bronze (copper and tin) and iron. He bases his opinion chiefly upon an analysis of a piece of copper which had been found by Mons. de Sarze in the course of antiquarian investigations in Mesopotamia, or Al Jezira, as the Arabs designate the famous stretch of country between the Euphrates and the Tigris. The fragment thus chemically determined proves to have neither tin nor zinc entering into its composition, there being simply traces of lead and arsenic. Water and the atmosphere had made ravages into the specimen, which was practically a sub-oxide, or a compound of protoxide and metallic copper. As the

ruins from which the piece of metal was taken are authoritatively considered to be more ancient than even those of Babylon, Mons. Berthelot does not hesitate to promulgate the theory that an age of copper preceded the bronze and iron periods, especially as the examination of the component parts of a portion of a metallic scepter which, it is alleged, belonged to a Pharaoh who reigned in Egypt some 3500 years B. C., showed no sign of the presence of tin.

PEAT AS FUEL.—The recent attempts to use peat in smelting iron and under locomotive boilers have been naturally looked upon with great interest in Ireland, which country has practically no coal, while one-seventh of its whole surface, or 3,000,000 acres, consists of peat bog. Dr. Emerson Reynolds, who has given much time to the study of the subject, states that peat compares very unfavorably with coal in many ways. It is five times as bulky as coal, it contains from 15 to 25 per cent of water, and seldom less than 10 per cent of ash, and, bulk for bulk, its thermal value is only one-thirteenth of that of coal. The fresh peat, moreover, contains 35 or 40 per cent of moisture, making necessary considerable expense for drying. During a coal famine some 20 years ago, Dr. Reynolds proposed converting the undried peat into gas, and this was successfully done in the shops of an Irish railway, the efficiency of a ton of peat used in this way for working up scrap iron being 60 per cent of that of a ton of coal used as gas by the same method. Since then the extraction of ammonia from gasified peat makes this process more practicable. A promising new suggestion is that peat shall be used in making water gas, which can be conveniently supplied for domestic and industrial purposes.

Persons receiving this paper marked, are requested to examine its contents, terms of subscription, and give it their own patronage, and as far as practicable, aid in circulating the journal and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber please show the paper to others.

20-Stamp Mill for Sale.

In Southern California, a 20-stamp Gold Quartz Mill, with engine, boiler, self-feeders, rock-breaker, etc. As the premises are adjacent to Railroad, the Mill could be conveniently removed. Can be had at low price for cash. Address "Quartz Mill," care MINING AND SCIENTIFIC PRESS, San Francisco.

Sampling Works for Sale.

The works are situated at Daggett, Cal., in the Calico Mining District, and on side track of the Atlantic & Pacific Railroad. They contain a first-class 50-horsepower engine and 45-horsepower boiler, with Ore-crusher and other machinery, Mill Scales, Assaying Outfit, etc., all nearly new. Also upon the premises an office building and a comfortable dwelling-house (portable). The above can be had at a bargain. Apply to JOHN H. GILLESPIE, 1914 Stockton St., San Francisco.

FOR SALE.

One Ohmen's 12 x 12 Automatic Engine; best style in use. Also, 1 Boiler 48 in. x 16 ft. Both nearly new. Apply to J. W. QUICK, 224 First St., (Top Floor) San Francisco, Cal.

Patent Agency.

ESTABLISHED 1863.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us offer to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 220 Market St. S. F.

KENDALL'S PATENT, AUGUST 24, 1886.

CAPACITY, 12 Tons in 24 Hours. 3 H. P.

MARSHUTZ & CANTRELL, Sole Manufacturers.

The Patentee and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ore in the following particulars:

1. The cost is less than one-half of stamps of same capacity.
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction, We challenge competition with Stamps, Ball Pulverizers or other ore crushing machines now before the public.

Send for Circulars and Price List.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Calaveras.

TUNNEL.—Cor. Calaveras Citizen, March 11: It is reported that Geo. Hengen, of the Hengen mine, has gone to San Francisco upon business connected with his mine at Indian Creek. It is stated that a contract will soon be let to run a tunnel or extend the present one. From all reports the mine is looking well. The lode, though in hard strata, is of splendid quality and well defined in richness. No doubt there is a good mine there.

DISCOVERY.—Daniel Thompson reports that his brother has recently discovered a vein of ore existing upon his ranch a short distance north of Murphy. The old gentlemen claim that the rock contains not only gold but silver also in quantities that is flattering. It is reported furthermore that several years ago some one found a good paying lode upon the land above named, but knowing it to be claimed and patented he desisted from any further investigation.

AROUND MURPHY.—Cor. Calaveras Citizen, March 11: On the "Enchantress," N. E. of the Oro Minto shaft, there is a shaft down 100 feet on the two-foot vein of excellent quality. At this depth levels have been run 55 feet N. E. and 138 S. W. of the shaft. The average pay per ton of ore worked in the company's mill—burned down some years ago—was \$20 per ton, free milling; 2000 tons were worked. The tailings were stopped in a large reservoir built for the purpose, and a recent run of several tons brought \$7 per ton, and, besides gold, containing silver, lead and antimony. It is estimated that there is thus confined over 2000 tons of these tellings, and with the various dumps in proximity from which quartz could be selected, would keep a five-stamp mill running several years with profit. In close proximity of the Calaveras property is the Washington and Right Power on the north end the Fenien, owned by the Oro Plata Co., and the Fricot property on the west, and other mines convenient for a milling proposition. On the dumps of all these mines are tons of quartz of good quality. A company had been formed to work the tellings of the Calaveras Co.'s mines and the dumps and arrangements were made with the owners to do so, but were disappointed by a change in the arrangements of the disposition of the Washington mill, and lately by the contemplated opening of the Oro Minto by Mr. Horswell & Co. It is believed by those conversant with this district and have a practical knowledge of mining that capital alone is all that is needed to make this favored mineral region team with life and prove highly remunerative to the owners of mining property in the district. The reopening of the Calaveras group of mines on Indian creek will mark an era in mining enterprises in the Washington district that will be successful and lasting. The property has recently come into the possession of Mr. J. S. Horswell & Co., who will continue developments on the 400-foot level of the "Oro Minto" as soon as roads will permit the hauling of lumber and machinery on the premises. Mr. Horswell is an experienced miner and is engaged in mining enterprises elsewhere. He, in company with Frank Marshall, who has an intimate acquaintance with the property for years, looked over the property recently to determine the nature of necessary work preparatory to resuming operation. It is well known among miners who have worked in the lowest depths of the mine that work was directed there contrary to the judgment of some of them, and that, in their belief, the large body of ore—three to seven feet wide—lying westerly of main shaft will prove to be remunerative. There is another shaft on the "Oro Minto," 325 feet deep.

STARTED UP.—Calaveras Chronicle, March 11: The Good Hope Mining Co., whose claim is situated on the Mokelumne river, about a mile and a half from this place, has again resumed active operations. A contract has been let to run a tunnel into the old "Pink Smith" mine, which is now owned by the Good Hope Co., and in which there is good ore known to exist. Mr. J. H. Jacobs, of this place, is superintendent of the company.

Inyo.

JUST SO.—Inyo Index, March 11: A New York mining expert, who recently visited Owens valley and inspected mines in the adjacent Inyo range, was well pleased with the mines, but says the transportation facilities here are much against the mining interest. He further said that it would be very difficult to get people into this section until we had shorter rail communication; that when a man got to Belleville, he was ready to turn around and go back.

A BIO DEEN.—A transfer has just been put on record from A. L. Tubbs, assignee of the Harmony Borex Co., Meridian Borex Co. and California Chemical Co., to F. M. Smith for a large body of patented borex lands in South-eastern Inyo, the consideration being \$150,000. The deed covers 111 pages of county records.

Nevada.

STEEL HOLLOW.—Nevada Herald, March 10: About a year ago an item appeared in the Herald describing the Steel Hollow mines. A full description was then given of Jno. Hussey's quartz claim, the Grand Victory, and it was predicted that this mine would in the future be valuable. Time has proven that such is the case. This discovery will perhaps lead to important mining developments in the once-famous Remington Hill mining district. In days gone by, many rare nuggets were found in

the vicinity of Steel Hollow. In 1864, James Green found a nugget at Remington Hill valued at \$7000, and at various times nuggets were found valued at \$2500. In 1876, a Chilean named Pete Castro worked in Tiger Ravine, now owned by John Hussey, and situated within his mining claim. Before going to his native country, Chili, he showed a friend a double handful of quartz nuggets. This fact would tend to prove that Mr. Hussey has the ledge from which they came, and that there are many more nuggets in his claim. This mining section, like many others, was affected by the closing down of the hydraulic mines; but since, quartz and drift developments have proven it to be a rich mining district. Directly opposite to the Grand Victory are the Harrison and the Pioneer Steel Hollow placer mining claims, belonging to W. O. Gray and John F. Coe. Two large tunnels have been run into these claims, and enough work has been done to demonstrate that they are good mines. The owners undoubtedly have a rich channel, for some valuable nuggets have been found by them. The gravel is blue and easily worked, no crushing being necessary. The extension of the Harrison claim is owned by Venice, Greeley and Beightol, and it is also a good mine, as has been proven by quite extensive developments. Another proof of the value of the claims above mentioned is the fact that, in early days, Steel Hollow paid thousands of dollars up to these mines, but it never paid much beyond them.

GRASS VALLEY "PROSPECTS."—Telegraph, March 10: The regular monthly meeting of the directors of the St. John mine will be held next Saturday evening. The mine is looking very favorable. Sinking from the 300 level will be commenced shortly. The Baltic will soon place an errestre on its ground for reducing the ore. The directors are of the opinion that the ore can be worked to much better advantage by this process than by milling. Some very rich rock is being taken from this mine. The Wyoming will hold its annual meeting for the election of officers Saturday evening. Active work will shortly be commenced on this mining property. Mr. Joseph Everett has been awarded the contract of moving the old hoisting works of the Green Mountain to the new shaft. The South Idaho Company has its new patent steel whim in operation. It does excellent work, and is attracting much attention from mining men of this locality.

RICH QUARTZ IN THE MAYFLOWER.—Gress Valley Union, March 15: A remarkably rich shoot of quartz has recently been struck in the Mayflower mine at Canada Hill, and the rock that is being taken out excels anything found in this section for a long time. The ledge is about a foot wide and the ore will yield several hundred dollars per ton. How extensive the shoot remains to be seen. It was struck while making an upraise, and at present is pitching toward the surface. It may not last long, or it is possible that the ledge breaks before reaching the surface and takes a downward pitch, in which case it will probably prove very extensive. The rock taken from the mine will average, just as it comes, \$60 per ton. Although the mine has been worked for a number of years by tunnels and shafts, no great depth has ever been attained. The incline through which the company is now working is very flat, and the point where the rich shoot was encountered is probably not over 40 feet below the surface.

SUPERINTENDENT RASIONAL.—Grass Valley Telegraph, March 10: On Saturday evening Thos. H. Moore, who has been the superintendent of the St. Johns mine, resigned his position and Lewis Wheeler was appointed in his place. Mr. Wheeler has had a large experience in mining and will push the work forward. A dump is being sunk in the lower level, and as soon as that is completed the work of sinking the shaft still further will be commenced.

Mono.

MILL STARTED.—Bodie Miner, March 10: The Bodie mill started up Wednesday on ore from the Bulwer mine, with prospects of a long run. There is a large quantity of ore on hand and a lot more to be taken out.

BODIE CON.—During the past week east crosscut, 550-foot level, was extended eight feet. Upraise, 200-foot level, was extended 20 feet. South drift from west crosscut, 200 foot level, Lent shaft, was extended 26 feet. There were employed 5 miners, 1 carmen, and jointly with Mono 1 engineer, 1 blacksmith, 1 watchman, 1 foreman.

MONO.—During the past week east crosscut from main south drift, 550-foot level, was extended 15 feet. West crosscut from same drift was extended 10 feet.

Placer.

IOWA HILL.—Pleaser Herald, March 11: We learn from Mr. Bonham of Iowa Hill, who was in Anbaru this week, that times at the Hill are pretty good, and that the passage of the Cennett mining bill encourages the people of that part of the county to hope they will be better before they are worse. The Morning Star and the Big Dipper (formerly Hormen) drift mines are both running steadily and both paying well, and between them are giving employment to about 70 men. Spies have been pretty thick around the Hill lately, but of course they found nothing to report on that is contrary to what ought to be. They are generally well heeled, and, not being very good poker players, the boys in the mines are getting so that they like to see them come around. In fact, the opinion is spreading that the more flush spies the valley people can send into the mountains, the better for mountain people.

Siskiyou.

BLUE GRAVEL CO.—Yreka Journal, March 8: The Greenho N Blue Gravel Mining Company has been reorganized, and the claim will be under the management of Tim Anstin, an ex-

perienced miner from Scott River, who has means to go ahead with the work in a systematic manner. The shafts and tunnels will be timbered up in the most scientific style, and a number of superior miners have been engaged, with the expectation of hoisting pay gravel within another week's time. This claim, formerly known as the Lee, Lash & Co. mine, is one of the best in the county, but requires working on an extensive scale and in a most thorough manner to elevate the rich blue gravel lying on the bedrock 100 feet down, as there is a great amount of water to contend with, requiring steady use of the steam-pumping machinery for drainage. J. S. Spencer, Kingsbury, Mullen & Co. are still opening up the new quartz ledge in the Siskiyou foothills, near Cole's, just this side of the Oregon line, and have undoubtedly a very rich ledge. Several other locations in the same vicinity are also turning out well, and will be worked on an extensive scale as soon as the snow melts away to get around easier on the surface. Mr. Howell of the San Francisco Company, working a quartz mine near forks of Humboldt, is in the county inspecting the work in progress under the supervision of Mr. Hunt. The miners are sinking down another prospecting shaft, and, as soon as sufficient good-paying quartz is taken out, the mill will be started up for crushing.

Tuolumne.

WORK PUSHED.—Tuolumne Independent, Mar. 11: The Cook, Gloster & Ryan quartz mine is situated one-half mile below the New Albany. The shaft is 40 feet deep, and the vein averages four feet wide. Free gold is seen in the rock, and it assays \$2000 per ton. It is evidently the richest milling vein in the county, and work is being rapidly pushed to prove that there is no mistake about it.

QUARTZ.—Tom Heles and Ches. Richards have discontinued work on their quartz mine in the Mrs. McQuade field. The boys were well deserving of a bonanza for the perseverance and energy manifested in the labor of sinking an incline 60 feet, in hard ground, and running levels therefrom. There may be thousands in value of the precious stuff but a few feet from where they did their last work. Yet this is a measure of unknown quantity. Thus, like many more mining enterprises commenced in the county, they go under by reason of a lack of capital to continue work.

REDUCTION WORKS.—Mr. L. Mason is running his reduction works in full blast. Oscar Bleir is looking after the roasting department, while Mr. Mason attends to the chemicals and process of chlorinating and separating the gold. Teams pass daily loaded with ore that is being conveyed to the works for reduction. Thus, the outlook for the Sonora Reduction Works the coming season is encouraging.

MINING IN TOWN.—G. L. Mead, who is mining the Masonic lot, corner Broadway and Washington streets, Columbia, has struck a rich sink, adjoining the brick building—or rather, two sinks separated by a small stream. One, probably the largest, pitches under the building; the other, toward the stable lot, in the direction of the Water Co.'s office. Mr. M. washed up on Friday last week, after 28 days' work, using water 18 days, and took out 55 ounces, about \$1000. He also gathered about a handful of coins of almost every description—copper, silver and gold—the mintage of various countries. Among the collection were a \$5 coin of 1838; half-dollar of 1807, now worth \$3.75; a dime of 1843, now worth 60 cents. The labor is performed by Mr. Mead and a hired man, and the result shows an average pay of \$18 per day to the man. The prospects are for better yet. We would like to congratulate him, but he don't need it—coin talks.

NEVADA.

Washoe District.

CON. CAL & VA. MINA.—Virginia Chronicle, Mar. 11: 1500 level.—Have continued to extract ore and old fillings in working upward in the old south stope, from the 10th to the 14th floors above the sill floor of this level. 1550 level.—Have continued making necessary repairs to the drift on the sill floor of this level. We continue to extract some ore from the old stope, eight floors up in the upraise No. 6 carried up from the main northwest drift; also from the old stope in working north from the crosscut run west from the northwest drift. The north drift started 150 feet in from the northwest drift has been advanced 11 feet; total length, 45 feet; in a porphyry end quartz formation of a very low assay value. At a point 52 feet down in the winze started in the west crosscut a south drift has been advanced 28 feet in a porphyry and quartz formation of very low assay value. Have extracted during the week from the 1500 level stope and 1650 northwest drift openings and raised to the surface 545 cars of ore, about 540 tons. Shipped to Morgan mill 223 1310-2000 tons of ore. Average assay value, per railroad car samples, \$29.13. The Morgan mill will commence to work this ore on Monday next. Bullion shipped to Cerson Mint, assay value \$23,351.96.

OPHIR.—500 level.—Jointly with Mexican Co. are doing some necessary repair work in the west drift from the shaft through which the water flows that drains the upper portion of the mine. The water from this level is conveyed through pressure pipes to the 1465 level and with the use of water-wheels we get power to drive our ventilating blowers and fans. 1465 level.—We have the hoisting machinery in place at the head of the upraise and cages in operation through the upraise to the 1565 level. Will commence sinking the winze from the bottom of the upraise on Monday of the coming week.

MEXICAN.—On the 1465 level.—West crosscut No. 2 from the north drift from the east crosscut from the bottom of the winze has been ex-

tended 14 feet; total length, 31 feet, continuing in porphyry formation showing clay slips. Jointly with the Ophir Co. on the 500 level from the Ophir shaft are doing some necessary repair work, to keep a regular flow of water running to the shaft, from which we get power to drive water-wheels that run our ventilating fans on the 1465 level.

UTAH.—340 level.—The south drift from the main west drift at a point 595 feet in from the shaft has been extended 22 feet; total length, 165 feet; continuing in porphyry, clay and quartz formation.

SIERRA NEVADA.—Have completed repairs to intermediate tunnel and resumed work in The joint Sierra Nevada and Union west drift, 900 level, has been advanced during the week 24 feet, making the total distance west of the joint shaft 3000 feet; the face is in porphyry.

UNION SHAFT.—The joint Sierra Nevada and Union west drift, 900 level, has been advanced during the week 24 feet, making the total distance west of the shaft 3000 feet; the face is in porphyry.

ANDRES.—On 420 level north drift from east crosscut No. 1 north advanced 15 feet; total length, 146 feet.

GOLDEN & CUAAY.—200 level.—During the past week, crosscut No. 5 started in northwest drift, 432 feet from main west drift, has been advanced 19 feet, passing through porphyry and seams of clay; total length, 366 feet. Sinto tunnel level.—The joint east crosscut with Best & Belcher Company has been extended 19 feet; total length 61 feet; face in porphyry.

BEST & BELCHER.—200 level.—West crosscut No. 1, started in northwest drift, 170 feet from our south line, has been extended 18 feet, passing through quartz and porphyry giving low assays; total length 114 feet. 900 level.—West crosscut No. 3, from top of upraise No. 1, from 1000 level, has been extended 8 feet; total length 166 feet; face in hard porphyry. Work in this drift has been discontinued. The joint east crosscut with Gold & Curry Company has been advanced 19 feet, passing through porphyry; total length, 61 feet.

HALE & NOACAOS.—We have put in new guides in the south compartment of the main shaft down to the 1100 level and are now repairing the shaft below this level, to allow the cage to run to the 1300 level while new guides are being put in place in the north hoisting compartment. Main Incline.—We continue making the necessary repairs. 1400 level.—Are retimbering the main north drift on this level. 1800 level.—West crosscut No. 1 from the main south drift was advanced 18 feet; total length, 183 feet; face in quartz and porphyry. West crosscut No. 4 from main north drift was advanced 18 feet; total length 230 feet; face in porphyry. The north prospecting drift from end of west crosscut No. 3 was advanced 20 feet; total length, 25 feet; face in quartz and porphyry.

CHOLLAA.—The north drift from the south line, 550 level, is out 243 feet; face is in quartz that assays from \$6 to \$12 per ton. Are repairing the upraise above the 450 level and retimbering the two north compartments of the main shaft above 930 level. The east crosscut 260 feet south of the north line, 930 level, is out 40 feet; face is in porphyry.

POTOSI.—Are repairing east crosscut 350 feet south of north line, 850 level. The east crosscut opposite Potosi winze, 930 level, is out 296 feet; face is in hard porphyry. The west crosscut from south drift, 260 feet east of Potosi winze, 930 level, is out 28 feet; face is in soft porphyry. The north drift, 260 feet east of Potosi winze, 930 level, is out 24 feet; the last ten feet show a 12-inch streak of quartz with bunches of good ore throughout it. The north drift from top of raise, 1000 level, is out 170 feet; face is mostly quartz that assays from \$7 to \$12. The south drift from top of raise, 1000 level, is out 243 feet; face is in soft porphyry. No work has been done on the 1800 level the past week on account of retimbering the West shaft. Extracted and sent to mill the past week 424 tons and 750 pounds of ore from the 550, 930 and 1150 levels. Milled during the week 430 tons; on hand at mill, 134 tons and 500 pounds. Average battery assays, \$24.54. Average car sample assays, \$26.39. Shipped to U. S. Mint, Carson, 525 pounds of crude bullion.

NEW YORK.—Have been grading and timbering incline winze below the 650 level. The west crosscut, from the southwest drift, 850 level, is out 90 feet; face is in low-grade quartz and porphyry.

SILVER HILL.—The southeast drift, 450 level, has been advanced 5 feet, through hard porphyry; total distance from north line, 67 feet.

ALPHA.—No work has been done on the 1800 level during the week, on account of timbering the Ward shaft.

EXCHAUQUE.—No work has been done on the 1800 level of the Ward shaft during the week, on account of timbering the Ward shaft.

WARD SHAFT.—Had to stop prospecting work on the 1800 level the first part of the week to retimber the shaft, 1000 feet below the surface.

KANTUCK.—160 level.—We continue to extract from two to three tons of ore per day of the average value of \$30 per ton as per car samples. The south drift from the Jacket east crosscut on 1100 level is in 170 feet. The face is in fair-grade ore.

OCCIDENTAL.—The main north drift on 750 level has been extended 15 feet; total distance from winze station 674 feet; the face is in fair-grade ore. No. 2 winze from south drift, 750 level, is down 12 feet; bottom in low-grade ore. The Zadir drift, Sinto tunnel level, has been extended 14 feet; total length, 863 feet; the face is in hard porphyry.

Tuscarora District.

NAVAJO.—Times-Review, March 10: The stope above the 350-foot level are looking

about the same. Have started a slope at the south end of the old works on the 150-foot level.

BELLE ISLA.—Line drift, 250-foot level, extended 15 feet; rock getting softer. The stopes above this level are yielding about the same.

NORTH BELLA ISLA.—The stopes above the south 300-foot level are looking about the same. Have discontinued the north 300 stopes.

Ferguson District.

RICH FIND.—Pioche Record, March 9: A rich find is reported from a claim of Cassidy & Conaway, lying north of the Hunter claim, a mile north of Helena, in Ferguson district. A sample brought to town indicates an iron gangue, while metallic silver can be plainly seen throughout the piece, which is stated to assay \$7000 a ton. The extent of the ore deposit or ledge is not given.

Yellow Pine District.

KAYSTONA.—Pioche Record, March 9: A. Werner returned last Saturday from a two months' trip to Yellow Pine district, where he went to look after mining interests of his. The most promising claim of which he reports, outside of the Keystone, is the Clementina, on which he did some surface prospecting and also sunk a 12-foot shaft. The shaft is sunk on a hold outcrop of honey-combed iron, showing a ledge averaging three feet in width with an ore seam of from 15 to 20 inches. Several assays were made from this seam, ranging from \$125 to \$540 in gold per ton. The ore in color resembles that of the Keystone claim. We erroneously stated heretofore that the Clementina adjoined the Keystone; such is not the case, however. It is some 800 feet farther up the hill and on a separate ledge, which from the formation thereabouts strengthens the general belief that the claim will prove most valuable. Several chunks of ore from the claim are to be seen about town. The district in general is quiet just now, four men only being employed at the Keystone. The quarter interest in the claim held by C. O. Perry has just been purchased by I. C. Blake, of Denver, for \$20,000, and active work on the mine may be resumed at any time. Mr. Blake is the moving spirit in the Nevada Southern railway, building from Goffs to Yellow Pine, and is a desirable man to have interested. The half interest owned by Jos. Taylor, the locator of the claim, is also bonded, and if new parties take hold of this interest the mine will be worked vigorously from the start.

Central District.

A MILL.—Silver State, March 6: The Blackbird mine in Central district, which was purchased last week by F. W. Dunn and S. S. Robinson, will, in a short time, become a producing property. The owners have bought a mill at Galena, Lander county, which will be torn down and removed to Central. E. M. Fellows of this place will superintend the work, and a force of men will be sent to Galena to-day to dismantle the mill. A number of buildings will also be removed from Dun Glen to Central. The owners of the Blackbird have one of the richest mines in the State and mean business. In a very short time, shipments of the yellow metal from Central will be in order.

Pioche District.

AT BULLIONVILLE.—Pioche Record, Mar. 9: The operations of the Bullionville Mining and Reduction Co., promising as they do to continue for many years on the material known to be on hand and ready for treatment, in which respect they differ from the ordinary mining operation, are of general interest. The work of the past few months has demonstrated the practicability of profitably working the immense beds of tallings there, and the work is to be facilitated by the addition of more leaching tanks. Six new tanks of 60 tons capacity each have just been ordered from San Francisco. These will replace eight of the present ten-ton tanks, so that the leaching capacity will be raised to 300 tons for the six large tanks as above, and 60 tons for the six small tanks which will be retained, making a total of 360 tons capacity, as against 140 as now. By giving six days in which to run through a charge of ore, there will be five charges per month, equaling 1800 tons, or 60 tons per day. With such ample facilities for time in leaching, a weak hyposulphite solution will be used, by means of which the silver will be extracted, and the bases for the most part left unaffected. The sulphides, moreover, will assay up in the thousands, and altogether yield a much higher profit than has been possible under the former treatment. To meet this increased demand, in addition to the large Howell furnace, which can chloridize 50 tons of sands per day, a new reverberatory furnace has just been completed, which will chloridize from 10 to 15 tons of elimes per day. From what has already been done, no doubt is entertained that the chlorination from the Howell furnace will reach at least 75 per cent, while those from the reverberatory will be considerably higher. The only thing now needed to enable this large quantity of roasted pulp to be handled with ease and economy is additional cooling floor, and for this adequate provision is being made by utilizing the old slag dump adjoining the reduction works on the east. The new leaching tanks will be 15 feet in diameter by ten in height, and will be loaded automatically by means of a chain elevator, which will take the roasted pulp direct from the cooling floor. The reduction in cost of treatment which will result from these improvements will be about one-third, while the gain in extraction in silver and gold will doubtless be as much more. Already the mill is running steadily and turning out sulphides in good quantity, despite the disadvantages under which the company is laboring, the net results of which have abundantly demonstrated the stability of the enterprise and bode well for the early future large and continuous profits,

even at the present low price of silver, something, by the way, which we regret to say does not apply to the generality of our mines hereabouts. Altogether, the outlook for Bullionville is more than promising, since something like adequate compensation for the time, labor and money spent on this enterprise is now absolutely assured, and it is pleasing to note that the indomitable will, energy, pluck and dogged perseverance of W. S. Godbe, who has already done so much for this section, and who appears never discouraged, no matter what difficulties may present, are to be thanked for the success of the enterprise.

ARIZONA.

DOS CABEZOS.—Tombstone Epitaph, March 8: The Silver Cave Mine in Dos Cabezas, on the extreme west end of the mineral belt, is now a competitor the honor of being one of the big mines of the district. The Silver Cave is one of the oldest mines in the district and belongs to S. R. Delong. A large amount of work has been done upon it and an immense ledge of moderate-grade ore has been developed. In 1885 a shaft was sunk on the side down the hill, or south side of the big ledge. Instead of sinking it straight the man who had the contract put it down on an incline, for the reason that it was easier working. About ten days ago Mr. Delong thought he would put the shaft down about 50 feet deeper, and placed two men at work to straighten the shaft. In this work a streak of ore was encountered, which widened as work progressed, and at the bottom of the shaft there is a ledge 20 inches wide which assays \$208 gold per ton. How wide this is Mr. Delong does not know, but a crosscut will be run at once to determine it. The shaft had originally been put down within a few feet of this vein and had been running away from it as depth was attained. Mr. Delong had some of the rock with him to-day. A proposition is on foot to start the Philadelphia 15-stamp mill, which has been idle for several years. This mill is located in the town of Dos Cabezas, and is fitted with pans and concentrators.

LUCKY CUSS.—The shaft or winze below water level in the Lucky Cuss is down 200 feet. It will be sunk 20 feet further before prospecting is commenced. A station will be put in at the 200, the 20 feet of shaft below it being used as a sump in case of a flow of water being encountered in prospecting.

NORAS.—Mojave Miner, March 10: The El Dorado canyon mill is running steadily on ore from the Mocking Bird and other mines owned by the Southwest Company at that place. The strike on the 300-foot level of the G. A. R. mine at White Hills still continues to produce ore of extreme richness. The company feels jubilant. Ed. Gilbert and partner are at work on the Cupel mine, Stockton Hill, and are getting good ore. They will make another carload shipment next month. The Chloride smelter is waiting for coke, which, owing to the heavy rains of the past week, has been laying here awaiting transportation to the smelting works. A carload of gold ore was received at the Kingman camp from Wm. Grant, Hackberry, the first of the week. The ore is high-grade gold rock from a Music mountain mine and goes away up. Dan Shean and three other gentlemen of White Hills have leased a portion of the Prince Albert ground and have a contract to sink the shaft, formerly worked by Blaine and Phenix, 50 feet deeper. The Diamond Joe has been a good producer of high-grade ore since its discovery, and the gentlemen have one of the bonanzas of this section. With proper management this mine will undoubtedly make a record for itself. Jas. Uncapher, Chas. Gross, Jr., and Jose Canyas left Sunday for an extended prospecting trip through the southern portion of the county. Their field will be in the vicinity of old Greenwood on the Big Sandy. Ed. Phenix and Geo. Blaine have completed their contract on the Prince Albert ground at White Hills and have commenced operations on a claim owned by them between the G. A. R. and the Prince Albert. They have a good showing to begin on and will undoubtedly make a good stake out of their property, as they are both energetic workers and practical mining men of long experience. C. W. Barry and R. M. Kennedy, of Denver, Colo., have obtained control of the Diamond Joe mine in Cedar district. The terms of the contract are about as follows: The parties have the property leased for nine months and pay the owners, P. E. Collings, Russell & Ziener, Jesse Orozco and the Martinez Bros., 25 per cent royalty on new workings and 30 per cent on the old workings. If at the end of six months these gentlemen deem it advisable, they will pay \$25,000 for the property outright. If not, they will work it three months longer and then agree to pay the owners \$27,000.

MONTANA.

THE FLINT CREEK MINING DISTRICT.—Phillipsburg Mail, March 11: Regardless of the paltry price now being paid for silver, we find throughout the hill many prospects under way of development, and good shipping ore is being extracted from some of them. There is no question but that the mining industry will continue to multiply in this section while silver can be sold at anything like what it is worth, and should the white metal receive a knock-out blow in Congress, under the new administration, the mines of this district would be the last in the State to stop operations. The location of Phillipsburg, the county seat of Granite county, makes it a natural center for a vast section of rich country from every point of the compass, and there is a production of more than metals to warrant its permanency. The beautiful Flint Creek valley has already enriched scores of ranchers, and each year the production from its lands becomes greater and new tracts are being constantly improved for agricultural purposes. The lumbering industry is carried on to quite an extent, and there is opportunity for greater operations of this kind, as

the vast forests of beautiful pine and fir may well be termed inexhaustible. No estimate can be placed upon the riches that may yet come from the unprospected fields, or at least those that have only been run over by the tourist prospector. Each year exceeds its predecessor in rich finds, and while many fortune-seekers can only imagine wealth in some far-off land, those who remained at home and prospected where mineral was known to exist have usually reaped a harvest of the much-sought treasure.

THE GRANITE MOUNTAIN.—The Granite Mountain Co. has lately been credited with a rich strike in the Granite-Rimsey tunnel, but the local management of the company has given out that there was no truth whatever in the report. The report of the tunnel strike must have gained circulation, however, from the report sent to the company's home office, giving particulars of the discovery of 18 inches of 1158-ounce ore in the seventeenth level east, where, it is said, the greatest deposits yet unvelled in the Granite mine are being exposed.

OREGON.

PIPING TIMES OF PROFIT.—Rogue River Courier, March 16: H. M. Chapin came in from the Poorman place, on Grave creek, Monday. He has been piping contently of late and has good prospects of a profitable cleanup. He says there are no less than nine sets of pipes and monitors on lower Grave Creek (below the railroad) all singing merrily as they wash Josephine hillsides into the ravine and start the "slickens" on its way to the mouth of Rogue river.

WILLIAMS CREEK.—The neighborhood of Williams Creek is becoming famous for the frequency and value of its quartz ledges. Several mills have been erected recently and these will start grinding ore when the roads dry off sufficiently to allow hauling from the tunnels to the mills.

SILVER DISCOVERY.—H. B. Slater, one of our pioneer mining men, informs us that a 12-foot vein of native silver has been found in tunnel eight. The find is the property of Sol Abraham, who will visit the point shortly with engineers to determine the course of the vein with a view to tapping the ore at the surface of the hill. Mr. Abraham owns three 40-acre tracts adjacent and the lode has been traced through each tract, but it goes no farther. Piles of silver ore can be found along the railroad, where it had been dumped by the tunnel-diggers, who had no idea what valuable stuff they were handling. It is considered lucky that Sol Abraham has become possessed of the ledge, as it will take considerable wealth to develop it.

SOUTH DAKOTA.

COPPER ORES.—Deadwood Pioneer, March 8: As spring approaches, there is a good deal of talk about certain rich copper locations on Box Elder, and it is quite likely that some extensive development work will be done on some of them during the coming summer. It has long been known that rich copper ore could be found in this region, but very little work has been expended in trying to find an ore-body of large enough proportions to work at a profit. As the outcroppings are unusually large, it is not likely that it would take any extraordinary sum to develop a mine.

CARACONATA FLUME ANNUAL.—At the annual meeting of the Carbonate Flume Company, held yesterday, the following officers and directors were elected for the ensuing year: Wm. Lander, Pres.; T. H. Russell, Vice-Pres.; W. S. Elder, Sec'y and Treas.; R. N. Ogden, V. T. McGillicuddy. The company owns a fine water-right, mill-sites, placer ground, etc., on Spearfish creek.

CUSTER PAKE.—A great deal of work is at present being done in the Custer Peak mining district. A shaft is down on the St. John property over 100 feet, and a crosscut of 50 feet has been made, which discloses the fact that the vein is a large one. The gold ore, which is free-milling, goes from \$7 to \$35 per ton. A two-stamp mill was erected on the property last fall, but was unable to run on account of the severe weather. It was started up a couple of weeks ago, and a cleanup will be made this week. The owners state that if the cleanup is satisfactory, they will erect a 20-stamp mill during the coming summer.

IMOGENA PROPERTY.—Development work on the Imogene property, near Perry, is progressing satisfactorily, and three vertical veins of free-milling gold ore are now being exposed in excellent shape. The ore goes \$5 per ton, pan test, and the property is likely to become an important bullion-producer at no very distant date.

UTAH.

THE SAN JUAN PLACERS.—S. F. Examiner, March 8: Gen. W. J. Palmer, president of the Rio Grande Western Railroad and a prominent figure in Western railway circles, has come over from Salt Lake City on a brief visit to this city and Los Angeles. The General recently sent F. Greene, an exploring engineer and a member of his official staff, to make an investigation into the recent gold-mining excitement in the San Juan country in Southern Utah. Mr. Greene has lately made a report to him, and in talking about it yesterday he said: "Mr. Greene has reported to me that the excitement of last December and January over the San Juan gold placers was a false alarm. He found on personal investigation that gold did not exist in paying quantities, the story having been made out of whole cloth. According to his report, it appears that there is a small amount of fine gold in the San Juan river, on the banks on either side of it and in the strata of clay which run through the sandstone formation. This gold has been known to exist for years, having been prospected for by miners as long as 30 years ago; but it is of such a character and of such fineness that no ordinary

process will save it. In panning or using a rocker, it is so light that considerable of it escapes before the black sand is washed off. Men working with either process could not possibly make sufficient for the purchase of ordinary supplies, aside from wages. While on his tour of investigation, Mr. Greene and his party examined the gravel bars on the Colorado river for a distance of 40 miles in a boat down the river. He started from North Wash, four miles above Dandy Crossing. Thirty-two bars were investigated, and he personally panned out gravel on a number of them. In no case was there a barren pan, the least number of colors to a pan running from 40 to 50, and as high as 150 colors. He says the gold is quite fine, but that there should be no difficulty in leaving it. He estimates that the different bars run from an average of 25 cents to 75 cents a cubic yard. He instances the case of two men who are now working on the California bar on a portion of it where the gold is finer than the average. He says these men are making wages, though using a crude rocker and having to handle the gravel three times. They have taken out in the regular course of their work \$10.50 from seven cubic yards of gravel. Mr. Greene in detail then reports that the placers continue down the river for a distance of a hundred miles, the gravel being very regular in size, and there being no boulders of a weight but what one man could easily remove them. He approximately cubed the contents of the 32 bars he investigated, and found that they contained about 100,000,000 cubic yards, which, at an average value of 35 cents per cubic yard, would result in a money value of \$35,000,000. He thinks the source of the gold on the Colorado river is from the Henry mountains, and he also noted that the gold appeared to be equally or evenly distributed throughout the gravel, as there seemed to be but little difference in value whether tests were taken from close to the surface, midway down or close to the bedrock. He was informed that working tests gave the same results. Mr. Greene did not visit the Henry mountains, but he says it is reported that there are 2000 acres of unusually rich placer gravel on their east slope—gravel which will run from \$1 to \$12 per cubic yard. The difficulty there has been a lack of water, and the gravel has been worked by the dry process. He thinks this spot will become an active scene of operations in the spring, for quite a number of men have already gone there. Other men, he says, who intended going into the San Juan country are now waiting at Green river for the cold weather to pass by in order to get into the Henry mountains."

THE RAP ROSA MINE.—Salt Lake Mining Journal, March 10: From time to time the Journal has made mention of the work being done in the Red Rose mine at Silver City, Tintic. It has been known for some time that a big strike had been made in this property, but Will Groesbeck, the manager, has been very reticent on the subject. Through one of its various channels of information, however, the Journal has been enabled to glean some authentic news, as follows: Early yesterday morning air connections were made with the main shaft through the old tunnel. In the drift, 400 feet from the shaft, a four-foot body of ore was cut that runs over 100 ounces in silver and \$10 to the ton in gold. Twenty-five feet farther another body of similar ore was encountered. This body was crosscut for about 15 feet, when a horse blocked the way. Cutting through this, ore was again found through which the drift was run for 20 feet without striking the hanging wall. This is an immense body of high-grade ore, the extent of which cannot be ascertained without doing a large amount of development work. One shift is now employed in taking out ore from the first strike. By Sunday or Monday air pipes will be put in and air connection made, when night and day shifts will be put on and regular ore shipment will begin. The Red Rose is destined to become a great producer.

THE PARK CITY SAMPLER BURNED.—A fire originated in the boiler-room of the Park City sampler yesterday afternoon. In the absence of water the entire building and its contents were destroyed. Five cars loaded with ore, standing on an adjacent sidetrack, were also consumed. The loss is estimated at about \$25,000, with insurance of from \$14,000 to \$15,000. Mr. Mackintosh went up to the Park this morning, and will make arrangements to put up a larger and better plant immediately.

SITUATION AT THE BACK.—A telegram from Eureka states that the Bullion-Beck mine started up yesterday with a force variously estimated at from 30 to 50 men. It is learned since that but 16 men went to work, six of whom were old employees. The Union posted them as scabs and prevailed upon three to quit in the evening.

Market Reports.

The Markets.

SAN FRANCISCO, March 16, 1893.

A dispatch from Washington says that Senator Teller has prepared resolutions expressing the sense of the Senate in favor of re-convening the International Monetary Conference at Brussels next summer. Teller says he is satisfied that there has been a change of sentiment in Europe regarding the monetary question since the conference adjourned. It is plain to him that the delegates from European countries began the conference under an erroneous impression as to the policy of the United States. Lately it has been made clear that the purpose of this country was not primarily to reap the benefit of the enhanced price of silver. Recent contributions to the literature on the subject, notably an article published by Professor Andrews, have made it appear that the value of the entire annual silver product is absolutely insignificant as compared with the value of the products in certain lines of manufactures and agriculture.

Along with this statement of Senator Teller's intentions comes a dispatch that Secretary Carlisle will "exercise all the power and discretion invested in him to uphold the credit of the Government and maintain the parity of gold and silver." This statement was made to brush away the rumors about what he contemplated doing, as to issuing bonds or as to paying United States notes or United States Treasury notes in silver when the free gold was exhausted, etc. But here is the Secretary's scheme for maintaining the parity of the metals, according to later advices:

"Secretary Carlisle expects to have ready to present some financial propositions by the time Congress meets which will form a basis of agreement between Congress and the Executive on the vexed financial problem. The men who have talked with him on the subject say that he has a plan well outlined in his mind which will involve the complete organization of the currency system. It will include a repeal of the law compelling the purchase of silver by the Government, and will provide for the deficiency of currency by arranging for a repeal of the State bank tax and an issue of currency by the banks under the State charter under the general supervision of the general Government. The security for the currency will be provided for under the laws of the States requiring the approval of the Government." We give this dispatch for what it is worth.

Mining Share Market.

Mining stocks continue dull, both as to price and volume of business. At Virginia a draft of 35 men was made Monday from the force employed in the Savage mine and a draft of 10 from the Belcher. The draft will result in the suspension of ore extraction from these mines, which have been jointly producing about 4000 tons monthly. The failure of bullion returns of ore to cover the cost of production and of the shareholders refusing to pay the assessments levied to defray the operating expenses are given as reasons for the curtailment in the number of employees.

At the annual meeting of the stockholders of the Chollar Mining Company 95,101 shares were represented and the following officers elected for the ensuing year: A. K. P. Hannon, president; Thomas Cole, vice-president, and E. F. Barrett, Thomas Anderson and D. C. Bates, directors. C. E. Eliot was re-elected secretary and A. C. Hamilton, superintendent. The secretary's financial statement showed an indebtedness of \$11,983.70.

Three new mining companies have just been incorporated to mine for precious metals and reduce gold and silver-bearing ores in the new mining district of Vanderbil in San Bernardino county.

The mines are situated on what is now known as the "Bonanza ledge," at the town of Vanderbil,

MINING SHAREHOLDERS' DIRECTORY.

COMPILED EVERY THURSDAY FROM ADVERTISEMENTS IN THE MINING AND SCIENTIFIC PRESS AND OTHER S. F. JOURNALS.

and they cover 3000 feet of the mining ground that W. S. Lyle and George R. Wells, the well-known mining men of this city, have been working for the past six months under bond from the original discoverers.

Within the past three weeks John W. Mackay and James L. Flood have bought an undivided half in the property, and the new mining incorporations now referred to have been formed to carry on the business of developing this new mineral deposit.

The capital stock in each of the three mines is \$10,000,000, divided into 100,000 shares of the par value of \$100 each. The companies are named the Gold Bar, the St. George and El Rey d'Oro. The stock in each of the companies is divided up as follows: James L. Flood, 24,000 shares; George R. Wells, 25,000 shares; Wm. S. Lyle, 25,000 shares; John W. Mackay, 25,000 shares and James E. Walsh, 100 shares.

Work is now being actively prosecuted on this group of mines, and the erection of a mill will commence within a few weeks.

Judgment for defendants has been given by Judge Slack in the case of Oscar Steel against M. W. Fox and other directors of the West Consolidated Virginia Mining Company. It is held that the 23,190 shares of stock, and no more, rightfully belong to Steel, and that no fraud has been committed by Fox and his associates. This is practically a victory for Fox.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING MARCH 7 1893.

- 492,952.—FRUIT GATHERER.—S. F. Ball, Winters, Cal.
 - 492,953.—CAR LAMP.—Emile Boesch, S. F.
 - 492,954.—CAR LAMP.—Emile Boesch, S. F.
 - 493,148.—MACHINE FOR DRESSING TOBACCO.—Henry Bohls, S. F.
 - 493,208.—VAGINAL STRING.—A. B. Crickshank, S. F.
 - 492,957.—MEASURING VESSEL.—E. L. Detrick, San Francisco, Cal.
 - 493,157.—REFRIGERATOR.—Gardiner & Millins, Spokane, Wash.
 - 492,865.—ILLUMINATING TILE.—H. Hanstein, S. F.
 - 492,803.—PACKING VESSEL.—H. C. Hunter, Alameda, Cal.
 - 492,804.—PACKING.—H. C. Hunter, Alameda, Cal.
 - 492,805.—SIDE SEAMING STAFF FOR CANS.—H. C. Hunter, Alameda, Cal.
 - 492,806.—PACKING VESSEL.—H. C. Hunter, Alameda, Cal.
 - 492,962.—GRINDING PAN.—J. H. Kinkead, Virginia, Nev.
 - 493,097.—VEHICLE HUB.—L. C. Lahady, Tacoma, Wash.
 - 493,103.—ROTARY SICKLE CUTTER BAR.—J. S. Mathens, Pendleton, Or.
 - 493,179.—RAILWAY SWITCH.—Richard Nash, Ellensburg, Wash.
 - 492,965.—KILN.—J. O. Neil, Sacramento, Cal.
 - 492,945.—CHURN.—J. Phegley, Harrisburg, Or.
 - 493,223.—CHEERNS, DRAFTS, ETC.—J. F. Shafer, S. F.
 - 493,125.—ELECTRIC R. R. DANGER SIGNAL.—Paul Seiler, S. F.
 - 493,128.—MUSIC BOARD.—H. S. Sharpe, Seattle, Wash.
 - 493,129.—CAM FOR STAMP MILLS.—G. A. Thompson, Tombstone, A. T.
 - 22,270.—DESIGN FOR CAN.—M. J. Kinney, Astoria, Or.
 - 22,263.—DESIGN FOR TYPE.—G. F. Schroeder, Mill Valley, Cal.
- The following brief list by telegraph, for Mar. 14, will appear more complete on receipt of mail advices:
- California.—Seneca L. Berry, San Francisco, water-wheel; Theodore Bessing and W. A. Barker, Los Angeles, display shelf and carpet elevator; John W. Criles, Sacramento, vending machine; Charles W. Hinton, Los Angeles, car coupling; Rebecca E. Hooper, San Francisco, guide shield for type-writing machines; Benjamin Mattress, Schriener, stump-extractor; Mary E. Prescott, San Francisco, mop-wringer; Henry Scaake, San Francisco, cap-making machine; Walter N. Sherman, Merced, adjustable ventilating canopy frame for heds; Jacob

F. Shultz, San Jacinto, plow shovel; Robert Steedman, Berkeley, setting gauge for door frames; Geo. H. Tjelen, San Francisco, apparatus for transferring or stenciling upon transparent or other material; John N. Tilgney, San Diego, adjustable support for bracket tables; Emory L. Townsend, Los Angeles, manufacture of hose couplings.

Washington.—Henry M. Hoyt, Spokane, copying press; James R. McGregory and G. O. Perry, Centralia, nautical signal.

Gravel.—Robert D. Hume, Gold Beach, machine for forming can bodies; Thomas J. Snyder, Wallawa, hay-loader; James M. Wallace, Portland, fire ladder.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s Scientific Press U. S. and Foreign Patent Agency, the following are worthy of special mention:

CAR LAMPS.—E. Boesch, S. F. Nos. 492,953 and 492,954. Dated March 7, 1893. These inventions relate to such lamps as are used on railway, street and other cars. One of them consists in certain details of construction by which the inventor is enabled to produce a downward draft of air exterior to the lamp-chimney, said air passing through openings in the burner, thence upwardly within the chimney and its extensions. It also equalizes these two drafts against any sudden jars or shocks so as to prevent the lamp from smoking or burning irregularly. It further consists in a means for introducing and supporting the oil-fount from the lower part of the lamp-body; a cover or drip-cup with air-circulating spaces, and means for making a tight joint between the oil-fount and the lamp-body; and an improved means for supporting and steadying the lamp-chimney. The other patent covers certain details of construction in the class of lamps which are fixed to the ends of a car to light the car lengthwise, and are so constructed as to light also the platform with the same burner.

MEASURING VESSEL.—E. L. Detrick, Susanville, Lassen Co. No. 492,957. Dated March 7, 1893. This is a combined containing and measuring device for liquids. It consists of a receiver, with means for delivering the liquid therefrom, a tilting measuring device journaled with relation to the receiver so as to be filled therefrom, and be discharged without removal.

CONTINUOUS BRICK KILN.—James O. Neil, Sacramento. No. 492,965. Dated March 7, 1893. In the construction and operation of continuous kilns a circular or elliptical structure is formed, having chambers extending all around adjacent to the exterior wall and an interior passage into which smoke and products of combustion are led from the burning chambers and from thence up the chimney. The kilns are usually built up of brick and have the continuous series of chambers extending around the whole circumference. These chambers have suitable doors or entrances at the sides through which the bricks are set in the kiln for burning and afterward removed. During the process of burning, these exterior doors are closed and not opened until it is desired to remove the bricks. Mr. Neil's improvements are mainly in details of construction. He is enabled to convey away a greater portion of the moisture which is in the bricks when they are first set in the chamber, and prepare them for the further application of the drying heat, and the bricks are thus gradually prepared for burning.

ELECTRIC RAILROAD DANGER SIGNAL AND BELL.—Paul Seiler, S. F. No. 493,125. Dated March 7, 1893. The object of this invention is to provide a proper danger signal and utilize the present construction of trolley wires and electric-power current to operate danger signals in the shape of bells, lights, semaphores or other devices at street-crossings or other places to announce the approach of trains or cars. In this device it is not necessary to maintain batteries to operate the lights or bells, but the current which operates the cars is utilized by

means of an attachment on the trolley-wire insulator and a support which carries the mechanism to be operated by the trolley of the passing electric car. This attachment can be placed at a suitable distance away from the crossing to announce the approach of a car, and another attachment placed at the crossing to stop the bell or operate the signal at a car.

FRUIT-GATHERER.—Samuel E. Ball, Winters, Yolo Co. No. 492,952. Dated March 7, 1893.

This is one of that class of fruit-gatherers in which an expandible and collapsible receiver is adapted to encircle the tree trunk. The object of the invention is to simplify the carrying device of the receiver, rendering it possible to transport it and to manipulate it with less labor and fewer hands, and at the same time providing for all necessary adjustments to suit the lay of the land.

Assessment Notices.

SUPERIOR MILL AND MINING COMPANY. LOCATION of principal place of business, San Francisco, Cal. Location of works, Placerville, El Dorado County, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 15th day of February 1893, an assessment (No. 1) of five cents (5c) per share was levied upon the Capital Stock of the Corporation, payable immediately in U. S. Gold Coin, to the Secretary, at the office of the Company, Room 2, No. 323 Front St., San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 20th day of March, 1893, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Wednesday, the 5th day of April, 1893, at 1 o'clock P. M., to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.
I. N. WITHROW, Secretary pro tem.
Office, Room 2, No. 323 Front St., San Francisco, Cal.

POSTPONEMENT.

At a meeting of the Board of Directors of the Superior Mill and Mining Company held on the 28th day of February, 1893, the day of delinquency in the above assessment was postponed to April 3d, 1893, and the day of sale to MONDAY, April 24th, 1893, at the same hour and place.

FALL RIVER CONSOLIDATED GOLD QUAKIZ MINING COMPANY. LOCATION of principal place of business, San Francisco, Cal. Location of works, Plumas County, Cal.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 3d day of February, 1893, an assessment (No. 10) of two cents (2c) per share, was levied upon the Capital Stock of the Corporation, payable immediately in U. S. Gold Coin, to the Secretary, at the office of the Company, 313-315 Front St., San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 23d day of March, 1893, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Monday, the 17th day of April, 1893, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
ADOLPH LOESBACH, Secretary.
Office, 313-315 Front St., San Francisco, Cal.

Books on Assaying.

BY C. H. AARON.

Part I.—Gold and Silver Cres.

SECOND EDITION—PRICE \$1.

This work is written by an experienced metallurgist who has devoted many years to assaying and writing on the subject of the Pacific side of the American Continent. He writes hereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning. The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a concise form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:

Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assay; Examples of Dressing; The Melting in Crucibles; Scoriafication; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expeditives; Assay Tables.

This volume embraces 130 12mo. pages, with illustrations well bound in cloth; 1893. Price, \$1. postpaid. Sold by DEWEY PUBLISHING CO., Publishers, No. 220 Market Street, San Francisco.

Parts II and III.

Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Etc.

SECOND EDITION—JUST OUT.

Price \$1.75.

This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.

FRUE ORE CONCENTRATOR

OVER 3200 IN ACTUAL USE.

Manufactured under Patents of April 27, 1880; September 18, 1883; July 24, 1888; and March 31, 1891.

SAN JACINTO ESTATE, LIMITED,
Office of General Manager,
P. O. Address, South Riverside, San Bernardino Co., Cal.
CAJALCO, Dec. 18, 1891.

MESSRS. ADAMS & CARTER, 132 Market Street, San Francisco, Cal.—GENTLEMEN: After a continuous trial of different concentrators comprising the Frue Vanner, the "Holland," "Paradox," "Triumph," and the "Woodbury" concentrators, extending over several months, we find that we prefer the Frue Vanner, as it is easier of adjustment, runs smoother, has less wear and tear, and—having a positive travel—gives less trouble than the other more complicated and ever changing machines now in use here. The Frue Vanner not only saves a cleaner concentrate, but has less loss in the tailings, and is in several ways preferable to the other concentrators here.
I am, my Dear Sirs, Yours faithfully,
S. HARRIS, Manager

For any information, or for pamphlets, or for circulars or testimonials, call on or address

Price of 4-foot wide Plain Belt Frue Vanner..... \$550, f. o. b.
" " Improved Belt Frue Vanner..... 800, f. o. b.
" 6-foot " Plain Belt Frue Vanner..... 800, f. o. b.

H. J. SUMMERHAYES, Successor to Adams & Carter, Agent for the FRUE ORE CONCENTRATOR.
No. 132 Market Street. - - San Francisco, Cal.

RISDON IRON WORKS.

Cable Address, "RISDONS."

S. E. CORNER HOWARD AND BEALE STS., SAN FRANCISCO, CAL.

IMPROVED MINING, MILLING, MARINE AND OTHER MACHINERY OF ANY REQUIRED MAGNITUDE.

A COMPLETE STOCK OF CORLISS, AUTOMATIC AND SLIDE-VALVE ENGINES ON HAND.

Water Works for Town Supply,
Irrigating Plants,
Electric Lighting and Electric Road
Machinery,
Cable Road Machinery,
Mill & Mining Appliances of All Kinds,
Sugar and Ice Machinery

A Power Plant for Seattle.

B. T. Lacy, President of the Parke & Lacy Co., of this city, has filed a notice of a claim to the water of Snoqualmie falls, Wash., for the purpose of generating power to be transmitted by electricity to the towns between the falls and Seattle. Mr. Lacy intends to divert the water by partially damming or bulkheading, and connecting it by a pipe-line to impact water-wheels below the falls. The power of Snoqualmie falls is sufficient to operate all the machinery and all the street railways in Seattle, as well as that in other towns on the line. A number of Pelton or Dodd wheels will be placed at the foot of the falls and will transmit the power to shafting which will convey it to an electric plant on the banks. From these dynamos the electric current will be carried in an almost air-line to the city, where the current will be distributed by smaller wires to the points where it is to be used. The line will pass through Gilman, Newcastle and Renton, situated at different points between the falls and Seattle, and at each place power will be supplied where wanted.

The Snoqualmie falls are distant from Seattle 18 miles in a direct line, but the line of wire will probably be 23 miles, owing to the presence of a lake in the direct line. The drop of the water at the falls is 268 feet, and from 10,000 to 15,000 horse-power can be obtained all the year round. Mr. Lacy has not worked out all of the details of the plan, but is now in consultation with the electricians as to the feasibility of the scheme. A company will be formed to build and operate the plant, which will require the expenditure of about a million dollars. Cheap power can be supplied for sawmills, railroads, pumps, etc., and light and heat be obtained also. The possibilities of the enterprise are very great. The water, after being utilized in the wheels, will be returned to the river, or some of it may be used for irrigation purposes.

It is stated that the Snoqualmie falls present the feature of the greatest volume of water falling perpendicularly from such a height—268 feet—in the United States. The engraving on this page, made direct from a photograph, gives a view of the falls. It will be seen that there is a large body of water and a splendid opportunity to utilize it on "hurdy-gurdy" wheels, such as are in common use here with high heads. Mr. Lacy's scheme seems entirely practicable. Electric power has been carried much farther than the distance necessary here. The well-known example of the Frankfort-Lauffen experiment showed the current could be made available for a distance of 107 miles. Of course, in that instance great care was exercised in the whole installation; but it showed what may be done. The greatest distance on the Snoqualmie falls scheme is 26 miles.

Seattle is destined to become a great manufacturing cen-

ter as the city grows, and already there is sufficient demand for power to make an enterprise such as this pay. In addition, there are the smaller towns on the line to be considered.

If rumors are true the famous old camp of Aurora, Nev., will see a revival this summer. The news is that capital has been raised to resume work on the Oon. Esmeralda mines in that camp. It is the intention to run a long tunnel and drain the mines several hundred feet below the

SNOQUALMIE FALLS, WASHINGTON.

present workings. Electrical developments have something to do with this for they intend if the showing warrants, to put up a mill to be run by electricity, this to be transmitted from dynamos on Walker river. Aurora was a most famous camp in the old days, but went out of sight. There was a revival a few years ago but it was temporary only. Many never lost faith, however, and will be glad to see money spent there intelligently this year. The existence of large and paying bodies of ore may be proven.

It is not probable that there will be any Mechanics' Institute Fair this year.

Distinction Between Geology and Mineralogy.

Although the two sciences are so intimately connected that the two terms are often used synonymously there is in fact a wide distinction. To give definitions in the simplest form of words, Geology treats of the structure of the earth and the changes it has undergone from its creation out of chaos to the present time; Mineralogy describes in detail the various component parts or substances of which terrestrial matter is formed, and declares the forms, properties and qualities of those substances. For instance, the geologist, in passing by a deep railway cutting, or descending the shaft of a mine, possibly finds a stratum of rounded pebbles, and knows that they have acquired that form by friction, as they have been driven over rocks or against each other by moving water in some bygone age.

The mineralogist examines the component parts of the stratum, and finds that the pebbles are composed of granite, quartz, greenstone, etc. Again, the geologist observes that a deposit of a bluestone or lava, many feet in depth, has overlaid thick beds of sedimentary rocks, or a drift of pebbles and gravel, and knows that the lava was once in a molten state and ejected from a volcano at some period of the world's history. The mineralogist observes the character of the lava. He finds it is of that specific kind called "amygdaloidal" basalt from the almond-shaped cavities in the mass, and he possibly finds some crystals of olivine in those cavities. The mineralogist then declares the value of the basalt for its toughness and durability as a building stone or metal for roads, and of the olivine as an ornamental gem, known as crysolite. In short, it is the object of mineralogy, as well observed by Prof. Ansted, to describe the form, the internal structure, the chemical composition, the physical properties and the uses to man of all those natural material productions or substances which are not organic, i. e., which do not possess vitality or the power of reproduction like animals and plants.

THE Johannesburg (South Africa) gold mines yielded 1,290,000 ounces in 1892 and expected to turn out 1,600,000 ounces this year. At the

beginning of 1892 the number of stamps at work was 1540, and at the close of the year 2035. There was, however, a decreased yield per ton from the mill of 1.36 dwts., attributable to the compulsory working of lower grade ores; but the total yield from all sources averaged 12 dwts. 13 grs., against 12 dwts. 5 grs. in 1891.

THE growing activity in building is illustrated in the lists of recorded contracts. In the past six working days thirteen contracts were recorded, representing a pledged outlay of \$291,080. Last week fifteen contracts were filed, amounting to \$47,330.

Comment.

The chief of the Mines Department of the World's Fair, Mr. Skiff, says that it is assured that in the Mines and Mining Building will be gathered in 1893 incomparably the largest array and most complete and most instructive evidence of the mineral wealth and progress of the mining industry ever collected or attempted. This is the first time at any great exposition that there has been a special separate department of mining. The mineral exhibits will have a special building with a floor space of about nine acres. We are rather sorry that there has not been more interest in the California part of the exhibit than has thus far been shown. Were it not for the already collected specimens of the State Mining Bureau, we should make a poor showing. Even now we have no hope that the California portion will come up to what it should. There have been no systematic efforts to cover each county in the State. The Commission set aside for mining \$15,000 which was afterward, if we are rightly informed, reduced to \$8000, and most of this will be spent on salaries, etc., during the exhibition. There was not enough spent on making the necessary collections and preparations. Had a special superintendent been chosen months ago and given nothing else to do, there could have been made the finest exhibit of any State in the Union.

In a recent number of the PRESS we gave the reasons for the closing down of the Bunker Hill and Sullivan mines in the Cour d'Alene district, Idaho, and predicted that other mines would have to close unless the conditions were changed. Other smaller mines at Wardner have since stopped work and now the Morning mine at Mullan has followed suit. This is a rich mine, making a large production and employing a good force of men. It is unfortunate for the region that the railroad companies persist in maintaining such high freight rates in the face of reduced prices of silver and lead. The mines cannot stand such rates. It is impossible for them to continue. At present the mines are being worked mainly at a profit to the railroad companies. The situation is not pleasant, especially to the working miners, who are thrown out of employment.

It is stated that Secretary Carlisle will try the experiment of outside competition for architectural designs for some of the important public buildings shortly to be erected. These designs have heretofore been made by architects in the Government service. None of these gentlemen seem to have any ideas respecting the necessity of light. The interiors of their buildings are as dark as jails and the exteriors more like warehouses than anything else. At least, that is the experience in this city. It will be a

relief to see a handsome Government building, well lighted and airy. The new postoffice at Sacramento is a notable exception as to appearance, for it is really attractive; but our Appraisers' Building, Treasury and Mint in this city are expensive structures with no elements of beauty in design. It is a hopeful sign that "outside" architects may compete in this matter, for we are apt to have something worth while in the new buildings which the Government is to build.

It is expected that the consumption of copper in the United States this year will be exceptionally heavy, especially for electrical purposes. The rapid development of electrical processes and plants has been of great benefit to the copper miners in recent years, greatly increasing the demand for the metal. It is probable that electrical transmission of power will be more generally adopted in the future and many plants will be built. All of these plants add to the demand for copper. The English consumptive demand for copper of all descriptions has decidedly improved of late, and were the market to display more signs of stability there is little doubt that this demand would further develop. A committee has been appointed by the American producers to negotiate with the European producers for a continuance of the present arrangement—which lasts to the 30th of June—and as it has hitherto worked very smoothly and satisfactorily, it is fully expected that it will be continued for a further period. Although it has not so far led to any improvement in the value of copper, it has prevented the serious fall we might otherwise have experienced from excessive production, and has therefore proved advantageous to all the parties to the agreement.

The Riddles nickel mine, Oregon, is reported sold to an English syndicate. A reduction plant was recently put up but was not started. It is to be hoped that the rumor of the sale is true, but the English owners of the Canadians' nickel mines already have more metal than they want. They cannot sell all their products, the demand being limited. If it can be produced cheaper here than in Canada, it would be all very well, but this is doubtful, to say the least.

At a meeting of the Executive Committee of the State Miners' Association on Thursday a handsome gold watch and chain with a diamond locket and gold pencil was presented to Senator T. L. Ford; and a gold chain with locket was given to Assemblyman Thomas of Nevada county, in recognition of their services in the miners' cause during the recent session of the Legislature. The gifts were entirely unexpected but well deserved. Both gentlemen labored hard for the miners' interests during the entire session, and their friends will be pleased to learn of these handsome marks of appreciation having been presented to them.

California Chrome Ores.

The condition of the chrome ore industry in California is not very satisfactory owing to the great distance from the centers where the ore is utilized, the cost of freights to said markets, the desultory system by which the mining is carried on, and the rate of the tariff on foreign ore. The dealers contend that at the present tariff it is almost impossible for them to compete with the foreign article. Moreover, the richer ores from those deposits within any reasonable distance from railroads, have already been taken out and shipped, leaving the poorer ores until the conditions will permit of their being profitably mined and shipped.

It is well known that there are many good deposits of this material in the Coast and Sierra ranges of mountains which cannot at present be utilized because of their distance from railroads; and the uncertainty of extent of such deposits prevents their being developed and roads opened to them. In fact with those already opened it is as much a question of building roads as one of opening mines. In nearly all instances roads must be built to the deposits so that the mined material may be hauled out. Oftentimes these roads alone have cost more than was obtained for the mineral mined, and when the deposit has been worked out the road is of no value whatever. Thus far those deposits which have been mined have been those most accessible, the others being left for future use.

Another drawback to this class of mining is the fact that the general grade of the ore is not up to the standard required in the markets. What is wanted is 50 per cent ore while the general average of the California ores may be stated at about 45 per cent. Works have been established in Alameda county where the ore is brought up to the standard by a system of concentration, but this naturally adds somewhat to the expense. When the grade of the ore is high there is no difficulty in the sale but much of it offered will not come up to the required standard.

The ore does not occur in defined fissures or in large de-

posits. Tracts of land containing chrome may have a dozen or so deposits in irregular bunches or masses of greater or smaller quantity. When the miner starts in to work a deposit he can have no idea of its extent and he often takes out only forty or fifty tons when his deposit becomes exhausted. Again, a thousand or more tons may be taken from one place. Moreover, the ore does not always keep at the same grade, and while the miner may take out a quantity of standard grade ore the rest of the deposit will fall below this and be practically valueless. It is a most uncertain kind of mining.

Those engaged in the business do not follow it as do miners of other materials. When freight rates fall to a certain figure the men will get out as much as they can and sell it to the dealers. When freight rates rise again they stop work on the mines and take up other occupations.

It often happens that a whole district will be very busy for a time and then work will cease for months or years. The men work at the bunches or small deposits, generally paying a royalty to the owner of the land. Various small lots of ore are scattered over the field and these the buyers for the Philadelphia or Baltimore firms purchase from the miners, and ship at convenience. Again, these buyers work the deposits themselves and collect the ore. They often arrange with a set of miners to take out ore from certain deposits, building roads themselves to get the product to the market, and paying the miners a fixed rate per ton for what is mined. There is more or less risk in this, of course; but the miners are generally poor men with no capital to invest in such a business. It is not as if the miners owned the ground and worked it the same as a gold or silver claim. They may take up a claim and work it out, but the deposits are of such uncertain extent and value that there is little or no permanency to such a mine, if mine it can be called.

There are instances, such as the Pick and Shovel mine in San Luis Obispo county, where the same claim has been worked for years, off and on; but that is only worked by one or two men, who mine in it after a desultory fashion. Occasionally they get out a batch of fifty or so tons of good ore, and then work on a small seam or stringer for a long time before they come to a bunch of any value. On making a "stake" from a hundred tons or so they abandon the mine for the time being, until they feel like again working it. Chrome ore mining is really a species of "pocket mining," since the deposits so often occur in small bunches, and the pocket being worked out the location is abandoned and a new one sought near by.

Foundry Notes.

THIS State is largely dependent on British Columbia for a coal supply. The coal imports from there have increased from 32,300 tons in 1873 to 427,900 tons in 1892. The largest imports were in 1891, when there arrived by sea in San Francisco 521,400 tons of British Columbia coal. The output of the Vancouver mines employs a considerable amount of tonnage belonging to the port of San Francisco. Of late years steam colliers have taken the place of sailing vessels, and they are kept constantly moving up and down the coast. The arrangements for loading and discharging admit of rapid dispatch and little time is lost. Duty is of course paid on this coal, and the local foundrymen are anxious to see this removed. A petition has gone on to Congress asking for the removal of duty on foreign coal and iron, signed by all the iron manufacturers here. It seems unfortunate that California, which is so well supplied with so many other mineral substances, should be lacking in coal deposits. What little coal we have is of poor quality.

THE New York Times has been publishing some foolish yarns about the failure of the boilers of the Monterey, and other newspapers have printed corresponding paragraphs, arguing that the ship is a failure. Nothing could be further from the truth. At the time of the official trials there were on board the Monterey the following eminent officers: Admiral George Brown, Chief Engineer S. F. Kutz, Captain Louis Kempff, Chief Engineer George Burnap, Chief Engineer Joseph Tulley, Commander B. C. Pendleton, Lieutenant J. W. Carlin, Lieutenant B. F. Nicholson and Naval Constructor Taylor. The board had a number of other Government engineers to assist them. All during the trial trip there were two Government engineers at each boiler keeping watch, and if anything had gone wrong it would have been reported. They forwarded all their reports, going even as far as to send the private notes made, and after considering the subject fully and examining all the reports, Chiefs Melville and Wilson, of the Navy Department at Washington, made a report in which the following passage occurs:

"From a careful study of the data received from the trial board and of the notebooks of the assistants engaged, we are of the opinion that, with proper firing and attendance on the machinery, a sustained power of at least 5400 I. H. P. can easily be maintained for four hours, and we consider the department fortunate in obtaining the vessel at a reduced cost and without injury to the boilers, that is sometimes caused by a contractor forcing them to the uttermost during a trial to gain premiums for increased power."

From this, it will be seen that the Government found the Monterey's boilers to be in good condition, and this is

proved by the way she has since borne up under high steam pressure.

The Monterey is in perfect condition and ready to go to sea at any day. The publication in the Eastern paper is very unjust to the Union Iron Works of this city, having no foundation whatever in fact. In any event, the Ward boilers were not made by these works, but were ordered in the East by the Government and supplied to the vessel. But they work all right anyhow, and there is no fault found with them. The Monterey was designed to have two Scotch and four tubular boilers of the type which proved best upon an experimental trial. The conditions of this trial were thoroughly advertised, and all builders of tubular boilers were requested to forward types of their boilers to the navy yard at Brooklyn, where they would be correctly tested by a board, of which ex-Engineer-in-Chief Loring was president. Of the boilers submitted for trial the Ward boiler proved the best in every respect, as experience on board the Monterey has justified.

It is stated that there is talk of a small rolling mill being established in Los Angeles. Mr. Chamberlain came there from the East at the solicitation of Mr. A. S. Robbins of Los Angeles, to investigate the matter. He considers the situation favorable for a mill which should make 10,000 or 12,000 tons of ore annually. Mr. Chamberlain says:

"The estimated cost of such a rolling mill is in the neighborhood of \$150,000, and it will be designed to make all kinds of light plate and sheet-iron from a quarter-inch thick down to the thinnest stove-pipe iron, and all kinds of bar iron and angle iron except the very large sizes, also small T-rail. When the mill runs to its full capacity it will employ from seventy-five to one hundred men, and it will be so arranged that, if the market demands, additional machinery can be easily added. I find there is brought into southern California yearly a much larger amount of iron than this mill can make and the demand is rapidly increasing. The material used in the manufacture of this iron will be old iron rails, wrought iron scrap and a soft or low carbon steel, and to some extent, old steel rails which we expect to get largely from territory tributary to Los Angeles. In regard to competition? Well, for merchant iron competition will come from San Francisco and the Eastern States; for sheet iron, entirely from the East, as there are no sheet iron mills on the Pacific Coast, consequently there will be a large field in which to sell this part of the mill products. The high price of coal will effect the industry to some extent, but crude petroleum is now being extensively used in the East with great success and economy in heating iron in heating furnaces and under boilers. This is being done where coal can be bought for from 75 cents to \$1.30 per ton and oil at 65 to 75 cents per barrel. We shall use oil in our beating furnaces and probably for generating steam. The company has been started under the name of the Los Angeles Iron and Steel Company, with a capital of \$150,000, and the following Board of Directors has been elected: F. N. Myers, A. S. Robbins, J. H. Harris, Damerall and C. D. Pillsbury, who have organized by electing F. N. Myers president and treasurer; A. S. Robbins, vice-president; W. B. Smith, secretary. Seventy thousand dollars has been subscribed, and the balance of \$80,000 will probably be placed in the next 15 days. The mill will probably be in operation by October 1st, and the annual payroll will, if the mill is run on full time, be over \$50,000, and the value of the manufactured iron will be about \$500,000.

A SHIPMENT of 251 tons of armor, forming the plates of the battleship Oregon, left the Bethlehem (Pa.) Works this week for the Union Iron Works, San Francisco, where the Oregon is being built.

Mining Briefs.

TIN sells in England just now at £92 5s per ton.

ANTIMONY is selling in Liverpool at £41 per ton.

SULPHATE OF COPPER continues in poor demand in England at £15 10s for early delivery.

AMERICA is sending more copper to Liverpool and Swansea than Chile does. In the first two months of this year we sent over 4107 tons while Chile sent 3428 tons.

THE Phoenix Mining Co. (A. T.) is going to build a large dam to store water, with which to hydraulic the mountain of earth in which its ledges lie. The dirt carries free gold.

THE steamer Dora, from Alaska, brought down 100 tons of concentrates from the Apollo mines on Unga island. This vessel went up from here February 10th and took miners and supplies to these mines. Forty men are at work.

THE Alaska Treadwell Mining Company proposes to have thirty bars of gold, or rather their counterfeits, exhibited at the World's Fair as part of the Territory's representation. The original bars are valued at about \$800,000, and represent a year's product of the mine on Douglass island.

SOME men are "mining" out on the ocean beach for a cheat supposed to be filled with the gold of early Spanish voyagers. They have been several weeks sinking a shaft through the sand. Like some other claims we have heard of, most of the mining appears to be done in the newspapers.

P. J. COLE has returned to Phoenix, A. T., from the Plamsa mountains, and says there is plenty of rich float, but no defined ledges have been struck. The formation is slate, with narrow seams of quartz, and all the water used has to be hauled for miles, therefore he advises burro prospectors not to attempt the trip.

WILLIAM AND LEM JONES, two brothers engaged in mining on Olney creek, six miles from Redding, Shasta Co., while making a cleanup of their placer diggings, found two lumps of gold worth \$500 and \$200 respectively, besides getting about \$300 in smaller pieces and dust. Their find has created considerable excitement.

Coast Industrial Notes.

THE steamer Crescent City, which left this week for Sitka, carried north nearly fifty tons of black and giant powder to be used in the mines.

AN election on the question of issuing \$30,000 in bonds for the establishment of a sewer district will be held at Fruitvale, Alameda county, on the 15th prox.

THE Board of Supervisors of Shasta county has appropriated \$2000 for a general exhibit of that section's resources at Chicago. The Sacramento county appropriation has been increased by \$1500.

THE trustees of the Moses Hopkins Academy expect to spend \$150,000 in buildings and improvements. They visited Martinez, San Leandro and Haywards during the past week to look at sites that have been offered.

THIS week there were shipped to Chicago two carloads of building stone and marble, composing the ornamental facade which will decorate the entrance to the California mineral exhibit in the national building of Mines and Mining.

THE citizens of Paso Robles, San Luis Obispo Co., have held a meeting to discuss the feasibility of bonding the city for water works and a sewer system. A committee was appointed to look into the matter. The cost of the sewer will be \$60,000 and the water works \$50,000.

THE people of Santa Rosa are raising a bonus of \$25,000 to induce the Wentworth boot and shoe factory to remove to that place from Oakland. Mr. Wentworth, the manager, says that the factory will remain in Oakland if a similar bonus is raised to keep it. The factory employs seventy men.

ARTICLES OF INCORPORATION of the Stockton Power Transmission Co. have been filed by San Francisco men associated with local capitalists, with a capital of \$1,000,000. The company will generate electricity with water-power on the Mokelumne river, forty-two miles from Stockton, and transmit it for sale to manufactories.

THE electric road which will connect Oakland with Alameda will be in operation in a few weeks. The iron poles are all in position and the work of stretching the wires has commenced. The power and car-houses at the west end are being rapidly pushed to completion, and four cars are ready to leave the car-shops in Oakland.

JACKSON, AMADOR COUNTY, is certain to have an electric-light plant. Richard Webb is organizing a local company, and for several days has been soliciting orders for lights and subscriptions for stock in the new concern. Citizens are showing a disposition to encourage and foster the enterprise by liberally responding. Mr. Webb is well satisfied with the result of his efforts and expects to have the town lighted by electricity in a very short time.

UKIAH, MENDOCINO COUNTY, wants a better system of sewerage. At a mass meeting this week it was decided to instruct the Town Trustees to appoint a committee to ascertain the cost of a main sewer from the center of the town to Russian river, a distance of one mile. The committee was further instructed to negotiate for the purchase of a forty-acre lot on the river bank for the location of a cesspool.

THE traffic department of the State World's Fair Commission has been advised that the desired concessions in freight rates upon exhibits shipped to Chicago which were discussed at the recent meeting of the Transcontinental Association at Monterey have been granted in some particulars. A classification of such shipments as "World's Fair exhibits" has been made, and a general rate of 60 cents a 100 pounds has been established. The rate applies to carload lots of a minimum weight of 20,000 pounds to each car.

AT the last meeting of the Mechanics' Institute, the Committee on Library, Rooms and Buildings was empowered to see the architect and have him draw up plans for fitting up the basement of the building on Post street with concrete floors and furniture, so that it may be used as a reading room and for the storing of copies of public records. No action was taken regarding the proposed new library building, except that a committee of five is to be appointed by the chair at the next meeting to ascertain the needs and requirements of the new building and to report a general plan.

IF the city of Oakland opens all its streets to the waterfront as proposed, some of the buildings in the way will have to be removed. These are mainly manufacturing plants. There are the Starr flourmills at the foot of Clay street; the Pacific Nail Works, near the middle of Market street; the gas works at the foot of Grove street; a dozen or more lumber yards in the way of other streets, and the railroad yards obstructing all the streets from Peralta to the point. In the latter some of the streets, if extended, would play havoc with the buildings which stand squarely in the road.

THE large number of idle men that has in most instances been supported by charity during the winter shows no sign of decreasing in numbers in spite of the fact that spring is here, and it was hoped that most of the men would have gone out into the country by this time to look for employment. Inquiry at the charitable institutions shows that the number seems to be still on the increase. At the Salvation Army Lifeboat they serve about 700 to 800 free meals daily. The men who have tried for work in the country report affairs worse than in the city, the towns being full of men waiting for the farmers to begin work on their ranches.

WORK has begun in earnest on the South Gila Canal in Yuma county, Arizona. One hundred men and forty teams are at work on the dam. A \$30,000 pumping plant is being constructed on the mesa to supply the new town of Christoval and the laborers on the canal with water. The canal, with its branches and reservoirs, will irrigate 300,000 acres, and with the dam, which will be of solid masonry, will cost \$2,000,000. The dam will be 50 feet high and 1,400 feet long, and will form a reservoir 11 miles long.

THE canal will be 50 feet wide, carrying 8 feet of water, and will be 125 miles in length. It will take two years to complete the work. Five hundred men will be employed.

THE Bakers' Union, representing 400 members, the Confectioners' Union, numbering 80 members, and other labor organizations have petitioned the San Francisco supervisors to pass an ordinance prohibiting the delivery of bread, cakes and other pastry, by wagon or otherwise, between the hours of 12 o'clock midnight on Saturday and 12 o'clock midnight on Sunday, believing that such an ordinance would be a great boon to the bulk of employing bakers, as well as to their employes, and would work no injury to the general public, because, as they state, bread delivered under such an ordinance would be scarcely more than two or three hours older than bread delivered under the present system.

OUT in the employees' waiting-room of the Sutter Street Railway Company's car-house the recently-enacted law providing for one day's rest from labor out of every seven is conspicuously posted on the bulletin-board, and following the law the company has posted in large letters a notice as follows:

All employees of the Sutter Street Railway Company are hereby notified that if any one wishes to avail himself of the above law, and work but six consecutive days at any one time (except in cases of emergency, as above provided), he will immediately file a written notice to that effect with the superintendent.

Inquiry at the office brought out the information that so far not a single notice had been filed and none were expected. The Sutter Street Company is the only one thus far to take any notice of the law.

JAMES MARTIN, member of Parliament from New South Wales, and Special Commissioner from that country on Manufactories and Manufacturing Processes to the Columbian Exposition, is at the Occidental. On the same vessel on which he came are 500 packages of exhibits for the fair.

As Commissioner of Manufactories he has arrived in time so he can spend a good while in California, examining into the kinds of machinery and inventions used here. He explained that the natural products of California and New South Wales were very familiar. Fruit of all kinds, vines and grain may be produced in immense quantities. Mr. Martin wants to see how California fruits are canned and preserved; how milk is condensed, for dairying is a great industry there; to examine the great harvesting and threshing machines, plows and other implements, and thus recommend to his Government similar things. He will also study the processes of treating ores and the latest mining and reduction machinery.

A LARGE FORCE of men is at work on the foundation of a can-making establishment on the corner of Eighth and Brannan streets. The structure is to be 275 by 206 feet, one story high. The whole thing is to be done in 24 days. The walls are to be of brick, and in addition to the rows of wooden columns supporting the roof trusses there will be a dividing wall of brick in the center. The plans were finished and approved within 48 hours, and bids were at once called for. On Monday all the bids were received, and on Tuesday at noon the contract, amounting to \$22,000 was let to John McCarthy, with the penalty of \$50 a day forfeit for every day longer than the 24 allowed within which to complete the building and turn it over. It is estimated that between 50,000 and 60,000 bricks a day will have to be laid, and then there will only be three days' time for putting on the roof. The building is intended for a can-making establishment, and the reason assigned for the hasty construction is the failure of the Eagle Automatic Can Company to secure a renewal of its lease for its present quarters. Alvinza Hayward is the owner of the site and building, and as the land is not over-firm, the foundations have to be more elaborate than usual for such a structure.

THE steamer Mexico, the second one of the North American Navigation Co.'s vessels, which are carrying California freight to Panama on the way to the East, will take very much the same kind of cargo that the St. Paul did, only the amount will be twice as large. The freight includes several hundred barrels of California wine, including port, claret, sherry and white wines, and a large quantity of California brandy, most of it from the vineyards and distilleries of Sonoma and Napa valleys. There are big bales of rags, gathered in every part of the State, which are being shipped to the Eastern paper and shoddy mills. Another big item in the Mexico's manifest will be leather, both for shoe and harness-making, tanned at Napa or the Mission, and which is said to be the very best in the world. Paints, oils and varnishes will be a big item in the Mexico's cargo, judging from the large number of barrels and cases of goods on the wharf, which is even now twice as much as was sent away on the St. Paul, and there is more to come. Borax is another big item, but the quantity of canned goods already on the wharf forms a pile by itself as large as all the rest of the goods put together. It includes peaches, pears, plums, apricots, apples, grapes, quinces and damsons from almost every county in California, but the bulk of it came from the canneries in the Napa, Sonoma and Santa Clara valleys, and is consigned to almost every city in the Eastern States.

Personal.

ALEXANDER H. RUTHERFORD, the mining man, who died in this city last week, left an estate of over \$100,000.

CHAS. H. MITCHELL has retired from the Grass Valley Union, and Messrs. Calkins and Tyrell are now editors and proprietors.

SOME of the Arizona papers are urging the removal of W. C. Barnes, chairman of Arizona's World's Fair Commissioners, because he is opposed to free silver coinage.

JOHN HAYS HAMMOND, the well-known mining engineer, and manager of the Bunker Hill and Sullivan mines of Idaho, left San Francisco on Thursday for a trip to Europe.

The Stewart Mining Bill Again.

TO THE EDITOR:—In your issue of February 11th you printed a copy of the above bill and stated that it had been introduced in the U. S. Senate on December 10, 1891, where it was read twice and referred to the Committee on Mines and Mining. You also stated that on Feb. 2, 1892, the bill was reported with amendments. There must have been stealthy work in bringing forward the measure or the mining public would have heard of it long ago. I think Senator Stewart might use his influence and surplus energies to better advantage for himself and the mining interests of the country than by perpetually tinkering at our present mining law. There has been no special call made by legitimate mining capitalists, by miners or prospectors, or indeed by any one else, for a change in its provisions. Though it is not by any means perfect, yet on the whole it is giving satisfaction to practical men, and the fear that under the manipulation of wily persons a change in its requirements might make it worse than it is has led those well informed on the subject to oppose any new bill, particularly if it failed to amend the most objectionable features in the existing statutes. Unfortunately for those who go out into the mountain wilds of our land to search for mineral treasure, which when successfully exploited benefits all classes, a vain man, greedy for public notice, who as a political freak, finds himself a senator in the halls of Congress, assumes that he alone in our large population is capable of preparing a satisfactory mining bill.

HUNGERING FOR NOTORIETY.

At first sight it looks as if Mr. Stewart, in bringing forward a mining bill every year or two, has only been trying to keep his name before the public, but further on I hope to show that, greedy as he is for notoriety, he has also planned a change in the law of 1872, which, if adopted, will rob many honest prospectors out of their hard-earned properties. In case it may be supposed that I am slandering the Sagebrush Senator in saying that his first and apparent aim is to make sure of an immense amount of free advertising, I will state a few facts: On March 10, 1888, you published a letter from me criticising his bill then before Congress. In 1889 he wrote me for further suggestions, but as he had failed to heed many important hints on that subject, which at his own request had been offered in your pages by intelligent correspondents, I refused to aid him because his conduct seemed to prove that his great ambition was to get his name blazoned in print as often as possible. To him notoriety and fame may be identical, and as long as printer's ink costs him nothing he wants plenty of it.

On December 4, 1889, he introduced his second mining bill, but as it was an exact copy of that of the previous year, the only progress made was in the advertising line. On March 29 and April 5, 1890, you printed a long article from me criticising the 1889 bill, and though I scarcely expected that any of my suggestions would be adopted, I will candidly admit that in his third bill, introduced on December 19, 1890, Senator Stewart did actually make very important improvements. This bill was finally reported by the House Committee on Mines and Mining—Mr. Thomas H. Carter, afterward Commissioner of the General Land Office, making the report. Several important amendments were suggested in that report, but as they did not harmonize with Mr. Stewart's special views, hopes and aims the bill they related to was allowed to die a natural death. To keep the advertising whirligig going, however, a new bill had to be framed and the patient, long-suffering Senate of the United States was for the fourth time made the stalking-horse for this law-giving mountebank of the Great American Desert to get himself once more before the public as the most profoundly erudite mining lawyer and law-maker of his age—he being the judge.

A CHANGE THE SENATOR DID NOT MAKE.

The following was a new section proposed in the Carter report in the Stewart bill, but as the magnate of the Comstock lower levels could not stultify himself by fighting against land-grant railroad companies, he would have none of it:

Aimed by adding the following as Section 7:

SEC. 7. That no patent or other evidence of title to any land shall be given under or in pursuance of any railroad land grant heretofore made by Congress to aid in the construction of any railroad or to any public improvement, in any of the States and Territories known to be producing precious metals, where such grant reserved from its operations mineral land, unless it shall be made to appear to the satisfaction of the Secretary of the Interior not only that the conditions of said grant have been complied with by the corporation seeking the patent or evidence of title, but that each and every legal subdivision of the land for which a patent is sought, within such States or Territories, is such land as was not excepted out of or reserved from the operations of such grant, and no person shall be accepted by the Secretary as a competent witness as to the mineral or non-mineral character of land claimed under such railroad grant unless such witness shall have practical knowledge of the mineral-producing region to which the land is situated and shall have personally examined the land concerning the character whereof he testifies. The Secretary of the Interior may make such rules and regulations as may be necessary to enforce compliance with the provisions of this section: *Provided*, That all witnesses shall be subject to cross-examination by any citizen qualified to locate a mine, and the evidence of any witness may be rebutted.

Though Senator Stewart adopted several of the amendments I proposed to his bill three years ago, he persistently retains in the present measure certain objectionable features, which, for reasons given then, were severely condemned. He is willing to yield some points, in the hope that his chief despoiling scheme may, by his concessions, be overlooked until it has, by statutory enactment, been fastened on our mining people. What is the stake, then, that as a mining attorney he has been playing for during the past five years?

HOW THE SENATOR EXPECTS TO "STRIKE IT RICH."

Until May 10, 1872, mining lawyers had a grand money-making time. Under the mining law of 1866 it was unnecessary to say, in the notice locating a lode, in what particular part of a district it was situated. If a peaceful man found a rich ledge, some hoodlum prospector had a location a mile away, which he was ready to swear was the

vein just found and the finder was trying to rob him out of his property. To swing or "float" his worthless claim so as to make its lines cover the coveted ground was an easy, though at times a rather dangerous feat. For half his thieving interest, the "jumper," or "floater," could get an unprincipled lawyer to start a suit against the real owner, and by means of perjured testimony, more than enough of which was always at command provided the claim to be seized was rich, the "hoodlum" gained the day.

Behind the visible operators there was sure to be a soulless capitalist, who furnished means for the contest, and later on stepped in to reap the harvest for which he had so liberally sowed. Mr. Stewart knows all about such matters, for, 30 years ago, he was in the very thickest of that species of fighting on the Comstock lode.

What have these facts to do with the Stewart mining bill? They bear exactly on the case. I charge Senator Stewart with a deliberate attempt to so change the present law that to "float" mining locations on to the legitimately owned property of other people will be quite as easy as it was under the 1866 law. His advertising scheme was to be of service as far as it could be made to work with advantage, but, under the cover of that, his real prize was to be ultimately won. He hoped that people would get so well used to his mining hills that vigilance would be relaxed, and he would gain his end without suspicion as to his aims being excited. He is really fighting the battle of disreputable mining lawyers. Fortunately all in that business are not rascals. There are plenty of honorable mining attorneys who would refuse to touch a "floating" location case, but there are others who, in their half-starved condition, would be glad to take anything that came to hand.

THE MAIN OUTCOME.

There are crooked mining operators who could afford to pay \$50,000 if the present mining law were altered so that it would admit of "floating" locations being made as in the days of yore. It is needless to say that our mining capitalists are honorable men, who would not go into any undertaking worse than highway robbery, but did not recent suits in the courts prove that there are persons operating on the Comstock lode, who, as to moral turpitude, stand on an equal footing with Turkish and Italian brigands?

I do not say that Senator Stewart expects to be paid for his efforts to rob the existing law of its grandest protective feature. But if, after I have said all that I mean to say on that subject, he still attempts to carry out his mutilating plan, he will deserve to be branded by the prospectors and miners of the United States as a traitor to their interests of the murkiest dye.

HOW RASCALLY CAPITALISTS WOULD BE REIMBURSED.

If "floating" locations were once more made possible, crooked operators would keep prospectors of their own stamp in every good mining district not thoroughly prospected. These prospectors would always have notices on record ready for service. If a new discovery of value were made, it would be claimed forthwith as being one of their recorded lodes. When asked to point out their monuments, they would boldly declare that the new discoverer had purposely knocked them down. By force of arms they would drive the lawful owner away, and, setting up their own monuments and removing all others, the transfer of a location originally made half a mile distant would be complete. If the real owner had taken friends over the ground at the outset to see that there were no monuments on it, their testimony would be overcome by extra witnesses on the other side. Where a lone discoverer depended entirely on his own testimony, he would be crushed at once. Have I not seen that low-down game played again and again under the law of 1866? By the law of 1872 Senator Stewart and other mining lawyers lost heavily. He might now have had several "floating" cases to argue in the United States Supreme Court, whereas he has not a single fee in that line.

CUTTING OUT NINE VITAL WORDS.

I take the following in regard to the identification of lodes from the law now in force:

"All records of mining claims hereafter made shall contain the name or names of the locators, the date of the location, and such a description of the claim, or claims, located by reference to some natural object or permanent monument as will identify the claim."

The language quoted is so ungrammatical that Mr. Stewart, in drawing his new hills, ought to have sought the aid of some school-teacher to put the paragraph into passable English for him; but probably he supposes that a United States Senator can afford to be illiterate, and that, though he is laughed at, his political prestige and glory will remain untarnished. But it is with the nine words printed in italics that I am now to deal. From every one of the Stewart bills these nine words have been excluded. They have not been absent by accident, for three years ago I directed attention in your pages to the fact that he was trying to get rid of them. If he succeeds in getting a law passed with these words stricken out, he and his kind of mining attorneys will be great gainers, and honest prospectors will be corresponding losers. I defy Mr. Stewart to offer a single mining reason for rejecting them. Any prospector of fair intelligence can so describe a lode he has discovered, relatively to a canyon, ridge, hill or spring near by, that it will be anchored securely to a spot. The law does not admit of the use of a natural object a mile or two away, for, the distance in that case being only guessed at, there can be no accurate identification of the ground by reference to it.

How is the position of a mining claim to be identified under the Stewart bill? Since natural objects are not made use of, any fanciful description an unprincipled locator might choose to give, relatively to changeable cow trails, to growing trees soon to be cut down, far-away creeks, buttes or towns, would serve his purpose for subsequent "floating" purposes.

HOW THE PRESENT LAW WORKS.

The following is a copy of a mining-location notice made use of in this district, only the names being changed:

"Having on the date hereof discovered the outcrop of a

mineral lode in place, situate and lying in the main fork of Webster canyon, about 200 feet above the cascade spring, the undersigned hereby locates and claims fifteen hundred linear feet thereon, under the name of the Rockford lode and mine. The claim extends 500 feet north, magnetic meridian, and 1000 feet south from the discovery monument, which stands on the croppings 60 feet south of the bed of the canyon. The locator claims 600 feet in width, and has placed the end-center and corner monuments of the lode on lines at right angles to its apparent course."

A lode located under such a notice as the above is a fixture. Where a canyon has no name, it must be named, and, once being known, any person can go to the discovery monument.

In view of the recent decision by ex-Secretary of the Interior Noble as to the importance of an actual discovery being announced in the location notice of a lode, the claimant of mineral ground must henceforward know just what he is doing, or he may find a cloud on his title. On Mr. Noble's decision, however, I hope ere long to have something to say in your pages.

A "FLOATING" LOCATION EXAMPLE.

If Senator Stewart succeeds in making piratical locations as effective in coming years as they were under the law of 1866, the following descriptive matter taken from a "jumper's" location notice, made use of in this camp on January 1st, will be the very thing he needs: "This claim is situated in the Dos Cabezas mountains, about 3½ miles northerly from the town of Dos Cabezas, and 1½ miles southeasterly from the Two Peaks."

Under the law of 1872, a lode claimed as above is void, from indefiniteness of description. The distances given are far from being accurate, but for moveable purposes they would meet the needs of the Stewart bill exactly. The "description" is such as would "identify the claim"—that is, it would prove that the claim existed on a given mountain slope. If opposing parties showed by actual measurements that the distances stated were thousands of feet wrong, the plea would be that the Stewart law did not require absolute accuracy. The "identity" of the claim would next be proved by any necessary amount of lying testimony, and the lode of some unsuspecting prospector half a mile away from the location, made for "floating" purposes, would be taken from him.

WHO WOULD BE HURT

If the nine words, now excluded from, were added to the Stewart bill? The honest prospector would not be hurt by their being present, but the half-starved mining lawyers of low moral fiber, for whom the Nevada Senator is legislating, would continue to suffer if his deep-laid plan of legalized rapine fell through. And fall through it must, or the prospectors and miners of the country will make Mr. William M. Stewart a very sick legislator. He will do well to halt at once.

THE LAW IN FORCE NEEDS TO BE CHANGED.

While the Stewart mining bill professes to amend defects in the law of 1872, it is a sham measure from beginning to end. Its author shows his ignorance of the practical working of the law he pretends to make better. The worst defect of the law now in force is in Sec. 2320. After stating that a claim may be fifteen hundred feet in length, it says "but no location of a mining claim shall be made until the discovery of the vein or lode within the limits of the claim located."

The utter indefiniteness of the words quoted may be shown by asking a few questions: (1.) How far inside of the limits of the claim located must the discovery be? Will six inches inside be enough? Or must 60 feet be aimed at? Or will 600 feet be the regulation distance? Who knows? (2.) What kind of a vein or lode must be discovered to make the location valid? As practice goes, and has gone for 40 years, is not a solid bunch of ore as big as a man's hand, appearing on the surface, but fast at its roots to some other ore-body, a veritable "discovery"? If it is a discovery, what work does the law require the discoverer to do before the validity of his claim is assured? Who can tell? (3.) What relation must the discovered vein bear to the longitudinal line of the staked-out claim? The law itself is silent. There is the fiction of a lode running lengthwise of the location, but it is only fiction so far as the statute is concerned.

Many other questions might be asked in respect to the section indicated, but these are enough to prove how very crude and inadequate it is as the foundation on which a mining title is to be built. Yet in all of the Stewart mining bills there has not been a single attempt made to do away with the absurd incongruities of that part of the existing law.

CLOSING REMARKS.

The Stewart bill, if it becomes a law, will not check the relocating of mining claims. The change of the assessment year from January to October is good as far as it goes, but, as compared to other amendments required, it is only of third-rate importance. His town-site entry section would be good provided that a mine-owner, or several owners, were permitted to lay out a called-for town near their claims. Small mining towns or villages cannot be judiciously incorporated, and hence they will be excluded from the benefits of a really good measure. It will be noticed that I give Mr. Stewart credit wherever I think him entitled to it.

The drift miners ought to have a law suited to their needs, and the petroleum interest should not be overlooked. If our mining laws must be amended, let the proposed changes be laid before the mining community for consideration and emendation; but a man like Senator Stewart, who does not see the worst defects of the present enactment, is incapable of removing them. In December next the Senator is sure to give us another mining bill hash.

He will want free advertising again without limit. If I should have to "go for him" then, I will find some means of piercing his thick political hide that will make him wince.

JOHN DARE EMERSLEY.

Dos Cabezas, Cochise Co., Ariz., March 9, 1893.

California Wild Fruits, Nuts, Etc.

TO THE EDITOR:—Some of the wild fruits of California are very valuable, and well worthy of cultivation; but, strange to state, they have received very little attention by California horticulturists. This is occasioned, no doubt, by their being overshadowed by more profitable varieties of domestic fruits. It is to be hoped, in the near future, that some of the most superior varieties of wild fruits will be extensively tried. No doubt they can also be greatly improved by careful breeding and selection of the fittest. Some of California's shrubs and bushes are especially valuable for ornamental purposes, as well as for their yield of fruit. The following varieties, I think, are well worthy of notice:

The California wild gooseberry, red variety (*Ribes menziesii*), is certainly a desirable variety, and is said to be superior to crabapples for jellies, etc. The plant is exceedingly ornamental when loaded with its reddish-gold fruit. There is a yellow variety similar to the red one. *Ribes divaricatum*, a thornless gooseberry, is also a superior variety.

The California wild blackberry (*Rubus usinus*) flourishes in luxuriant profusion in the warmer portions of the State, especially among tules and on river-banks, etc. I do not think that they are as prolific as the common, cultivated varieties, but they are very valuable nevertheless.

Sierra black currant (*Ribes sanguinem*) is a shrub growing from 4 to 10 feet high, with pink and white blossoms, which are very attractive and fragrant. The fruit is black when ripe, covered with a faint, whitish bloom, and is very sweet, and may no doubt answer the purpose of any currant. It is extremely hardy, and adapts itself to many uncertain localities. There are a number of varieties of this Sierra black currant.

California thimbleberry (*Rubus nutkanus*) is a shrub growing from 3 to 6 feet high, has a large, white bloom, somewhat fragrant; fruit is a scarlet red when ripe, of fine flavor and taste, but would hardly pay to cultivate, I think.

California wild raspberry (*Rubus leucodermis*) grows in trailing vines, somewhat like the common dewberry. The berries are highly aromatic, with a decided tartish flavor. There are three varieties that I know of—the red, yellow and reddish-black. This latter has a fruit shaped like an acorn. These wild raspberries may be valuable to cultivate.

Sierra huckleberry (*Vaccinium ovatum*) is a low-growing, evergreen shrub, generally occupying wet, marshy places; fruit is green and reddish-black. I do not know whether it will ever pay to cultivate.

Oregon grape (*Berberis repens*) is a low-growing shrub of about a foot in height. Fruit is dark-blue. The roots of this plant are extremely valuable as a medicine for chills and fevers. The wood is also an orange-yellow, and, if I am correctly informed, capable of being highly polished.

Elderberry (*Sambucus glauca*) is a rapid-growing bush, from 4 to 15 to 20 feet high; blossoms are white; the fruit is reddish-black when ripe, covered with a faint, powdery bloom, and is very valuable for jams, jellies, wines, etc.

Wild grape (*Vitis Californica*), a very hardy grape, and adapting itself to a great variety of soils and climates; the grapes are small in size, with a high, musky flavor; bunches small and compact.

River grape is a variety of large size, with a musky, agreeable flavor; bunches are large and straggling; they would no doubt pay to cultivate.

Wild cherry (*Prunus demissa*) grows 2 to 12 feet high; fruit is black; may be of value for medical purposes. There are three other varieties in California. The Alpine cherry is a native of a high elevation, has small, willowy leaves, and the bark somewhat resembles the common cherry tree. The trees sometimes attain five and six inches in diameter and from 10 to 25 feet in height. The cherries of the Alpine variety are very highly colored, intensely bitter and unfit to eat; the trees are immense bearers.

Unnamed variety, that resembles the *cascara sagrada* in bark and foliage, is a native of the upper ranges; cherries are dark-black, of fair size, and a strange aromatic flavor; may be of great value for several purposes; cherries ripen in October. I have seen trees of this variety fairly breaking with their immense loads of glossy, black fruit. This cherry, I think, is closely related to *Prunus Besseyi*, the dwarf Rocky mountain cherry, which is much prized for its immense yield of superior fruit.

Evergreen cherry (*Prunus ilicifolia*) grows from 8 to 12 feet high; the fruit is red or dark purple and of a large size.

Wild strawberries.—All the wild strawberries of California belong to the Alpine variety, and, therefore, are mostly everbearing. There is a great number of varieties, some of which will pay well to cultivate. As I have made quite a study of the California wild strawberries, I know whereof I speak. I think they would be an excellent stock for crossing with larger varieties of common strawberries. For sweetness and fine flavor, these California strawberries are unrivaled, and these desirable traits or qualities, I think, could be perpetuated. California Alpine strawberries are extremely hardy, growing in many different soils and altitudes. The following is a list of a few that I have tested the last season. I have a great many more varieties, but cannot report definitely until next season.

Chilensis (*Fragaria Chilensis*) is said to be identical to the Chilean species of wild strawberries. The leaves of this variety are very large, blossom yellowish white and perfect; fruit small, but of excellent flavor, reddish white in color, everbearing; its value not yet proved.

California Alpine (*Fragaria Californica*) has very small leaves. I have not succeeded in making it bloom yet and therefore cannot speak of its fruit.

Red and Gold Alpine—Remarkable for the symmetry and shape of its leaves. The runners and stems of this variety are red, which makes it sort of an ornamental plant; productiveness and value not yet proved. I obtained the plants too late to give any definite idea of their value.

Honey Strawberry (*Red Alpine*) is identical to a Swiss variety; is of great value to cultivate; berries small to medium size, of an exquisite flavor, and a glowing red in

color; immensely productive, blossom perfect, a very hardy strawberry.

Mill City Alpine I think will also be of great value to cultivate; berries small to medium size, beautifully colored, and the finest flavored of any strawberry that I know of. The fruit stalks of this variety resemble the Honey strawberry, except the fruit is round in shape.

California Green Alpine is a medium-sized berry, of fine color and flavor; its value not yet proved.

I have taken up wild strawberry plants from a great many patches in the upper Sierras and next season I may bring to light several other choice varieties.

Wild Plums.—How many varieties there are it is hard to state. I had hoped this year to learn more of this valuable fruit, but being an off year in the fruiting line I learned nothing. There are varieties that I am certain it will pay to cultivate. A fruit-grower in Northern California states that in early times he bought a variety of wild plum from the Indians that was superior to the well-known French prune. This plum is no doubt one of the yellow varieties, which are said to be very sweet and edible and which inhabit the granite formations of the middle regions of the Sierras. The *Prunus subcordata*, or common red wild plum of the Sierras, grows from 4 to 12 feet high. The fruit is small, highly colored and somewhat bitterish in taste.

Sierra Hazel (*Corylus*) is a bush growing from 8 to 20 feet high; the nuts are greatly prized by all persons. Sierra hazel nuts are larger than the Eastern variety.

Sierra Nutmeg (*Torreya*).—Of great beauty as an ornamental tree. The foliage is silvery, bluish green; it yields a nut said to be similar to the nutmeg of commerce. The heart wood of this tree is golden yellow and is capable of being highly polished; the wood is also possessed of a spicy, nameless fragrance and is also very durable. Trees of this variety sometimes attain a height of 50 or 60 feet, and 18 inches in diameter.

Sierra Yew tree (*Taxus*) is an exquisitely beautiful tree; the foliage is dark green; it yields a small, reddish, bell-shaped fruit, very delicious to eat; the fruit ripens from September to November. The wood of the Yew tree is very hard and of great value for many purposes.

Sierra Strawberry tree (probably belongs to or is related to the *Euonymus*) is a tree of surpassing and wondrous beauty. In the fall the leaves all drop off and the tree is fairly breaking with large-sized, glowing, red berries—so red that they almost sparkle in the light. The bark is mottled and of a beautiful chocolate color. It is by far the most beautiful of all trees in the Sierras, or possibly in the world. This wonderful tree is seldom met with in the Sierras. I only know of three or four trees, and they are in very isolated localities and growing at a very high elevation.

Chinquapin, a dwarf chestnut, is generally found inhabiting the higher ranges; the nuts are small and inferior, but no doubt can be greatly improved by cultivation. Botanical name of Chinquapin, (*Castanopsis Chrysophylla*).

California Holly or Toyon (*Heteromeles arbutifolia*) is a valuable ornamental bush; leaves are a light, shining green; the blossoms are small and whitish green in color, and are much liked by honey bees on account of their large secretion of nectar. In the fall of the year the holly is loaded with bright red berries, which are much prized for decorative purposes.

Madroña (*Arbutus menziesii*) is a rapid-growing, beautiful tree, of reddish chocolate-colored bark, and extremely pretty, dark green leaves; the tree is an evergreen; in the fall large trees are covered with bunches of glowing red berries, which forms quite a contrast to the dark green leaves. The blossoms of this tree are also much liked by bees.

Sugar Pine (*Pinus Lambertini*) is without doubt the most valuable lumber tree in the world. It is a soft, easy lumber to work, durable and non-checking; it yields a sugar, valuable for its laxative qualities, and also furnishes a very good, edible nut. The sugar pine most frequently inhabits the lofty ridge-top of the upper Sierras. It is easily recognized from its neighbors by its heavy, sturdy limbs and its long yellow cones, which depend gracefully from the ends of the limbs.

Nut Pine (*Pinus Sabiniana*) also yields a desirable nut. This tree generally inhabits the foot-hill regions and is recognized by its silvery-gray foliage and its loose, tropical appearance. S. L. WATKINS.

Grizzly Flats, March 8, 1893.

Ancient Water Conduits.

In the reign of the Roman Emperor Nero, Rome was supplied by no fewer than nine large conduits, having an aggregate length of 255 miles, which delivered over 173,000,000 gallons daily. Afterwards the supply was increased to 312,500,000 gallons daily, equal to the rate of 325 gallons to each inhabitant. The Aqua Marcia conduit, which alone supplied the drinking water, was 16 feet in diameter and 40 miles long. One of the principal aqueducts it crossed is remarkable for the grandeur of its dimensions and for the skillfulness of its construction. It had to sustain three large conduits, the Julia, Sepula and the Aqua Marcia, and the greatest precaution was exercised to prevent the first two thus draining into the lower one, and from deteriorating its waters. Strabo, in alluding to the skill of the Romans in the application of hydraulics, remarks that not only were there subterranean conduits at Rome, but that all the houses had siphons or water pipes, which probably could be used to extinguish accidental fires.

They drained the Pontine marshes, and so improved the river system that, according to their historians, there was no river in Italy that was not made useful for the purpose of commerce and the transport of troops and provisions. Not content with thus developing the resources of their own country, they studied, wherever victory led the way, to improve the condition of the vanquished by similar public works. They constructed a series of large reservoirs along the range of the hills nearly bordering on the Black Sea, from which they supplied large covered cisterns in

Constantinople with a pure and constant stream of water. In France they constructed conduits to supply Lyons, Fiejus, Sony, Metz and Nismes. The first, owing to the boldness of conception, and the skillfulness of its construction, because it is one of the first known instances of the use of metal pipes subjected to any great pressure, is worthy of more than passing notice. It was designed especially for the purpose of supplying the palace of Claudius, situated in the highest part of the town.

The Nismes conduit, constructed in the time of Augustus, B. C. 19, which delivered 14,000,000 gallons daily, is celebrated for a magnificent aqueduct called the Pont du Garn. Humble describes it as one of the grandest monuments the Romans have in France or any other country.

Again, in Spain and Portugal they supplied the towns of Segovia, Seville, Evora and Lisbon by means of conduits of considerable length, which crossed deep valleys on aqueducts of great magnitude, which, however, present no very remarkable features worthy of further comment.—Fire and Water.

Neglect of the Mining Industry in California.

SAN FRANCISCO, March 14, 1893.

TO THE EDITOR:—After an absence of a few years, I return here to find a most surprising condition of things, so far as relates to what was, when I left, the most engrossing and prominent interest of the State. It is unnecessary to say I allude to mining. I do not remember hearing the subject mentioned for several months after my return, and so far as the discussion of the subject goes, I have heard so little that I can hardly realize that I am living in a community whose interests are so identified with this important industry. I hear plenty of talk about hard times and dull business, but as I say, I hear no earnest talk about the development of the enterprise of mining, which has hitherto been the prosperity and wealth of the State, while as we know, there are yet as good opportunities for profitable mining as ever before. It would seem, however, that everybody wants some other fellow to take all the risk and do the work. This apathy and indifference to the development of such an important industry is one of the causes and result of the so-called hard times, although judging from the magnificent buildings going up on all sides, there must be plenty of money somewhere, it is certain that the whole community is not dead-broke.

Mining is one of, if not the most important industries of this State, and yet it seems to be ignored, while there are, as is well-known, millions of dollars in the ground and rocks, awaiting the miner who is idle for want of the capital to set him to work.

The answer to all applications for this capital is, "oh, mining is so uncertain and risky." Suppose such a sentiment had prevailed in the past, would this city have been what it is to-day? The miner's pick has built these magnificent blocks of buildings and palatial residences, not agriculture. If we had to depend on that industry alone, the wealth and population of this city would have made a very poor showing by comparison. As to the risks of mining, what business has not its risks and liabilities to failure? How many enterprises in so-called legitimate business are successful? We know from experience and statistics, that the percentage of success in mining is fully equal to that of any other kind of business where the same amount of capital is invested, almost any kind, to be successful requires practical experience. It is the same in mining. It is a trade or calling to which an abundance of men have served an apprenticeship and are skillful, so there is no excuse on that head.

While the people of this State are so apathetic and indifferent to the wealth within its borders, those of our surrounding States and territories are wide-awake to the profits and advantages of mining, Montana, Colorado, Idaho, Arizona, are pushing mining enterprises, and capital is flowing in, new towns are springing up, new camps are established, population is increasing, while ours is decreasing. The whole interest of the community seems to be centered on the question of establishing of a new line of steamers, or moving the Capitol. The idea seems to be that with cheaper freights prosperity will follow. It may make goods cheaper but will that fact remedy the evil? Will it give employment to the vast number of idle men who are begging for work?

The true remedy for the dull times complained of, is, to open and work our mines. The savings banks are overloaded with money, capitalists have thousands of dollars lying idle, seeking investment, but not a dollar for mining; and yet we wonder that capitalists of the east do not invest in our mines. We certainly do not set them an example of confidence in the enterprise, and they say, why do you ask us to buy your mines and put in our money, when you do not invest your own?

We have but ourselves to blame for dull times. The fact is, we are fast losing our boasted enterprise. We are losing our energy, and early day "push," getting to be dull and hum-drum. The capitalist won't invest again the money he made out of the mines, and those who would, have none to invest. While we are droning along and grumbling at the dullness of business our enterprising neighbors are pushing their mines, building railroads and cutting off our trade north and south. We have gone to sleep; some day we will awake Rip Van Winkle like, and discover that we have sunk into insignificance, while we have within our borders every element of wealth and prosperity, and prominently so our mines, containing millions which we are too lazy and indifferent to take out, while we grumble and whine over the decay of prosperity.

OLD CALIFORNIAN.

Freak of an Artesian Well.

Messrs. Bennett & Taylor recently drilled a well for Mr. Wm. Duncan, on his sister's (Mrs. T. S. Brown's) place back of the Oak Glen Cottage property, says the *Nordhoff Ojai*. The well was put down 388 feet, and while an abundance of good water was found, there was no flow, which

fact puzzled Mr. Ezra Taylor, who has charge of the drilling business, as he felt pretty sure of striking a flow there. The well was put down farther than any around here, because he hoped each hour to make a "strike." But the effort was abandoned when the pipe was down 388 feet and a pump put in.

During the last storm the well was transformed into a gusher, and ever since has been sending an inch and a half stream up through the pump valve. Mr. Taylor will remove the pump and thinks that then the flow will be materially increased. Now every one is at liberty to guess whether or not the flow will be permanent; but it would be intensely interesting to be able to look at the cave of earth that probably took place at the end of the pipe, thus making a vent for the big underground stream that is rushing across the Ojai Valley.

"Machine" Mining in Wyoming.

The Cambria coal mines are located in the State of Wyoming, on the Burlington & Missouri River R. R., and at the southwestern border of the celebrated Black Hills. They are situated beneath a broad plateau, about 5500 feet above the sea, the vein averaging seven feet thick of fine bituminous coal. While this vein contains some impurities, those can be easily removed in the mining, leaving a steam and coking coal unequalled on this side of the Atlantic. These mines are what are known as "drift mines," being entered from the side hill. They are two in number—Antelope and Jumbo—the former being on the west side of the canyon, with an elevation of 40 feet above the railroad tracks, the latter being on the east side at an elevation of 70 feet. The coal from both mines is delivered at a common tippie in the middle of the canyon. The coal is brought out by the tail-rope system of haulage. The chute, where the railway cars are loaded, contains the finest of machinery for crushing, screening, elevating and conveying the different grades of coal to any desired point of delivery, the customer being thus enabled to procure, at pleasure, any size or grade of coal desired. The method is thus described by a correspondent of the *Coal Trade Journal*:

"The mining is done exclusively by machinery, the power used being compressed air, which is conveyed into the workings by means of pipes and air-receivers, supplied from the power-house located on the outside. The Jeffrey mining machines are used in connection with the Jeffrey giant air-power coal drill. There are three compressors, kept running night and day, year in and year out, which were built by the Norwalk Iron Works Co. An electric plant furnishes light for the mines, as well as for the buildings connected with the mines. Eleven steam boilers, with a capacity of 800-horse power, and which will shortly be increased to 1200, drive the machinery. A finely equipped blacksmith and machine-shop keeps up all needed repairs.

"Having had charge of the Cambria mines for a year past, and being well acquainted with all the large machine mines in the United States—in fact, having had charge of the development of many of them and having visited most of the others—I have no hesitation in saying that the mines at this place are the most extensive in the United States where the entire output is the result of machine-mining. Although these mines have been opened only about three years, they already have a capacity of from 1600 to 1800 tons daily, which capacity will surely be doubled before the end of 1893. The mines are distant several hundred miles from any other coal fields, and the Cambria proprietors are practically without competition. Had it not been for the existence of this coal, the railroad before named would not have been built, owing to the want of proper fuel with which to operate it.

"As the principal part of the mining is done by machinery, unskilled workmen have here a rare opportunity for remunerative employment. More than this, there naturally cannot be, under a system of mining like this, that great variance in the wages of the different employes which is naturally so productive of discontent and consequent strikes. The company has a plant of coke ovens, by which a good article of coke is made from the fine slack taken from the coal by the screens. The slack, which enters into this coke, requires no treatment other than screening to fit it for use, though experts say that the product could be improved by a system of washing.

"As I have before remarked, these mines are at the southwestern border of the Black Hills—a fact of great moment when one comes to estimate the value of the plant. It is my opinion that 1,000,000 tons of coal can be taken from this field annually for 75 or 80 years without exhausting the supply of coal.

"Since the commencement of this enterprise, every move has been toward the betterment of the condition of the workmen. Thus, two fine hotels, with 360-person capacity, and also 100 neat dwellings, have been erected for their use. In addition, the proprietors have been to the expense of putting up a schoolhouse, church, hospital and other buildings for the laborers' convenience and comfort. Added to all this, there are fine offices and extensive stores, so that this is a veritable city, filled with fully 400 of the best paid, most prosperous and truly contented workmen to be found on the face of the earth."

Hydraulic Mining Pump.

The London *Colliery Guardian* thus describes Joseph Moore's patent hydraulic pumping arrangement: "Two columns of water are substituted for the ordinary pump-ropes connecting the steam engine with the pump, which may be placed any distance from each other. Advantage is taken of the fact of water being practically incompressible, and that if a pipe is filled with water a piston at one end will, if pushed forward, propel a piston placed at the other end in the same direction. With two pipes and four pistons a reciprocating motion is obtained. The arrangement consists of a hydraulic cylinder in which works a piston or ram, called the power ram, which is moved by a crank driven by a steam engine. At the pump there a cyl-

inder exactly the same as that at the engine, in which is a piston or ram attached to the plunger of a double-acting pump. A pipe connects the end of the power cylinder at the engine with the end of the motor cylinder at the pump. When both cylinders and pipes are filled with water and the water piston is moved by the engine, the water in the power cylinder is forced through the pipe into the end of the motor cylinder at the pump, and the motor piston is moved. In a like manner when the power ram at the engine moves, that at the pump responds, carrying the pump plunger with it. In this way the pump plunger is moved backward and forward in the same way as if there had been a direct connection by means of rods between the steam engine and the pump. Arrangements are made to provide for leakages, every adjustment is automatic, and in practice they are found to work satisfactorily. A complete plant has been erected at the Linlithgow Oil Co.'s Champfleurie mines. The pump lifts 93 fathoms vertically, is double-acting, 12 inches in diameter, with four feet stroke, and discharges 300 gallons per minute. The pressure of the water in the lower pipes is about 2000 pounds per square inch. At Balquhastone colliery, Slamannan, there are two sets of double-acting 12-inch pumps, worked by one geared engine, raising 600 gallons a minute from the bottom of a shaft 65 fathoms deep. The driving cranks for the surface power rams are fixed at right angles, so that the engine is balanced. This arrangement is found to work very well, and several plants have been fitted up on this plan. The system of pumping described by the writer has been applied for sinking purposes, a pump having been used for raising 300 to 500 gallons per minute during the sinking of a shaft 100 fathoms deep. The steam engines employed for working these pumps may be either direct-acting or geared, as may be found most convenient. Usually the engines are geared and in the proportion of six to one; a pump worked on this system gave a useful effect of 68 per cent, with a distance of 800 yards between the engine and the pump; another pump gave 66 per cent of efficiency."

A Boundary Line Survey.

It has been ascertained that in the boundary survey between Alaska and British Columbia several parties will be placed on the mainland bordering the archipelago Alexander. Some of the parties are Canadians and several are detailed by Superintendent Mendenhall of the United States Coast and Geodetic Survey. This part of the boundary line is by treaty within 30 miles or less of the continental shore, as Vancouver expressed it. There will be triangulation and astronomical parties on the rivers Taku, Stickeen and Unuk, and one in Holkham bay, and one, an astronomical party, at Sitka. The chiefs of the Canadian parties are not known. Those of the United States are Messrs. Ogden, Tittmann, Dickens, McGrath, Turner and Morse. The last named will be stationed at Sitka.

Each Canadian party will have a United States assistant attached to it, and each United States party will have a Canadian officer attached to it. This is the usual arrangement in such international investigations.

The men for the coast survey parties will be taken from Puget Sound and San Francisco. The work will be very rough and progress cannot be very rapid. The rivers are either masked by glaciers or have great glaciers projecting into them from the sides of the gorges. The mountains rise from 3000 to 5000 feet above the sea level, and the seaboard flanks are covered with dense forests and undergrowth to about the 2500-foot elevation. The coast line must be very irregular, and along that the boundary line runs when within 30 miles of the shore.

The coast survey steamer *Hassler*, Captain Harber, will be engaged during the working season in connecting the astronomical stations of the foregoing parties with Sitka for distance of longitude by chronometers. This standard station was determined by Professor Davidson in 1867, and observations have been made through many seasons since, so that the longitude is well determined.

THE old sectional docks at Mare Island Navy Yard were sold this week for \$5,031. The purchasers have twenty days in which to remove the docks, and they cannot say whether they will break them up or take them to Oakland to be used for docking vessels there until the exact condition of the docks is ascertained. It is said there are 120 tons of iron in sight about the docks, not to mention the great anchors and chains that hold them in place. The sectional docks were the first of the kind built on the Pacific Coast and were begun in 1852. They were composed of eleven sections, each 130 feet high and 33 feet wide. The extreme length of the structure was 325 feet, and it was capable of accommodating a vessel of 3,000 tone burden. When the stone dry-dock at the Navy Yard was finished, the sectional docks were abandoned.

THE new wharf of the Southern Pacific Company at Santa Monica will be 4600 feet long, and 3100 feet have been completed. For 1500 feet of the length there will be 34 feet of water at low tide. The outer portion will be 131 feet wide and will hold 7 tracks. A coal bunker to hold 8200 tons is to be built. In the construction of the wharf creosoted piles and Oregon pine lumber are being used, and when it is ready for use the company will practically abandon its terminal at San Pedro, which it has used for a number of years past and which has been the port for all of the sea shipments of Los Angeles and its immediate vicinity. All lighterage will be done away with by the change.

THE *Ferguson Lode* will hereafter be published at Pioche, Nev. The entire bottom having apparently fallen out of the Monkey Wrench country for the present, makes a change of base necessary.

THE *Amador Record* has closed its first volume. This is one of the mountain papers that keeps track of local mining news so that people outside of the county can know what is going on.

The New Game Law.

The amended Emeric game law has passed and is now the law. The following are its provisions:

SECTION 1. Section 626 of the Penal Code of the State of California is hereby amended to read as follows: Every person who, in the State of California, between the 1st day of March and the 1st day of September in each year shall hunt, pursue, take, kill or destroy, or have in his possession, dead or alive, except for purposes of propagation, any quail, bob-white, partridge or grouse, or any kind of wild duck, snipe or rail, shall be guilty of a misdemeanor.

Every person who, in the State of California, shall take, gather or destroy the eggs of any quail, bob-white, partridge, pheasant, grouse or dove, or any kind of wild duck, shall be guilty of a misdemeanor.

Every person who, in the State of California, between the 1st day of March and the 1st day of August, in each year, shall hunt, pursue, take, kill or destroy, or have in his possession doves, shall be guilty of a misdemeanor.

Every person who, in the State of California shall, within the two years next (except from September 1st to October 15th in each year) after the passage of this Act, hunt, pursue, take, kill or destroy any male deer, elk, antelope, mountain sheep or buck, shall be guilty of a misdemeanor.

Every person who, in the State of California, shall at any time hunt, pursue, kill, take or destroy any female deer, antelope, elk, mountain sheep or doe shall be guilty of a misdemeanor.

Every person who shall at any time hunt, pursue, take, kill or destroy any spotted fawn shall be guilty of a misdemeanor.

Every person who shall take, kill or destroy at any time any bird mentioned in this Section, unless the carcass of such bird is used or preserved by the person so taking or slaying it, or is sold for food, shall be guilty of a misdemeanor.

Every person in the State of California who shall at any time sell, or offer for sale, the hide or meat of any deer, elk, antelope or mountain sheep, shall be guilty of a misdemeanor.

Every person who shall buy, sell, offer, or expose for sale, transport or carry, or have in his possession any deer or deer-skin, or any deer hide or pelt from which the evidence of sex has been removed, or any of the aforesaid game at a time when it is unlawful to kill the same, shall be guilty of a misdemeanor.

Every person who, in the State of California, shall, within the two years next after the passage of this Act, hunt, pursue, take, kill or destroy or have in his possession, except for purposes of propagation, any pheasant, shall be guilty of a misdemeanor.

Every person who shall, at any time, net or pound any quail, partridge or grouse, and every person who shall sell, transport, or give away, or offer or expose for sale, or have in his possession any quail, partridge or grouse that has been snared, captured or taken in or by any means of any net or pound, is guilty of a misdemeanor.

Proof of possession of any quail, partridge or grouse, which shall not show evidence of having been taken by means other than a net or pound, shall be "prima facie" evidence in any prosecution for violation of the provisions of this Section, that the person in whose possession such quail, partridge or grouse is found took, killed or destroyed the same by means of a net or pound.

Every cold-storage company, person keeping a cold-storage warehouse, tavern or hotel-keeper, restaurant or eating-house keeper, marketman or other person who shall sell, expose or offer for sale, or give away, or have in his possession in this State any deer, quail, bob-white, partridge, pheasant, grouse, dove or wild duck during the time it shall be unlawful to kill such animal or bird shall be guilty of a misdemeanor.

Every person who shall use a shotgun of a larger caliber than that commonly known and designated as No. 10 gauge, for the purpose of killing or destroying any wild duck, rail, quail, partridge, pheasant or grouse, shall be guilty of a misdemeanor.

Every person who, upon any inclosed cultivated grounds which are private property, and where signs are displayed forbidding such shooting, shall shoot any quail, bob-white, pheasant, partridge, grouse, dove or wild duck, without permission first obtained from the owner or person in possession of such grounds, shall be guilty of a misdemeanor.

Any person found guilty of a violation of any of the provisions of this Section, shall be fined in a sum not less than \$20, or be imprisoned in the county jail in the county in which the conviction shall be had not less than ten days, or be punished by both such fine and imprisonment. One-half of all moneys collected for fines for violations of this section shall be paid to the informer, one-quarter to the district attorney of the county, and one-quarter shall be paid into the Fish Commission fund for the purchase and distribution of game birds in the various counties of the State.

SEC. 2. All Acts and parts of Acts in conflict with this Act are hereby repealed.

SEC. 3. This Act shall take effect and be in force from and after its passage.

THE proposition to build an electric road between Kern City and Bakersfield is assuming definite proportions, and the scheme will be developed and the road constructed within the next five months, if at all. Samuel H. Taylor, representing the Westinghouse Electric and Manufacturing Company, has been engaged with the projectors of the enterprise, in looking over the proposed route, on which he has given an estimate of the cost of construction and other important details. The Westinghouse system will be utilized. The power plant will be located at the East Side Canal drop, which has a capacity of 100-horse power. The road will be two and a half miles long.

LIEBER'S ASSAYER'S GUIDE.

A New, Revised and Enlarged Edition of a very popular book.

JUST READY.

Assayer's Guide; or Practical Directions to Assayers, Miners and Smelters, for the Tests and Assays, by Heat and by Wet Processes, of the Ores of all the principal Metals, of Gold and Silver Coins and Alloys, and of Coal, etc. By Oscar M. Lieber, Late Oecologist to the State of Mississippi. A new, revised and enlarged edition, illustrated by numerous engravings. In one volume, 12mo, 243 pages, price \$1.50 by mail, free of postage to any address in the world.

CONTENTS: Introduction. I. Description of the implements and Utensils used in the Course of Assays by Heat. II. Reagents used in Assaying. III. Assay of Silver Ores by Heat Cupellation. IV. A Table to Rectify the Loss Incurred during the Silver Assay. V. Gay-Lussac's Process for Assaying Silver Alloys. VI. Assay of Native Silver Ores. VII. Assay of Gold Ores by Heat. VIII. Assay of Gold Ores by Amalgamation. IX. Assay of Gold by Washing. X. Assay of Gold by Panning. XI. Assay of Gold by Combined Dry and Wet Methods. XII. Assay of Gold Ores by a Wet Process. XIII. Assay of Silver Coins, or Alloys of Silver and Copper. XIV. Assay of Gold Coins, or Alloys Containing Gold, Silver and Copper. XV. To find the Proportion of Gold in a Mixture of Gold and Quartz by Calculation. XVI. Assay of Platinum Ores. XVII. Assay of Copper Ores—German and Hungarian Methods. XVIII. Assay of Copper Ores—English Method. XIX. Wet Assay of Copper. XX. Electrolytic Determination of Copper. XXI. Assay of Lead Ores. XXII. Assay of Lead Ores by Heat. XXIII. Assay of Lead Ores by a Wet Process. XXIV. Gravimetric Analysis of Lead. XXV. Assay of Iron Ores by Heat. XXVI. Fuchs's Process for Iron Ores and Iron. XXVII. Swedish Assay of Iron Ores. XXVIII. Assay of Quicksilver Ores. XXIX. Dry Assay of Tin Ores. XXX. Assay of Sulphurets in Ores. XXXI. Mode of Testing the Calorific Power of Coal and Other Fuels. Index.

Descriptive circular giving the full Table of Contents of the above book sent free to anyone who will furnish us with his address.

A New List of Leading Books on Metal Mining, Metallurgy, Mineralogy, Assaying, Chemical Analysis, Geology, etc., sent free to any one, in any part of the world, who will send his address.

Our new and revised Catalogue of Practical and Scientific Books, 88 pages, 8vo, and our other Catalogues, the whole covering every branch of Science applied to the Arts, sent free and free of postage to any one in any part of the world who will furnish us with his address.

THE ORIENTAL GAS ENGINE

IS THE BEST, because it combines simplicity of construction with power and economy in space. It can be run with natural or manufactured gas or gasoline at a cost of 20 to 25 cents per horse power per day.

It can be used for pumping purposes, as well as for all purposes where a perfect engine is required, with the advantage of lessening the risk of explosion. No licensed engineer at a high salary needed to operate it.

Send for circulars and prices if a good safe engine is what you need.

The Oriental Launch is Perfection.

THE BLASDEL CONCENTRATING BELT COMPANY.

We are now having our new Improved Concentrating Belt manufactured in San Francisco. We keep always on hand Belts suitable for the Triumph and Frue machines, but can make any length or width desired. The advantages of these belts over any others will be readily seen by practical millmen. First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight rifled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. These slight rifles also save very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth. We can safely say that it is a better concentrator belt than has ever been manufactured. It will last much longer and will handle more pulp. We also manufacture smooth belts with same flanges when desired.

Mechanical Progress.

Manufacturing Specialties.

A manufacturer of a line of standard goods, says *Iron Age*, had been complaining of the total lack of profits in his business to a sympathizing friend, when the latter was struck by a brilliant thought and asked: "Why don't you take up a specialty and drop staple articles that everybody is making?" The unexpected reply was: "There is too much competition in specialties themselves." We venture to say that this idea is as new to a majority of our readers as it was to the man who asked the question. But, with comparatively few exceptions, it is too true. The mechanical genius who can at this time devise some novelty which does not come in direct competition with something else capable of doing the same thing or answering the same purpose is a genius indeed. Take small wares, for instance, such as are used in the kitchen. The ingenuity of inventors has been racked to get up numberless devices for beating eggs, for sifting flour for grinding coffee, etc. Appeals are mutely made by every form of apparatus to the housewife's neatness, celerity, mechanical taste or curiosity, but there are so many articles of such totally different kinds warranted to do the same thing precisely in the most satisfactory way that she is bewildered and is as likely to select the least efficient as the best. The same remarks would apply to mechanics' tools, to personal furnishings, to wagon and carriage supplies, to so-called railway specialties, etc. There was a time when labor-saving automatic machinery began to take the place of toilsome hand labor, when a man of acute perception and mechanical knowledge could easily see an opportunity for the invention of a device which would save labor, economize time, cheapen production and perhaps improve the quality and appearance of an article in quite common use, and the practical development of the thought brought him into prominence as a manufacturer of specialties, and perhaps in time made him wealthy, but to-day such opportunities are few. The ground has been pretty thoroughly covered.

Mechanical talent at this time seems to be turning in a totally different direction. The capabilities of machinery having been very thoroughly developed and opportunities for new applications being discouragingly rare, the most notable achievements making seems to be in the direction of cheapening the production of staple articles. This is the keynote of the manufacturers who are now most successful. The search for specialties is not alluring, as specialty competes with specialty, and consumption is perforce limited. In staple articles, however, there is a constant trade. The manufacturer, therefore, who surpasses his fellows in the cheapness with which he can turn out staple articles of equal quality surpasses them also in securing a large share of the trade and better profits. Never before has mechanical genius so applied itself in this country as now to the solution of the question: How shall the cost of production be further decreased by the introduction of more efficient machinery?

New Method of Rolling Old Steel Rails.

In utilizing old steel rails it has generally been customary to split apart the head, neck and base, beat each part separately, and roll the pieces out into small plates. Several western mills have lately adopted a new method of rolling, known as the McCloud process, by which no splitting is necessary. The rails are carefully selected. Only those weighing 56 pounds and upward per yard being used, and cut into pieces from three to six feet long. The pieces are then beaten and passed six times through a set of rolls. On the first pass the base of the rail is bent over to the side, on the next pass it is bent more and the head is somewhat corrugated, on the third pass the rail begins to look somewhat like a plate, and the other passes complete the process. The rolls are so designed that the metal is gradually flattened out without being bent over on itself, which would be highly injurious, since the steel does not weld. The finished plates are about one-quarter of an inch thick, and from eight to ten inches wide, depending on the section of the rail from which they are made. They have been used for a variety of purposes, especially for making wire nails, for which they seem especially suited. The inventor of the process, Sydney McCloud, has also invented another system of rolls for wrapping narrow plates into a bar, which is much stronger than a solid piece of the same size. The reason of this additional strength is to be found in the fact that if the outside layer of metal is broken the inner

layers are intact, and will resist further strain, while in the case of a piece of solid steel the rupture of the skin is fatal. The seams in these wrapped bars are said to be scarcely perceptible to the naked eye, and only appear when the metal is bent over and twisted off, which requires a great amount of force. The advantage of using these wrapped bars under certain conditions will be better understood when it is recalled that steel frequently bears a stronger resemblance to a refined, ductile cast iron than to a fibrous wrought iron, and partakes so largely of the character of cast iron that a small scratch on its surface may cause serious trouble if the piece is solid and exposed to vibratory strains.—American Manufacturer.

A New Mitrailleuse for Cavalry.

A form of mitrailleuse which, owing to its lightness, is said to be peculiarly well adapted for service involving rapid movement has been devised recently by a French artillery officer, and having been submitted to the Minister of War is now being subjected to experimental tests. This arm is intended primarily for the use of Cavalry or for employment in mountainous districts where the transportation of heavier pieces of artillery might be difficult. The inventor claims that his weapon will not impede the movements of cavalry, as each mitrailleuse complete with 2000 rounds of ammunition can be easily carried by one horse.

As a mountain gun the piece can be carried by one man on a framework of wood or metal forming a sort of hod, which is so constructed as to serve as a mount for the gun in action. It is asserted that one artilleryman or properly trained cavalry or infantry soldier can mount the gun ready for use almost instantly and that its service requires but one man.

The new mitrailleuse can fire 600 small-caliber projectiles per minute, equaling the performance of 25 or 30 men, and this can be maintained for a considerable time. Officers who have witnessed the trials executed by direction of the French authorities express the opinion that the use of the new weapon would be extremely advantageous in cases where a cavalry force was suddenly required to hold or attack a position against infantry. Should further tests continue to prove satisfactory the issue of some of these guns to certain cavalry corps is said to be contemplated, in order that they may be subjected to trial under ordinary service conditions.

Lining Mine Shafts.

A new method of lining and curbing shafts and wells has just been brought under our notice, in which blocks of moulded concrete are employed, which form segments of a circle or an oval, varying in size according to the dimensions of the shaft or well, and weighing from 8 to 12 cwt. each. These blocks have at each side a round fluting, with a channel at the top, and a corresponding but smaller semi-cylindrical roll or heading at the bottom; they have also two drill holes, one running vertically and centrally and the other horizontally from back to front at the base. The vertical drill-hole enables a rod with a hook or ring to pass down and be intersected by a bolt running through the horizontal drill-hole, thus holding the rod and supplying the means of hoisting or lowering the blocks into their places. When a complete round of segments is formed (the rocks break joint like ordinary brickwork), the vertical flutings are rammed with a cementing material, and the space between the round and the natural wall of the shaft is packed with concrete. Before laying the next round of blocks, a thin layer of cement is placed in the channel on the top of the blocks beneath, into which the projection of the upper blocks fits, the joints thus becoming perfectly tight and forming a solid lining through which water cannot penetrate. In Germany, it is stated, this system has already proved a success, several colliery shafts in the Saarbrücken district, belonging to the Prussian Government, having been provided with linings in the manner described, with satisfactory results.

HEIGHT OF BUILDINGS.—A revised building ordinance is now before the City Council of Chicago, Ill., says the *Engineering News*, fixing the maximum height of buildings at 160 feet above the sidewalk level. It favors piles for foundations, but does not forbid the use of steel or iron rails. All buildings devoted to the sale, storage or manufacture of merchandise, and all stables which are 100 feet or more high, must be entirely of fireproof construction. Buildings of less than 100 feet and more than 60 feet high must be of slow-burning or mill construction; buildings of less than 60 feet in

height may be of ordinary construction. In Class 2, buildings used as residences for three or more families, hotels, boarding or lodging houses, etc., occupied by 25 or more persons; and all office buildings which are 90 feet or more high, must be entirely of fireproof construction. If less than 90 feet and more than 60 feet, their construction must be slow-burning or mill construction. If they are less than 60 feet in height their construction may be of the ordinary sort. Class 3, all buildings used as residences for one or two families, or for less than 25 persons, may be built of ordinary construction, except if they are 60 feet or more high, they must conform to the limitations fixed for buildings of Class 2. In Class 4, all buildings used as assembly halls for large gatherings, whether for purposes of worship, instruction, or entertainment, must be safely constructed under rigid rules. Height of buildings of non-fireproof construction is estimated from the sidewalk level to the highest point of the roof. It is probable the ordinance will be further revised before finally becoming a law. Such changes as are made will probably be in minor details or verbiage, as the main points have already been fully covered.

Scientific Progress.

Delicacy of a Certain Chemical Test.

One of the most delicate tests known to chemical science is that in which potassium sulpho-cyanide is employed to discover the presence or absence of the element iron in a given solution. Potassium ferro-cyanide is, perhaps, used more frequently, but gives much less satisfactory results. In cases where this salt failed to indicate the slightest trace, the sulpho-cyanide yielded a very evident proof of the presence of the element in question. The observance of this fact led to an attempt to ascertain as nearly as possible the actual value of the sulpho-cyanide as an iron test. The method adopted was very simple. A small quantity of polished iron wire was weighed out very accurately. In the actual process 0.0347 gramme was taken. By considering the density of iron, it was found that this weight occupied a volume equal to 0.004458 cubic centimeter. This quantity of iron was now dissolved in hydrochloric acid and water and oxidized, forming ferric chloride, which was then diluted with a sufficient volume of water to yield a solution of 100 cubic centimeters volume.

This was placed in a burette graduated to one-tenth centimeter, and three-tenths of a centimeter were drawn off, to which the potassium sulpho-cyanide test was applied, which imparted a reddish brown color to the liquid indicating the presence of iron. The solution was then made more dilute and a second portion was tested. The process was continued until only a very faint tinge of red could be detected. A small quantity of water was again added and the test applied, which, however, did not indicate the presence of iron. The quantity of iron which was detected by the sulpho-cyanide on its last successful application was found to be no greater than forty-three one-hundred-millionths of a cubic centimeter, or thirty-three ten-millionths of a gramme. This seems, indeed, to be a wonderfully delicate test, but it is only necessary to call to mind the approximately determined weight of the molecule of iron to be struck with the crudeness and inaccuracy of our most delicate methods of qualitative analysis.

The weight of a molecule of hydrogen, as given by an eminent authority, is approximately 0.000,000,000,000,000,000,04 of a gramme; by multiplying this inconceivably small number by 55, the atomic weight of iron, we ascertain the weight of a molecule of iron—0.000,000,000,000,000,000,002,2 gramme. In the sulpho-cyanide test we were able to detect the presence of thirty-three ten-millionths of a gramme of iron; dividing this number by the weight of one molecule of iron, we find that this apparently delicate test is unable to indicate to our senses a less number of molecules than 1,500,000,000,000,000. When we consider that most of our so-called tests are much less accurate than this, it is evident that in our determinations it is impossible to reach the absolute truth.—Scientific American.

THE LIFE OF CHOLERA BACILLUS IN BEER.—The German savant is eminently practical when it comes to beer, and as soon as the cholera assumed noteworthy proportions in Europe he set about determining the duration of life of the bacillus in his—the savant's—pet beverage. He found, according to the *Pharmaceutische Zeitung*, that the bacillus does not live beyond three hours in Pilsener, Patzenhofer or Munich beer; two hours in Berlin white beer; five

minutes in white and fifteen in red wine, and twenty minutes in cider. Two hours in cold-coffee decoction (6 per cent) was too much for the bacillus; but it needed five hours of a rye-and-chicory imitation to kill it. In milk which had been boiled for an hour the bacilli lived for nine days, but the tenth brought them to the end of their career. Cold tea was much the same—i. e., a 1 per cent brew, but a 2 per cent tea cleared the field in four days, 3 per cent in one day and 4 per cent in an hour. The bacilli were most partial to cocoa; they did not appear to die off in that at all.

What Is Celluloid?

Probably a great majority of the people who have used celluloid these many years have no knowledge of its composition, and never have suspected that it was simply paper, chemically treated, reduced again to pulp, and then molded into its final "form of beauty and utility." The process is not a complicated one. A roll of paper is slowly unwound, being saturated with a mixture of five parts of sulphuric acid and two parts of nitric acid, which falls upon it in a fine spray. This changes the cellulose of the paper into propylin gun cotton. The excess of the acid having been expelled by pressure, the paper is washed with plenty of water till all traces of the acid have been removed. It is then reduced to a pulp and bleached. Most of the water having been got rid of by means of a strainer, the pulp is mixed with 20 to 40 per cent of camphor, and the mixture is thoroughly triturated under mill stones.

The necessary coloring powder having been added, a second mixing and grinding follows. The pulp is then spread out in thin layers on slabs, and from 20 to 25 of these layers are placed in a hydraulic press, separated by blotting paper, and subjected to a pressure of 150 atmospheres, until all traces of moisture have disappeared. The French article differs somewhat from the American, being made from paroxylated paper, treated with alcohol, then mixed with camphor and subjected to pressure, as in the other case. But the French article has the disadvantage that it is susceptible to ignition, and that of a very energetic sort. This usually takes place at about 480° F., but may occur spontaneously at a considerably lower figure. It produces a thick, black smoke but no flame. Paper World.

The Most Explosive Substance.

The most unstable compound known to chemistry, and therefore the most explosive substance so far discovered, is chloride of nitrogen, which probably consists of three parts of chlorine united with one of nitrogen. Its terribly explosive character, which has so far prevented its accurate analysis, is due to the fact that it is a combination of one of the most active with one of the most inert elements in nature. It is a volatile liquid of brownish color and pungent taste, discovered by the French chemist Dulong, who lost an eye and three fingers in the operation. Faraday and Davy experimented on it a few years after its discovery, protecting themselves with glass masks, which were in turn shattered by explosions of minute quantities of the dangerous compound. Faraday was stunned by the disintegration of a few drops which he merely touched with a piece of warm cement. There is but little danger of chloride of nitrogen ever being used for purposes of deliberate destruction, as its preparation on a large scale is practically impossible. Its explosive force is not known, for the reason that any attempt to determine it would probably prove fatal to the experimenters. According to some authorities, the more recently discovered compound of hydrogen and nitrogen, known as azoimide, is even more explosive than chloride of nitrogen, but this substance is still too obscure for a decisive judgment to be formed on the subject.—Pearson's Weekly.

The Bite of a Snake.

The heads of most of the venomous snakes, including the "rattlers," bulge just beyond the neck. Without exception they have fangs, either always erect or raised and laid back at will. These fangs are long, sharp-pointed teeth, with a hollow groove running their entire length. At the root of each fang is a little bag of poison. When the snake bites the motion presses the poison sac, and its contents flow down through the hollow in the tooth into the puncture or wound. The harmless little forked tongue is often spoken of by the uninformed as the snake's "stinger." Now there is no propriety in the name, as the poisonous snakes do not sting, but bite their victims. There is no creature, even if brought from foreign countries where "rattlers" do not exist, but will balt and tremble at the first warning.

Metallurgy and Ores.

**SELBY
SMELTING and LEAD CO.,**
416 Montgomery St., San Francisco

**GOLD AND SILVER REFINERY
And Assay Office.**

Highest Prices Paid for Gold, Silver and
Lead Ores and Sulphurets.

— MANUFACTURERS OF —

LEAD PIPE,
SHEET LEAD,
SHOT, Etc., Etc.**
ALSO MANUFACTURERS OF
Standard Shot-Gun Cartridges.
Under Chamberlin Patent.

JOHN TAYLOR & CO.,
IMPORTERS AND DEALERS IN
**ASSAYERS' MATERIALS, MINE
AND MILL SUPPLIES,**
ALSO CHEMICALS, AND PHYSICAL, SCHOOL AND
CHEMICAL APPARATUS.

68 & 65 First St., cor. Mission, San Francisco
We would call the attention of
Assayers, Chemists, Mining Com-
panies, Milling Companies, Pros-
pectors, etc., to our full stock of
Balances, Furnaces, Muffles, Crucibles, Scor-
ifiers, etc., including, also, a full stock of
Chemicals.
Having been engaged in furnishing these sup-
plies since the first discovery of mines on the
Pacific Coast, we feel confident from our expe-
rience we can well suit the demand for these
goods, both as to quality and price.
Agents for the Morgan Crucible Co.,
Battersea, England. Also for E. G. Dennison's
Silver Plated Amalgam Plates. The plates
of this well-known manufacturer are thoroughly reli-
able, and full weight of Silver guaranteed. Orders taken
at his lowest prices. Our Illustrated Catalogue and As-
say Tables sent free on application.

NEW DISCOVERY.

Mines Revived and Miners Enriched
By the wonderful MacArthur-Forrest Process,
Controlled by the Gold and Silver Extraction Mining
and Milling Co. H. A. W. Tabor, Pres.; LEONARD GOW,
V. Pres.; H. A. Jones, 2d V. Pres.; P. G. GOW, Techni-
cal Mgr. and Asst. Treas.; T. L. WISWALL, Gen'l Mgr.
and Sec'y; PETER MCNEIL, Treas.; W. L. COOPER, Eng.

TRADE MARK.

General Office of Company:
Rooms 8, 9 & 10, Tabor Grand Opera House
Block, DENVER, COLORADO.

Also mills in operation as follows, viz: The Denver Mill,
Denver, Colo.; The Livingstone Gold Mining Co., Boulder
Co., Colo.; The Puzzler Gold Mining and Milling Co.,
Boulder Co., Colo.; The Cripple Creek Gold Extraction
and Power Co., Colo.; Calumet Gold Mining Co., Middle
Creek, Shasta Co., Cal.; The Shasta Gold Ex. Co., Mid-
dle Creek, Shasta Co., Cal.; The Mercer Gold Mining
Co., Fairfield, Utah; Chample's Mines, Huachuca Dis-
trict, Yavapai County, Ariz.; The Crowned King and
Last Chance Mine, Yavapai Co., Ariz.; The Union Mines,
Maricopa Co., Ariz.; The Revenue Con. Gold Mining Co.,
Revenue via Norris, Mont.; The Oregional Mining &
Milling Co., Oregional, Cherokee Co., Georgia; and
others in course of operation.

The object of this company is to introduce the Mac
Arthur-Forrest process.
We have purchased from the Cassel Gold Extraction
Co., of Glasgow, Scotland, the exclusive right for the
United States to use patents covering this process.

If you desire an experimental test communicate with
the secretary.
If the results of the tests are favorable, we will then
make arrangements to treat a quantity of not less than
five tons at Denver.

We are fully prepared to grant royalties to mine and
mine owners, or rights covering districts and counties.
The process consists of pulverizing the ores to a fine-
ness of about 60 mesh, and then subjecting the same to
an action of a very diluted solution of cyanide. A few
tubs especially constructed according to our diagrams,
for triturating, settling and filtering, is all that is re-
quired extra in connection with any kind of pulverizing
stamps or rolls.

The total cost, as a rule, does not exceed from \$2.50
to \$5.00 per ton.

The most desirable class of ores for this process
the so-called refractory gold ores, pyrites, hematites
manganese and tellurium. We have also treated suc-
cessfully dry silver ores.

We will be pleased to answer any inquiries and fur-
nish any desired information. Address,
T. L. WISWALL,
P. O. Box 928. Gen. Mgr. and Secretary.

A. T. DEWEY } Dewey & Co.'s Scientific Press Patent Agency { ESTABLISHED
W. B. EWER }
Geo. H. STRONG. } 1860

INVENTORS on the Pacific Coast will find it greatly to their advantage to consult this old, experienced, first-class
Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal
nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original
cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies.
The information accumulated through long and careful practice before the Office, and the frequent examination of
patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us
often to give advice which will save inventors the expense of applying for Patents upon inventions which are not
new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, San Francisco.

Electricity.

The Electric Furnace.

It is not a little singular, says London *Industries*, that the first serious attempt to use the heat of the electric arc, though proposed for reducing purposes half a century ago, was in a purely industrial process, namely, that of Cowles for the production of aluminum-copper alloys, instead of for purposes of research such as readily suggest themselves. The oxygen furnace, as distinct from the oxy-hydrogen blow-pipe, has been in the hands of every technical chemist requiring high temperatures for some time, but the number of those using the more powerful arrangement, which owes its origin and efficiency to the ease with which electrical energy can be converted directly and automatically into heat, is not yet great. M. Moissao, whose name is well known on account of his investigations on fluorine—the isolation of which he is said to have effected, although that it is not yet placed beyond doubt—has lately turned his attention to the behavior of various refractory oxides when subjected to the intensely high temperature that can be obtained from the arc under proper conditions. The material of which the furnace was made was lime, as in the case of the arrangement ordinarily used for melting platinum by means of an oxy-hydrogen jet, but in this instance the single entrance hole was replaced by two, disposed opposite each other for the reception of the electrodes, as in the Cowles furnace. To the most powerful apparatus used a current of 450 amperes at a pressure of 70 volts was employed, and a temperature of about 3000 degrees C. was attained. It must be remembered, in comparing this temperature with those that are given in text books as the fusing points of refractory substances, that recent improvements in pyrometry have shown that all temperatures above 1000 degrees C. have been hitherto over-estimated, sometimes grossly, and that the highest temperature industrially reached is about 1500 degrees C., and even this is not common. The results obtained by means of this electric furnace are, as might be supposed, of the most remarkable character. At a temperature 2500 degrees C., lime, strontia and magnesia crystallize in a few minutes, and if that temperature be exceeded, the material of which the furnace body is made runs down like water. One would like some information as to the purity of the lime before accepting this statement unreservedly, as the presence of inconsiderable quantities of impurities, notably acid oxides, materially affects the refractoriness of lime and other basic materials. However this may be, it appears that the lime is reduced to calcium at this point, another instance being afforded of the enhanced reducing action of carbon at high temperatures which found application in the Cowles furnace, even against the teachings of thermo-chemistry, arguing from data true at more ordinary temperatures. Another phenomenon, equally characteristic of reactions taking place under such conditions, is the formation of a carbide of calcium, which is fusible at red heat. Magnesia affords no solution of the problem of producing a furnace capable of withstanding the action of a powerful arc, as its fusion can be accomplished in the same way as that of lime. Crystallized alumina has been familiarized to us by the researches of Fremy and Verneuil on the production of artificial rubies, and the announcement that at a temperature of 2250 degrees C. it fuses and crystallizes on cooling is less startling than the news of the comparative ease with which molten lime may be obtained. The addition of a small quantity of chromium oxide causes the formation of small rubies, but they are inferior to those that have been already produced by other methods. If any deduction can be drawn as to the method of their production in nature, it is rather that the mineralizing process has been less intensely plutonic than one was formerly inclined to believe. The most noteworthy fact in connection with the behavior of alumina in the electric furnace is that on continuing the treatment it can be completely volatilized. This is not altogether without parallel, as some time ago an account of experiments by Seger was published in these columns, which went to show that silica was similarly volatile at very high temperatures. Chromic oxide, manganese dioxide, ferric oxide, nickel oxide and cobalt oxide all underwent change, the higher oxides being reduced to the lower compounds and the resulting products crystallizing at temperatures below the maximum obtainable. Titanic acid could also be crystallized, fused and volatilized according to the temperature used. Zinc oxide volatilized freely, and was deposited in long, transparent needles.

Electricity in the Kitchen.

Electric cooking is now coming into a commercial stage, says the *Electrical Review*. We must, of course, in electric heating, allow for all the waste in converting the coal at the central station into heat and the heat into steam and the steam into current and the incidental heat losses of line transmission. But let us suppose we are waiting for a simple breakfast, and score down the items rolled up on our accounts current by Chloe, in the kitchen, while she is converting the raw material of the butcher and grocer into manufactured product that will meet the approbation of our palates.

First, let us suppose she is operating the coal range. Item—One bundle of kindling to start her fire, two cents; item, one-half of daily coal outgo (one ton per month), ten cents; total, twelve cents. Let us thrust out of view for the present why she uses so much coal, remembering only the cardinal and imperious fact that she gets away with one ton of coal in one month to operate her range, for which our good cash falls with a cold, dull plunk into the pockets of the coal barons. Now let us use electric utensils for the same work. We are having chops, soft-boiled eggs, griddle cakes and coffee—a simple, wholesome and frugal diet if Chloe can cut down the heat tariff. We will first heat two quarts of water, which will fix matters for the coffee and the eggs. Item, four amperes at 110 volts, ten minutes, 1½ cents; item, chops, seven amperes at 110 volts for ten minutes, two cents; item, 15 griddle cakes, five amperes at 110 volts for ten minutes, 1½ cents, making the aggregate cost for heat 4½ cents, at the end of which time off goes the current and the expense stops.

The figures here used are based on the use of the coffee-pot, boiler and griddle, electric utensils, and are substantially correct. Their import is simply this—that there are two sides which must be considered in the matter of electric heating. An oven will furnish for nine cents the heat necessary to send to the table a five-pound roast of beef in 35 minutes, or a twelve-pound turkey in 45 minutes—that is to say, the current is flowing for those periods. The actual baking or roasting goes on longer because, after the oven is heated to 300 degrees or more, as required, the current may be cut off and the process of cooking will continue until the roast is "done."

A Traveling Telephone.

The introduction of general telephones in large apartment houses and office buildings is not so rapid as it should be. This is possibly due to the fact that there has been no means for bringing the telephone to the occupants when the occupants would not go to the telephone.

Here is a bright idea in the use of telephones in high buildings: By the aid of the conveyor the instrument may be available for use on any floor of the building. The ordinary telephone set, comprising magneto bell, transmitter, receiver and battery, is mounted upon a conveyor carriage sliding between grooved sides of a light elevator structure extending vertically between the several floors where the service of the instrument is desired. The conveyor is connected by a rope passing over a pulley at the top of the elevator slides with a counterweight. The electrical connection of line and ground wires is made by spring brushes constituting the terminals of the instruments bearing upon metallic bands or strips attached to the front of the elevator frame, or, if preferred, may be effected by flexible conductors after the manner of annunciator wires to a passenger elevator.

Suitable openings are required in the floor next to the wall where the conveyor is erected to allow of the passage of the telephone set, and a tray may be attached under the battery box for carrying letters or small parcels. To facilitate movement of the conveyor a draw-cord is made to extend downward from it, terminating at the under side of the counterweight. The same principle is also applied to the horizontal movement of a telephone set in establishments spread out upon a single floor, the rails upon which the carriage moves being in this instance utilized as circuit connections.—*Electrical Review*.

Useful Information.

Labor in England.

Robert Giffen, the well-known statistician, was called upon to testify before the Royal Commission on Labor as the assistant secretary to the Board of Trade. His remarks are reported as follows to an English paper:

The great bulk of the working classes in general employment were shown by the statistics collected to receive an average wage of between 20 shillings and 30 shillings a week. A large number were paid over 30 shillings, and about 25 per cent under 20 shillings a week. Statistics of domestic service had not yet been touched in the tables, although such employment engaged from a third to a half of all women and girls earning their livelihood. The average remuneration of women in non-domestic service was £32 a year, while the remuneration in domestic employment was nearer £50. The average earnings of manual labor were: For men, about £60 per annum; for women, about £40; for lads and boys, £23.8, and for girls, £23. The aggregate earnings of manual labor were about £630,000,000, as compared with £640,000,000, the amount earned by the other classes of labor and coming within the income tax. Fifty years ago half our working population consisted of agricultural laborers, and their work was paid for at a low rate. At the present time less than one-fifth of the population are agricultural laborers. This substitution of better paid for worse paid employments, and possibly the depreciation of money since 1850, had improved the mass. The greater part of the rise in wages occurred before 1872. There had been a great fall since, probably of from 25 to 30 per cent, but as compared with 50 years ago wages were now much higher. He was of the opinion that the statistics as to strikes ought to mitigate the impression with respect to the seriousness of the mischief occasioned by strikes. The loss of wages occasioned by strikes did not amount to more than a fraction of one per cent of the total wage earnings of the community; he believed it was about one-fourth or one-fifth of one per cent. The average duration of strikes was about three weeks. When a strike lasted for a shorter period than three weeks it did not follow that, although the wages were suspended for that period, the workmen concerned would at the end of the year have received three weeks' wages less than they would otherwise have obtained, inasmuch as three weeks' idleness could in many trades be made up at other times. Under these circumstances the total loss of wages occasioned by strikes would be even smaller than he had stated. He thought, therefore, that the directly bad effects of strikes might have been somewhat exaggerated. He considered, however, that strikes had indirect effects which were very important, such, for instance, as the loss of some particular trade with which there was foreign competition. The total membership of trades unions was 871,000 out of a total adult population of 7,250,000, and the annual income was nearly £1,200,000, or about 27 shillings and 6 pence per head of the members.

How Some Fires Originate.

A list of unusual and curiously caused fires has been compiled and the *Railway Review* mentions some of the number. It includes a factory fire which was traced to a railway truck, an overheated axle having thrown a car from the track and set fire to a petroleum tank from which the flames spread to the building. An instance is given in which a bucket of greasy waste was ignited by the friction of a belt which sagged against it. In a harmless case of spontaneous ignition of oily waste, this material, with some wood chips, had been thrown into the fire-box of an idle locomotive, shortly after which the workmen were surprised by the blowing-off of steam by the engine. Another fire was due to oily waste in a manner which could not well be foreseen. Only heavy mineral oils were used, and a place was provided for the waste, but a cock-chaffer crawled from the receptacle directly to a gas jet, when the creature was quickly consumed, and the oily cotton filaments adhering to its body spread the fire. Well-known incendiaries are photographic and other lenses which act as burning glasses, and bright, tight plates, which serve as concave mirrors. A plumber's exploit consisted in applying the flame test to a newly-made joint in a gas pipe, then covering the pipe without noticing a small, blue flame, which was discovered some six weeks afterward, when the leak had become somewhat enlarged. A nail glanced from a carpenter's hammer into the conveyer of raw material

in a jute factory, rubbed against the drum and produced a spark which set fire to the place. A flood burned one factory by causing a pile of iron filings to oxidize so rapidly as to become intensely heated. A stream from the firemen's hose started a second fire in New York while putting out one in a small building, a neighboring shed containing quicklime having been penetrated by the water.

Pains in the Heart Region.

Pains in the region of the heart are common, and the general dread of this disease makes many people imagine that they have heart disease when there is any local affection in this region. Many who think they are suffering from heart disease have their pain caused by the pressure of the stomach when distended with food or gas. Neuralgia or muscular rheumatism of the chest-wall will give similar pains in the heart region, which may readily be thought to come from heart disease. The obscurity which involves the whole subject of the heart's nervous system makes it impossible to tell definitely about such pains. Various drugs, which will slow the action of the heart, will sometimes give relief. But it is necessary first to ascertain positively if the heart is really affected.

Those who suffer from such pains can frequently discover the cause better than the physician. There is no reason why such pains should give cause for alarm. Even though neuralgia or rheumatism is causing pain in that region, it is not essentially dangerous. The best plan at such times is to keep in a dry place, avoid draughts of wind, rain or wet weather, and remain in a lying posture for hours. This gives the heart rest and gradually strengthens it. Hot, dry applications over the region are always good. Those suffering from neuralgia and heart disease should always apply hot flannels over the region of the heart when the pain is severe. This will prevent the neuralgia from settling in this organ, the most dangerous spot.—*New York Ledger*.

Why Lost People Walk in Circles.

The fact that people lost on a desert or in a forest invariably walk in a circle is due to a slight inequality in the length of the legs. Careful measurements of a series of skeletons have shown that only 10 per cent had the lower limbs equal in length; 35 per cent had the right limb longer than the left, while in the other 65 per cent the left leg was the longer. The result of one limb being longer than the other will naturally be that a person will, unconsciously, take a longer step with the longer limb, and consequently will tend to the right or to the left, according as the left or right leg is the longer, unless the tendency to deviation is corrected by the eye.

The left leg being more frequently the longer, as evidenced by measurement of the skeleton, the inclination should take place more frequently to the right than to the left, and this conclusion is quite borne out by observations made on a number of persons when walking blindfolded. Further, on measurement of the arms, it is found that in 72 per cent the right arm is longer than the left, while in 24 per cent the left arm is the longer, showing that a considerable majority of persons are right-handed and left-handed. The inequality in the length of the limbs is not confined to any particular sex or race, but seems to be universal in all respects.—*Pearson's Weekly*.

DR. S. W. MITCHELL, with others, has been making experiments with the venom of different serpents. He has found that, aside from its poisonous qualities, it contains living germs which have the power of increasing enormously fast. So, you see, when an animal is bitten these tiny bits of life, entering with the poison, cause harmful action to begin almost at once. Dr. Mitchell has found that the nervous center controlling the act of striking seems to be in the spinal cord, for if he cut off a snake's head and then pinched its tail, the stump of its neck turned back and would have struck his hand had he been bold enough to hold it still.—*St. Nicholas*.

20-Stamp Mill for Sale.

In Southern California, a 20-stamp Gold Quartz Mill, with engine, boiler, self-feeders, rock-breaker, etc. At the premises are adjacent to Railroad, the Mill could be conveniently removed. Can be had at low price for cash. Address "Quartz Mill," care MINING AND SCIENTIFIC PRESS, San Francisco.

Sampling Works for Sale.

The works are situated at Daguerre, Cal., in the Calico Mining District, and on side track of the Atlantic & Pacific Railroad. They contain a first-class 50-horsepower Engine and 45-horsepower Boiler, with Ore-crusher and other machinery, Mill Scales, Assaying Outfit, etc., all nearly new. Also upon the premises an office building and a comfortable dwelling-house (portable). The above can be had at a bargain. Apply to JOHN H. GILBERT, 1914 Stockton St., San Francisco.

The Tale Told by the Teeth.

The development of the molar teeth of the human jaw is a history which is claimed to reveal some interesting points in the genealogy of man and the relationship of races. It is now some five years since Prof. Cope urged the opinion that the tubercular forms usual in the cusps of human molars point to a reversion to the type of dentition prevailing among the lemurs, and the inference was near at hand that in the discussion of the evolution of the genus *Homo* we had better look toward a lemurian rather than a simian progenitor.

His statements were studied closely by several German writers, and also by Dr. H. F. Osborn of Columbia College, who, in a recent number of the *Anatomischer Anzeiger* (No. 24, 1893), presents a summary of results, some of the weightiest taken from his own researches. He shows that the primitive form of the mammalian molar was a single cone, to which all the other cusps have been successively added. Four, five or six cusps, and various intermediate tubercles, appear on the molars of some of the primates. The tubercles of the human molar may be considered a reversion to the lemurine type, and Dr. Osborn maintains that, in comparison, the quadratubercular form was a comparatively recent acquisition compared to the tributercular.

The attempted application of these traits to racial anatomy cannot be said to have resulted in anything definite. It may vaguely be affirmed that in the molars of the lower jaw, which are the more distinctive of the two, four cusps are more frequent in the "higher" and five in the "lower" races. This is the opinion of Dr. Topinard in his latest writings on the subject. He seems to have little respect for the lemurian theory, referring to these as "animaux de transition discordante, a type non arrete."

Prof. Topinard has taken up the subject with his usual thoroughness in an article 70 pages in length in *L'Anthropologie*, December, 1892, entitled "De l'Evolution des Molaires et Premolaires chez les Primates et en particulier chez l'Homme." In this he withdraws somewhat from the position he took in his "L'Homme dans la Nature," and concedes that the molars must be traced back, step by step, to lemurian forms, but claims that the fundamental types of the molars are identical in man and the anthropoids; that these latter belong to the monkeys, while man as he is at present constitutes a sub-order in the general order of Primates.—Science.

BLOWING ENGINE FOR SALE.

Vertical pattern, with balanced steam slide valve gear, steam cylinder 14 in. diameter, air cylinder 40 in. diameter, stroke 24 in. 1 to 100 strokes per minute; engine new.

Patent Agency.

ESTABLISHED 1863.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 220 Market St., S. F.

Are You Going East?

Take the Santa Fe route. You will find it to your interest to call on or address the undersigned before purchasing tickets. No other line crossing the continent can offer you a trip combining equal comfort and pleasure. The only line running Pullman palace and tourist sleeping cars through to Chicago on the same train every day without change. Personally conducted excursions through to Boston leave every Tuesday. W. A. BISSELL, 450 Market Street, Chronicle Building, San Francisco.

GLADSTONE MINING COMPANY, C. J. Clark, M. E. Gen'l. Supt. FRENCH GULCH, Calaveras Co., Cal., Dec. 12, 1891.
 MESSRS. ADAMS & CARTER, San Francisco, Cal.—DEAR SIR: During my experience in mining and milling, I have used twenty-four of your four-foot Frue Vanners on different kinds of ore, both gold and silver. I have made competitive tests against them with other widely puffed-up concentrators and have always found the Frue in first place. When I built this mill (30 stamps), I determined to put in six-foot Frues in order to save space and machinery. I am now running four of your six-foot machines and they have been going for twelve months. They are taking the pulp from 20 stamps, crushing a minimum of fifty tons per day, and do better work than the four-foot tables. They require no more attention than a four-foot table and handle at least twice the quantity of ore. I have run them up to 80 tons per day and could not see that they were crowded. They stop and start as easily as the smaller tables and have the advantage of double capacity with the same bearings and wearing parts, requiring no more oil, and no more wear and tear than the smaller tables. My repair account for the past six months has been too small to mention. In order to give an idea of the work they are doing here I will state that the ore has varied monthly from \$5 to \$20 per ton and the tailings from nothing to 60 cts. per ton. I will conclude by saying that I cannot endorse the six foot Frue Vanner too highly, and it is the only table that I would have in my mill.
 C. J. CLARK, Gen'l Supt.

Saves all the Gold. Uses very little Water. Treats large quantities at Low Cost.

—BUILT SOLELY BY THE—

BUCYRUS STEAM SHOVEL AND DREDGE COMPANY,

BUCYRUS, OHIO, U. S. A.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

PIONEER DISTRICT.—Amador Record, March 16: Henry Tumalt shipped ten tons of ore to Sydney James' mill last week, which netted him \$900. He will now run double shifts and with the facilities at his command can easily take out ten tons a day. The ledge is 18 inches wide. He can have the ore hauled to James' mill for \$2 per ton. Milton Bearce struck a quartz ledge 12 inches wide last Tuesday. The ore is of about the same quality as that mined by H. Tumalt. The Irma Co. has cut the station at the 200 level and run a drift for 30 feet and exposed some very rich ore. While making the station, sinking was temporarily suspended, but will be resumed again next week. Wm. Floyd, of Nevada City, a miner of wide experience, has been employed as foreman of the Irma mine.

Calaveras.

THE HARRISON MINE.—Calaveras Chronicle, March 18: The developments being made at the Harrison mine on Esperanza creek, which was recently bonded by the Sandy Bar Co., are extremely flattering. In the tunnel run to tap the ledge at a distance of 60 feet, a four-foot ledge was struck, showing rock running from \$25 to \$100 per ton. The nearest found is fully as rich as that found at the time of discovery—a soft laminated quartz showing free gold in most every piece. A lower tunnel, run to tap the ledge 275 feet below present workings, is now being run, day and night shifts being employed. Machinery, cars, trackings, etc., passed through town this week en route to the mine. Mr. E. H. Davison of this place is superintendent.

AROUND MURPHY.—Calaveras Prospect, March 18: Collier and Canyon have completed their first 50-foot contract upon the O. K. mine, and will continue on to the completion of 100. The Norfolk mine is still in operation, and, though some difficulty is experienced in the excessive quantity of water, everything is proceeding diligently. It is reported currently that Haggin & Co. of Sheep Ranch have purchased the water ditch and works of Ide & Co. of Sheep Ranch. How true the report is has not been learned. Daniel Thompson was in town again on Monday, and is in high spirits over the quartz discovery upon his ranch, two miles north of town. The ore, from his description, is showing free gold and also contains a large percentage of silver. Wm. Dodson, an old-time prospector in this section, has one of the finest prospects in this section of the country. The rock is all of high grade and pronounced richness, and the proper delineations of a regular milling lode are unmistakable. The mine is situated about three miles west from town.

INDIAN CREEK.—It has been whispered for some time past that the famous mine on Indian creek, owned by Martin Bozovich and Joe Tentamastine, was under negotiation for bond or sale. The person whose attention has been drawn to the mine, it is said, is no other than W. H. Cleary of Sheep Ranch, agent and superintendent for the famous J. B. Haggin mine of that place. The matter has been kept rather secret, but it is now becoming noised about, and a general interest is being aroused. This mine has been noted in the past for its great richness. One of the owners paid a visit to Europe, and it is stated upon eminent authority that both men have become rich. They have quietly worked their mine for years past, and no one except a visitor there or an intimate acquaintance ever knew much of the mine's true worth. It seems, however, that the gentleman above referred to has been wide awake in noting the valuable mines in Calaveras, and his personal inspection of nearly all of them has been made quietly and unobtrusively. If the sale of the Bozovich mine takes place, every one can congratulate himself that the mine will have gone into able hands, not only from a scientific and practicable view, but from a monetary standpoint. The Bozovich mine is situated about two miles above the Esmeralda, on Indian creek.

Nevada.

SUSPENDED OPERATIONS.—Grass Valley Union, March 16: The Sanvee mine, better known as the Golden Treasure, and situated beyond the Empire mine, has suspended operation for a period of two months. A surplus of water is the cause of the mine being closed down. It will be started again in the spring, however.

PROSPECTING.—The main shaft of the St. John mine is down to a depth of 300 feet, and it is the intention of the company to sink 200 feet deeper, in order to thoroughly prospect the ground.

ANNUAL MEETING.—Grass Valley Telegraph, March 17: The annual meeting of the Seventy Mining Co. was held in San Francisco Wednesday and the following officers were elected to serve for the ensuing year: A. P. Bacon, president; Peter Amiranz, vice-president; J. Bertz, F. E. Berge, A. C. Ellis and Geo. L. Payne, directors. J. J. Scoville was re-appointed secretary, and G. A. Taylor, superintendent. The reports of the financial condition of the company show clear sailing for many months ahead. The work of development is being vigorously prosecuted at the mine, which is considered a very valuable property.

TO WORK TAILINGS.—A San Francisco company has a new and simple process of working tailings from quartz mills, and its scheme is to put in its plant on Deer creek, near Waite's ranch, Nevada county, and work over the tailings from the Providence, Champion and Mountaineer mines. It will pay the mine-

owners a stated price per stamp for the exclusive right to work the tailings from their mills, and have fair prospects of making something out of them. The Chinese have heretofore had a monopoly of such mining here, and they make it pay, even by the laborious process of cradle and rocker.

KENTUCK MINE.—Grass Valley Telegraph, March 16: The prospects out at the Kentucky mine are now very flattering. There is a large ledge down at the depth of 100 feet and it is looking exceptionally fine. The owners are very much encouraged over their present prospects. Dan Deeble and company are now working on the mine and have the highest opinion of the property, and they are excellent miners. The mine is owned principally by Capt. John Carter, foreman of the Idaho, and by John M. Thomas, of the Citizens' bank. The Kentucky is within a "stone's throw" of the great Idaho mine, and is just a little east of north from that famous property.

KING SOLOMON MINE.—Union, March 18: Work on the King Solomon mine is steadily progressing under the able supervision of Supt. Brockington, who informed a reporter yesterday that in about a month the company expected to have its fine new mill in operation. There is at the present time some 30 or 40 tons of rock in the mill, and by the time the mill is started there will be at least a hundred tons of quartz on hand. Work on the ditches will be commenced as soon as the weather permits and the water-pipe will also be rapidly laid. The mill will be run by a Pelton wheel and will use about 25 inches of water.

Mono.

RICH STRIKE AT BENTON.—Bridgeport Chronicle, March 18: A Benton correspondent sends us the following in regard to a recent rich strike at Benton, in the southern part of Mono county: "Owing to the low price of silver many of the owners of low-grade mines have turned their attention to prospecting for gold. One of these prospectors, James Otis Wheeler, has found one of the richest gold-bearing ledges that has ever been discovered in this section of the country. The big discovery is situated about nine miles in a south-westerly direction from the small and lively town of Benton, Mono county, California. James Otis Wheeler, the lucky discoverer of this bonanza, is an old-timer, having come to California in the early days of gold. He is therefore well versed in all the forms of gold mining and says he has never seen a better prospect. Notwithstanding the drawback of a few feet of snow which fell the week after he made his find, he is vigorously prosecuting the work of opening up the mine. He will erect a mill and proceed to work the ore as soon as the water permits, and at present secures enough gold to defray all expenses by the use of mortar and born. Enterprising prospectors are already staking out claims adjoining, notwithstanding the inclemency of the weather, and it is confidently expected that by the opening of spring one of the biggest rushes ever seen will take its way to the new discovery. The ore is what is called wire gold, and is so rich that a piece cracked with the hammer will be held together by the gold. The first assay went \$9000 a ton, and it is expected that better will be found."

San Bernardino.

VANDERBILT DISTRICT.—Cor. White Pine News, March 18: There are two great mineral districts adjoining, namely, New York and Vanderbilt in San Bernardino county, Cal. The first-named formation is lime and porphyry. A Denver company is now operating there with a force of 80 men bolder forth in dugouts and tents. The ore runs about 35 ounces in silver and from 30 to 40 per cent lead. It was originally claimed to be a gold camp, but after its purchase found to be the contrary. They are busy making roads and developing a group of eight mines and storing ore until the advent of the railroad now in course of construction.

The Vanderbilt formation is gneiss or quartz, and its appearance is certainly indicative of a good, strong mineral belt, and is situated about 35 miles from Gaff's station on the line of the Atlantic & Pacific, and seven miles westerly from New York, and bids fair to be an extensive camp. Two of the principal mines are down about 75 feet, with drifts run for 60 feet, showing veins quite continuous but narrow and best quality of ore shipped has averaged about \$60 gold and \$35 silver—reckoned as a gold camp—all the prospects showing two-thirds gold. The ore is of a sulphuretted character and water is coming in at aforesaid depth. Springs are close by and a number of millsites are located there.

Lyle has bonded the Gold Bronze for \$40,000 and the Gold Bar is bonded for \$75,000, and it is now a foregone conclusion that said sales will be consummated as they have taken up two millsites for the purpose of reducing ore within a mile from the mines.

The camp is located in a narrow wash, with about a dozen tents, consisting of one lodging house, three boarding houses, two saloons, one general merchandise store and Chinese laundry. Only 18 men are employed regularly, but upwards of 200 men are in the district prospecting, and for a 90-day camp it is quite lively.

Shasta.

FROM LOWER SPAINOS MINES.—Cor. Shasta Courier, March 16: For the last few years the miners of this district have been pleading for some process by which our rebellious ores can be worked for a nominal price. Very little ore in this vicinity is called free-milling. A large portion of our rebellious ores will not work in a free mill more than 20 or 25 per cent of the assay value. There is strong evidence of a plant being placed somewhere on the Sacramento river this summer. I hope some of our mining capitalists will see and act upon such an important enterprise. I am confident the ore could be worked at Middle Creek station

for the price now being paid for shipping to the Selby Works. To build such a plant at Middle Creek station would be a prudent move and a Godsend to this vicinity. There is a vast area of mineral deposits lying west of the Sacramento river. One great drawback in this vicinity is that our home capital too frequently engage in kicking the nose off their own faces. We certainly have a variety of kickers. Some kick because they do not possess the whole district. Some have a dozen or more locations and kick because they haven't more. Others kick for not having a mine in close to a bar-room stove. Some have good prospect, others have none, and that is the way the world first begun. We are all living under one canopy of heaven, and why not unite ourselves and use our utmost endeavors to build up our mining industry and be hopeful, and use our personal efforts in the advancement of our mines and homes. Our faithful ideas will convey to others the importance of such work. All that is lacking now is money. To overcome this detriment we must induce capital and a change of workmen to step in here and take the places of so many old stiffs, as they are familiarly called. This will improve the present condition of affairs.

Trinity.

GRAVEL.—Cor. Trinity Journal, March 16: Mr. Keach has on his place about 75 acres of gravel, which is said to be very rich wherever prospected. His ditch is about a mile long and the water is brought to where he is mining with a pressure of only 30 feet. The banks are about 25 feet high and the bedrock flume is 11 boxes long and 30 inches wide with a splendid dump of over 100 feet of perpendicular fall into the river. There is a streak of blue gravel in the bank, which, we are informed, is very rich, as much as 75 cents per pan having been taken out. Owing to the fact that the water supply is very limited but a small piece of bedrock can be stripped during the season's run. Three or four 15-minute runs per day can be had, but for the amount of work done it is said to pay well. About a mile below, on the same side of the river, a couple of Swedes are engaged in mining in a small way, and are believed to be doing well.

GLOBE MINE.—Cor. Journal: Perhaps you or the readers of the Journal would like to know something of the snowy regions. The snow here is 15 feet deep at present and still falling at the rate of one inch an hour. The boarding-house at the mine was visited last night with a snow-slide, but no damage was done except a big scare for the boys. It rambled over the house like an omnibus on the streets of New York. On the divide crossing over to the Globe mine the snow has drifted to the height of 75 feet.

Tuolumne.

BLACK OAK.—Tuolumne Independent, Mar. 16: A steel cable, 700 feet in length, is on the road for the Black Oak mine. When it arrives they will commence sinking deeper. There is a splendid vein in the bottom of the shaft. The very rich vein recently discovered in shaft No. 44 will also be developed. The ten-stamp mill will soon be pounding away on rich ore. The mine gives promise of yielding large returns, better than ever in its history.

DISCOVERY.—Calaveras Prospect, Mar. 16: Jno. S. Sublet, from Stanislaus district, was in town again Sunday. He had with him specimens of ore from an entirely new discovery, and it is now apparent that that region is fast becoming worthy of distinction for its good bearing ledges. Good reports come in regularly from there and the attention of capitalists has been enlisted, and they are having much prospecting done that promises to aid materially the development of the district. The mines above mentioned are in Tuolumne county and east of the group of Collier mines, situated in Calaveras county.

NEVADA.

Washoe District.

CON. CAL. & VA. MINE.—Virginia Chronicle, Mar. 18: 1500 level—Have continued to extract ore and old fillings in working upward in the old south stopes, from the 10th to the 14th floors above the sill floor of this level. 1600 level—Are repairing the main south drift and the east crosscut leading therefrom to the upraise connection with the north drift on the 1500 level. Also extracting a few tons of ore from the old stopes east of the main south drift. 1650 level—Have continued making necessary repairs to the drifts on the sill floor of this level. We continue to extract some ore from the old stopes, eight floors up in the upraise No. 6 carried up from the main northwest drift; also from the old stopes in working north from the crosscut run west from the northwest drift. The north drift started 150 feet in from the northwest drift has been advanced 6 feet; total length, 51 feet; in a porphyry and quartz formation of a very low assay value. The south drift from a point 52 feet down in the winze started in the west crosscut has been advanced 12 feet; total length, 40 feet; continuing in a porphyry and quartz formation of very low assay value. From this winze, at a point 12 feet below the sill floor of this level, we are working in the old stope timbers and extracting some ore therefrom. Have extracted during the week from the 1500 level stopes and 1650 northwest drift openings and raised to the surface 565 cars of ore, about 5500 tons. Shipped to Morgan mill 747 50-2000 tons of ore. Average assay value, per railroad car samples, \$30.78. The average assay value, per battery samples, of all the ore worked at that mill during the week (545 tons) was \$27.62 per ton.

OPHIR.—500 level—Jointly with Mexican Co. continue doing necessary repair work in the west drift from the main shaft. 1565 level—Have put in a chute to hold the rock taken from the winze being sunk below this level. The winze has been sunk four feet in a por-

phyry and quartz formation, showing an average assay value of \$20 per ton.

MEXICAN.—On the 1565 level—West crosscut No. 2 from the north drift from the east crosscut from the bottom of the winze has been extended 18 feet; total length, 49 feet, continuing in a softer porphyry formation showing clay slips. Jointly with the Ophir Co. on the 500 level from the Ophir shaft continue doing some necessary repair work in the west drift from the main shaft.

UTAH.—340 level—The south drift from the main west drift at a point 595 feet in from the shaft has been extended 18 feet; total length, 183 feet; continuing in porphyry, clay and quartz formation.

SIERRA NEVADA.—The intermediate tunnel on Cedar Hill has been advanced during the week 18 feet, making the total length 218 feet; the face is in porphyry. Union shaft—The joint Sierra Nevada and Union west drift, 900 level, has been advanced 23 feet, making the total distance west of the joint shaft 3023 feet; the face is in clay and porphyry.

ANDES.—North drift from east crosscut No. 1 north on 420 level advanced 14 feet; total length, 160 feet; formation quartz.

GOULD & CURRY.—200 level—West crosscut No. 5 started in northwest drift, 432 feet from main west drift, has been advanced 17 feet, passing through hard porphyry; total length, 383 feet. Suro tunnel level—The joint east crosscut with Best & Belcher Company has been extended 22 feet through quartz and porphyry; total length, 83 feet.

BEST & BELCHER.—200 level—West crosscut No. 1, started in northwest drift, 170 feet from our south line, has been extended 16 feet; total length, 130 feet; face in quartz. 900 level—At a point in west crosscut No. 3, 20 feet from top of upraise No. 1, 1000 level, started a south-west drift and extended same 20 feet, passing through porphyry. Suro tunnel level—The joint east crosscut with Gould & Curry Company has been advanced 22 feet during the week, passing through quartz and porphyry; total length, 88 feet.

HALL & NOACROSS.—We are repairing the south compartment of the main shaft below the 1200 level. Main Incline—We continue making the necessary repairs. 1400 level—Have finished retimbering the main north drift on this level and are now making some repairs to the station. 1800 level—West crosscut No. 1 from the main south drift was advanced 10 feet; total length, 193 feet. The face of this crosscut has reached the west wall and stopped. During the week have started a new west crosscut on our south boundary and advanced the same 10 feet; face in porphyry. West crosscut No. 4 from main north drift was advanced 10 feet; total length, 240 feet. Have discontinued work in the face of this crosscut. In this crosscut, at a point 115 feet from main north drift, are cutting out and preparing to start an upraise on some promising streaks of quartz. The north prospecting drift from end of west crosscut No. 3 was advanced 17 feet; total length, 42 feet; face in quartz and porphyry.

CRUMLA.—The north drift from the south line, 550 level, is out 264 feet; face is in quartz that gives low assays. Are still retimbering the two north compartments of the main shaft above 930 level. The east crosscut near the south line, 930 level, is out 25 feet; face is in porphyry and streaks of quartz.

POTOSI.—Have completed repairs to east crosscut No. 3, 350 feet south of north line, 850 level, and commenced work in the face, which is now out 285 feet; face is in porphyry. The east crosscut opposite Potosi winze, 930 level, is out 315 feet; face is in porphyry. The north drift from east crosscut, 930 level, is out 40 feet; face is in porphyry and streaks of low-grade quartz. The north drift from top of raise, 1000 level, is out 205 feet; face is in porphyry and low-grade quartz. The south drift from top of raise, 1000 level, is out 248 feet. From the face of this drift are running a crosscut east, which is now out 28 feet; formation porphyry. No work has been done on the 1800 level during the past week on account of retimbering the Ward shaft. Extracted and sent to the mill the past week 448 tons of ore from the 550, 930 and 1150 levels. Milled during the week 500 tons; on hand at mill, 82 tons and 500 pounds. Average battery assays, \$21.60. Average car sample assays, \$25.04.

KANTOOK.—From the stopes above the 160 level we continue to extract from two to three tons of ore per day of the average value of \$30 per ton as per car samples. The south drift from the Jacket east crosscut on 1100 level is in 165 feet and continues in ore of fair quality.

NEW YORK.—The winze below the 650 level is down on the slope 105 feet; the bottom is in quartz showing occasional bunches of good ore. The west crosscut from the southwest drift, 850 level, is out 105 feet; face is in low-grade quartz and porphyry.

SILVER HILL.—The southeast drift, 450 level, has been advanced 5 feet, through hard porphyry; total distance from north line, 72 feet.

BULLION.—No work has been done on the 1800 level during the week, on account of timbering the Ward shaft.

ALPHA.—No work has been done on the 1800 level during the week, on account of timbering the Ward shaft.

EXCHASQUER.—No work has been done on the 1800 level during the week, on account of timbering the Ward shaft.

WARN SHAFT.—No work has been done on the 1800 level during the past week, as we are yet engaged in retimbering the shaft.

OCCIDENTAL.—Have started a crosscut from the main north drift on 750 level at a point 675 feet north of No. 1 winze. The face shows streaks of good ore. The winze from south

drift, 750 level, is down 111 feet; bottom in low-grade quartz. The Zedig drift, Suto tunnel level, has been extended 12 feet; total length, 870 feet from main tunnel; the face continues in hard porphyry.

Yellow Pine District.

THE CLAIMS.—Cor. White Pine News, Mar. 18: Now from Vanderbilt district cross the deserts and dry lakes, distant 45 miles to Goode Springs, thence by trail to Keystone in the center of Yellow Pine district, six miles; total distance from Goff on A. & P. road, 96 miles by said route, though by regular wagon road it is 110 miles, through deep, gravelly, sandy washes, and is equal to 250 miles of your northern routes for traveling. Yellow Pine boundaries are nearly 100 miles, and, from my limited travels and observations, is the most extensive and richest mineral belt unexplored and undeveloped within the confines of the Union. Its aspect is certainly very discouraging especially to a tenderfoot, and quite apt to drive him away into some more desirable clime. The formation is lime of varied character and porphyry; veins are quite irregular and country badly broken up in all directions by the volcanic disturbances of a million years or more ago. The Keystone mine is about the only mine developed to any extent, being 150 feet deep at present, with three tunnels in said distance, and has paid from grass roots, as from Aug. 1, 1892, to Jan. 1, 1893, it has yielded \$35,000, after a deduction of \$52 per ton freight, and if under wide-awake business management, would do still better. Another promising mine is the Golden Chariot, which is now shipping ore averaging 40 ounces, only 20 feet deep, with a 60-foot tunnel. Thence comes your scribe with a pet girl entitled the "Marceon Clemantina," have sunk an 11-foot shaft thereon; have extracted about six tons therefrom, with assays of 26 ounces gold per ton; width of vein in bottom about two feet, and four feet in length; walls are both lime, but expect that by sinking 30 feet I may strike contact; I own five-eighths and have bond on balance, so I intend to rustle a sale if possible to Denver people who have made a \$20,000 offer, but consider it too low from the showing of vein for 200 feet on surface and the outcrop generally of stringers observable in all directions, which, by judicious work, may show up much better than expected, as experts who have examined it claim it may exceed the Keystone, and is now reckoned second best with such little work done. The gold belt is ten miles square, ledges all running north and south, the gangue of the ore being a red oxide of iron, quite favorable for smelters for the flux therein. Outside of said belt are apparently inexhaustible mountains of heavy lead, carbon sulphate and carbonates, ranging from 20 to 80 per cent and running from 3 to 60 ounces in silver, clear beyond the Nevada State line. The Kansas City and Pueblo smelting companies have men early in the field, looking up and reporting on the claims. The field is not half prospected, though generally supposed to be all located. Only a few white men have been here, most of them our yep friends from Zion. The Nevada Southern Railway Co., incorporated in Denver, is now building into New York district, has 14 miles of rails laid and 30 miles graded, and calculate to reach Goode Springs by June 1st next. They have ordered another survey of 90 miles beyond and will push the work ahead. Look out for an immense boom as soon as the iron horse reaches this district, and knowing capitalists are sending men in here to explore the field in all directions, and as silver declines the gold fields must be invaded. Mesquite Springs is only ten miles from here, and an abundance of water can be had by sinking 3 to 12 feet deep. The population of this camp at present is 77,000. Water costs four cents a gallon. This is a hard country to get in or out of. Of horses there are none; even the patient burro is scarce, the few here being utilized in hauling water.

Tuscarora District.

NAVAJO.—Times-Review, March 16: The slopes above the 350-foot level are looking about the same and the slope above the 150-foot level is yielding a little very good ore.

BELLE ISLE.—Line crosscut, 250-foot level, extended 5 feet. North drift from same extended 6 feet. The slopes are looking and yielding about the usual quantity of ore.

NORTH BELLE ISLE.—North drift, south 300-foot level, extended 6 feet; no change. The slope above this level continues about the same.

Aurora District.

TO RESUME.—Walker Lake Bulletin, March 15: Private letters from John Niede of Aurora to a citizen of Hawthorne convey the cheerful news that \$300,000 have been raised in London for the purpose of resuming work in the Con. Emerald mines of Aurora. We are informed that it is the purpose of the company to run a tunnel from the lime kiln, a distance of a mile and a half, and thereby drain the mines several hundred feet below their present deepest works. That this work will prove the existence of large and paying ore bodies is almost certain. Mr. Ann, the director of the company, will arrive about May 1st, and he will personally superintend the work. In case the developments should warrant it, a mill will be erected on the ground to be run by electricity transmitted from the Walker river, a survey for which has already been made. Speed the good work!

ARIZONA.

NOTES.—Mohave Miner, March 16: The miners are all making money on mines in Indian Secret district. The reported gold strike north of White Hills are turning out first rate as work on the properties progresses. There are 20 tons of concentrate from the C. O. D. mill at the Kingman depot, and Charles Lynch informs us there are 60 tons more at the mine awaiting transportation. P. R. Washington has struck

a big streak of 500-ounce silver ore on the Big Dick mine, near Eugene Camp, owned by himself and D. R. Beebe. The owners feel pretty good over the find. Ed. Phenix and Geo. Blaine have in several tons of rich ore from their lease just finished on the Prince Albert mine, Indian Secret district. They have now three men at work on the Miner's Dream and will make a big shipment from this property next month. The rich gold mines of Gold and Lost Basins are now coming to the front. Mining men are going there daily to look over its vast possibilities and invest their coin freely in its mines. With the better and cheaper facilities for the working of ores every mine in the two districts will be worked on a large scale. In the south drift of the Blake mine, south of town, a splendid showing in free-gold ore is being made. The ledge is increasing in width as drifting progresses. Judge L. O. Cowan and Sergeant J. L. Sullivan have gone to Needles and thence will proceed along the river range of mountains on a prospecting trip. The Gold Basin mill is running steadily on El Dorado ore and seems to be working it successfully. Supt. McLeish has about a dozen men at work on the mine and is opening it up in good shape and at the same time taking out enough ore to keep the mill pounding away steadily. The Happy Boy mine, situated at Eugene Camp, has been sold to J. W. Gross, of Chicago, for the sum of \$10,000. This property was owned by Tom Chidester, Ide Hamblin, Ed. Williams and Charles Merritt, and although very little development work has been done as yet, it is a fine looking prospect and is likely to prove a bonanza to its present owners. W. B. Thompson, of this place, has been instrumental in the consummation of the sale of the mine Baron de Lsgrang, of Denver, Colo., who has been examining the mines of White Hills, Gold and Lost Basins, went west on Tuesday night's train. In conversation with a Miner reporter he said that in no portion of the west (over which he had traveled extensively) has he seen such vast fields of minerals as in the county of Mohave. Chain on chain of mountains bearing precious metals paralleled each other over the entire breadth of the country and extending north and south within its border for 300 miles in length. The ores of gold, silver, copper and lead were far richer than in any other part of the great west and the time was now ripe for the influx of capital from the States and Territories where the mineral resources were fast becoming exhausted. The Baron will return shortly to old Mohave and will be the means of investing large sums of money in our mines.

ALASKA.

NOTES.—Alaska Journal, March 10: William T. Turner, who for the past seven years has held the responsible position as foreman of the mill at Treadwell's, will leave on this boat for an extended visit to his home at Sutter Creek, Cal. For some months past Mr. Turner has been unwell and goes below to recruit his health. It is the sincere wish of his host of friends here that he will soon return to us with renewed strength and vigor. Mr. Turner has been engaged in mining and milling ever since he was a lad of 17 years, and is considered authority on all matters pertaining to his business. The system now in operation at the Island is a striking example of his skill. We can ill afford to spare such men. Alaska needs them. Fred. D. Nowell, manager for the Newell Gold Mining Co., who has been spending the winter in San Francisco, will return to Alaska on the first steamer in April. The company is having a fine steam launch built by Earle & Engelbrecht, Lake Washington, which will ply the waters between here and Berner's bay. Wm. Brierly, who has been watchman for the Silver Queen Mining Co.'s properties in Sheep Creek Basin, will start for the Yukon on Monday. Mr. Brierly is an old "Yukoner," having been in twice before and is well posted regarding the country. A. Frank and E. Shumacher started for Sumdum last week to develop the property they own there with Messrs. Reid & Robbins. It is one of the best prospects in Alaska. Henry Mead will shortly leave for Berner's bay with several men to put up the Berner Mining Co.'s new mill.

BRITISH COLUMBIA.

MINING NEAR YALE.—Inland Sentinel, March 18: Mr. Geo. D. Rodney, of Yale, reports that he has just returned from Tacoma, where he sold a five-sixth interest in his claim on Siwash Creek, the Bonanza, to Messrs. John A. Parker, Geo. A. Libbey, Chris. Bertlesen, Bertel Bertlesen and Philip L. Reese. Mr. Rodney is one of the oldest miners in the Yale district, having had his present claim for 14 years. As soon as the snow disappears, work will be started up on his claim and will be carried on all the summer. While on his way back from Tacoma, Mr. Rodney stopped off at Whatcom, and saw some men there who own a claim next his, and was informed they intended to work the claim this year. Mr. C. T. Dunbar, of Vancouver, also has a claim near there, and he has been working most of the winter night and day with a big gang. The cold weather, however, considerably interfered with work, as the thermometer went down as low as 30 and clove on to 40 degrees below zero.

IDAHO.

GEM MINING.—De Lamar Nugget, March 18: The town of Opaline now has stage lines running into it from both Caldwell and Nampa. Mining for gems is being profitably pursued and the extent of the field in which they exist appears to be larger than it was at first supposed to be. The scarcity of water is one of the drawbacks to the camp which the claim owners will try to remedy by boring for artesian water. It is quite probable that water will be readily found, as the existence of mud springs in the vicinity and of warm springs lower down, indicate that there is a flow of water not far below

the surface. Many of the gems found are unquestionably fine and valuable. The industry of mining for them will, without doubt, become one of the important industries of the country.

THE ONLY PRODUCER.—Ketchum Keystone, March 18: The Last Chance is the only producing mine now being operated in the Atlanta and Rocky Ber regions. It is distinctly a gold mining proposition, carrying a very little silver, and is probably now the most valuable going gold venture in Central Idaho, if not in the whole State, and our enterprising townsman, Major Hyndman, is to be congratulated over his most promising gold prospects, notwithstanding the knock-out disaster to his Silver King efforts for the time being.

MONTANA.

SMELTER TO CLOSE.—Butte Inter-Mountain, March 18: In less than two months from date, the fires will be drawn at the lower works of the Boston & Montana Company in Meaderville, and, while that locality will still produce its quota of rich ore from the mines of the company, none of it will be treated here. The upper works long since abandoned its furnaces, and, as soon as the quantity of ore on hand is treated, the lower works will also close. The closing of this smelter will affect about 200 workmen, but it is more than likely that the most of the employees will be given work at the Great Falls smelter. The lower works are in excellent condition, and there is considerable speculation as to what the company will do with the valuable buildings and machinery. The hoists and small concentrating plant, formerly in use at the upper works, are now being removed to Great Falls, and it is probable that the machinery from the lower works will also be removed to the Cascade City. Owing to the decision of the company to suspend work at the lower works, work has also been suspended at the Moose, where about 30 men were employed during the past month. The ore produced from this property has been treated at the lower works, but it is not considered to be sufficiently high grade to warrant the expense of mining and shipping to Great Falls. While the same number of men is employed at the Leonard shaft, there were a few miners dropped at both the West Colusa and Harris & Lloyd during the past week. It is believed, however, that the lay-off was merely temporary, and that when everything is in shape at Great Falls, the largest force of men ever employed by this company will be occupied in digging from the earth its rich product. During the week mechanics have been engaged in laying the foundation for the large pump which will be placed at the 600-foot level of the Leonard shaft. This pump is a new departure in this class of machinery for underground work, and consists of an ordinary Corliss engine, with the piston attached to the plunger of the pump. It was built at Chicago under a German patent. The pumping machinery is built entirely of brass to withstand the effects of the acidulous water, which plays havoc with ordinary iron. The pump is a compound, condensing one, and is guaranteed to raise 900 gallons of water per minute 600 feet in height. Only about one-half this amount of water is now being pumped from the West Colusa, which drains the Leonard, so that the pump need not be forced to keep the mine of the company freed of water. The new smelter of the Montana Ore Producing Company, of which F. A. Heinze is the general manager, is working about 200 tons of crude ore per day. During the past week the new water-jacket blast furnace was started up, and, it is understood, gives good satisfaction. Most of the matte obtained from the furnaces will average 75 per cent pure copper. This matte is crushed and sacked at the smelter and shipped to New York. A great many improvements will be added to this smelter during the present year. The dangers from fire will be reduced to a minimum by the substitution of slag walls for the ordinary timber, and the insurance rates have already been reduced through an improvement by which water can be applied to any portion of the building in the least possible space of time. The ore from the smelter is obtained from the Gleggarry or Osmbers, the Gambetta, Speculator and Pacific, each of which carries a high percentage of copper and silver. Mr. Heinze also, during the past week, leased and bonded the Cora mine. The Cora is on the same vein as the Lexington, and was known at one time as one of the greatest producers of the district. At present the workmen employed by Mr. Heinze are engaged in pumping out the water, and, as soon as this work is completed, Mr. Heinze will actively push the work of development and demonstrate the value of the property. Many of the old miners of Butte believe that development work is all that is needed to prove the Cora equally as rich as its neighbor, the Lexington. The bond is said to be for the sum of \$200,000.

THE ALICE REPORT.—The annual report of the Alice Gold and Silver Mining Co. for the year ending December 31, 1892, was issued Wednesday in pamphlet form. President Walker states that the period covered by the report has been one of curtailment, as far as it was in the power of the company to do. It was not practicable to close down the mine and works, but the operations had been limited. The great discount on fine silver, which was the heaviest known in modern times, had caused the company to run behind to the extent of \$18,025.62. The average discount on the sales of silver in 1892 was 36.06 per cent from the old standard of \$1.2929 per fine ounce. The average product of ores has also fallen short in the gold and silver value of the same for the previous year. On account of curtailing at the mill, the bullion yield was only \$577,480.67, reckoned on the standard value of \$1.2929 per fine ounce. The discount on the silver was \$193,950.26, so that the total product in gold dollars was but \$378,530.41. The president says that, with silver at the present price, it is impossible for the

company to make money, and the results for the ensuing year will be limited by the price of silver on the market and the grade of ore obtained. During the year the company's mills produced 614 bars of Dore bullion, containing in gold, at \$20.67 per fine ounce, \$25,159.52, and in silver, at \$1.2929 per fine ounce, \$577,480.67. The mill is reported to be in excellent condition, and some development work has been done in the mines aggregating 3029 feet. In the Alice, new ground has been opened and the slopes there are the largest producers of sulphuretted ores in the mine. Supt. Hall says that much as he would like to see more development work done, he cannot urge it on account of the depression in silver. The loss in quicksilver was 11,165 pounds. The total number of hands employed at the mill and mines is 204.

THE GAMBETTA.—Messrs. Mullins, Doyle & Co. have a lease on the Gambetta and have worked this property continuously since last December. The lessees put up a bond of \$7500 for the faithful performance of their part of the contract in developing the mine. Shipments are being regularly made to Heinze's smelter. The ore averages 18 per cent copper and 15 ounces in silver to the ton.

THE SPECULATOR.—The Speculator, which was the subject of a great lawsuit over a year ago, is now under lease to Case & Co. This mine, if properly developed, is said to be one of the richest of the district. The lessees are extracting a large quantity of 23 per cent copper, which they ship to Heinze's smelter. At the Butte & Boston smelter there are eight O'Hara's, four matte and one blast furnace in operation, and the daily output exceeds 40 tons.

JEFFERSON COUNTY ORE.—Some very rich specimens of copper ore carrying gold and silver were received in Butte this week from Jefferson county. The property is situated about seven miles north of Three Forks, and as yet but little development has been done. The Electric lode has a shaft down 30 feet deep and the vein is about seven feet in width, well defined from the surface. The lode has only a six-foot shaft, but both veins carry fine oxide of copper and gold in paying quantities. Thorn & Co. own these prospects, which are being developed as fast as possible.

OREGON.

THE VIRTUE MINING CO.—Bedrock Democrat, March 12: Mr. Geo. W. Borman returned yesterday from Portland and shortly after his arrival proceeded forthwith to the Virtue mine. At a meeting of the stockholders of the Virtue Mining Co., held in Portland a few days ago, Mr. Borman was elected to the position of manager and superintendent of the company. At the meeting of stockholders held while he was in Portland the affairs of the company were so arranged as to place future operations on a sound footing, and there was every assurance that the operation of the Virtue would be a success. The stockholders are greatly encouraged with the bright prospects ahead, and have placed sufficient money in the treasury to meet all requirements. Mr. Borman brings home with him the amount necessary to cancel the payroll. Mr. David Ogilvy, president of the company, and Mr. N. S. Wight will arrive from Portland to-day. The \$4000 gold brick taken to Portland a few days ago and exposed to the optics of the webfooters created quite a stir in mining circles, and great interest was expressed in the mines of Beker county.

UTAH.

THE MAMMOTH MEETING.—Salt Lake Mining Exchange, Mar. 16: The annual meeting of the Mammoth Mining Company, at which 237,057 shares were represented, was held yesterday afternoon in the office of Bennett, Marshall & Bradley, and the old board, with slight changes, was re-elected. Following are the directors: Wm. McIntyre, H. P. Mason, J. A. Cunningham, Wm. M. Bradley, F. E. Goodhart, W. S. McCormick and L. S. Hills. Wm. McIntyre was elected president; J. A. Cunningham, vice-president; L. S. Hills, treasurer; and J. Fred Corker, secretary. The matter of the appointment of a superintendent was left with the board, with the understanding that, if they could agree with G. H. Robinson, of the Drum Lummon mine, of Montana, as to terms, etc., he should be employed. The proposition of Mr. Goodhart, one of the heavy English stockholders, to the effect that the amount now in the treasury, and the proceeds from the ores now in sight in the mine, should be applied to the erection of a mill for the reduction of their low-grade ores, and that no dividends should be paid until the necessary funds for its erection had been realized from the mine, was unanimously adopted by the stockholders. The mill will have 40 stamps, and it will cost something like \$125,000. This includes the building of a separate pipe-line to the company's springs in Death canyon, a distance of about 15 miles. The water will be pumped up about a thousand feet at the springs, when it will run to the mill by gravitation. One of the directors, when asked when work would be resumed at the mine, said probably not until the company could get miners to work at \$2.50 per day.

Successful Patent Solicitors.

As Dewey & Co. have been in the patent soliciting business in this country for so many years, the firm's name is a well-known one. Another reason for its popularity is that a great proportion of the Pacific Coast patents issued by the Government have been procured through their agency. They are, therefore, well and thoroughly posted on the needs of the progressive industrial classes of this Coast. They are the best posted firm on what has been done in all branches of industry, and are able to judge of what is new and patentable. In this they have a great advantage, which is of practical dollar and cent value to their clients. That this is understood and appreciated, is evidenced by the number of patents issued through their SOLICITING FIRM Patent Agency (S. F.) from week to week and year to year.

Market Reports.

The Markets.

SAN FRANCISCO, March 23, 1893.

Fine silver sold in New York yesterday at 81 1/2 per ounce for the pure article 1000 fine. There were also sales in London at 37 1/2-66 per ounce, 925 fine. These quotations are a fraction lower than Tuesday, and the lowest prices at which the metal has sold during the present currency. Silver at 37 1/2 per ounce in London, which is practically the figure there to-day, is equivalent to 82 1/2 for the pure article, 76c for .925 fine, the English standard, 74c for .900 fine, the United States Mint standard, and 63 1/2 for the 412 1/2-grain dollar, which is now being turned out from the American mints. The cause of the present weakness is probably the completion of the Government purchases for the month, coupled with the impression that other countries are going to let the United States work out the problem of maintaining a parity between the metals alone. The established parity under which the coin is now being turned out means 59d per ounce. The present price shows a heavy discount on the parity price.

Several friends of silver coinage in the Senate claim to have positive assurances from President Cleveland that he will send a delegation to Brussels in May to represent the United States at the International Monetary Conference, and that he has already taken steps to notify the various nations taking part that our Government would be pleased to have them again represented. Allison and Teller are reported to have received these assurances.

It is not improbable that Teller will take the place of Jones of Nevada, as the representative of free-silver Republicans on the delegation from this country. Allison has refused positively to return to Brussels and Jones does not desire to go. The President will designate a Democrat in accordance with his views on the silver question to take the place of Allison. Among the names suggested as the possible choice are J. Edward Simmons, a prominent New York banker; ex-Comptroller W. L. Trenholm, and ex-Secretary Fairchild.

QUICKSILVER.—Of late there has been a larger movement in quicksilver. The shipment of 280 flasks to Prescott, Ont., recently was notable in adding another destination to the export list. New York has taken 1000 flasks so far for this month and Mexico 375. These quantities are exclusive of whatever shipments have been made out of the State by rail.

Mining Share Market.

Business has been a little better this week than last in mining-stock circles, but transactions have not been large. Quite a number of assessments have been levied of late on Comstock mines, but the amounts are smaller than has been customary. It is probable the directors think they will be more apt to collect the whole amount if a small assessment is made, than if 25 to 50 cents a share is called for. Many of the companies lately have had hard work to collect their assessments, and have had to take in the stock themselves when delinquent.

Thomas T. Atkinson of the San Francisco Board has proposed an amendment to the by-laws of the exchange, whereby transactions in stocks selling at 50 cents or less can be traded in on a difference of 50 cents per share. Even considering a proposition of this kind shows what little there is left in the business.

A large number of recently discharged miners from the Comstock mines are in this city and are daily seen in Pine street and Pauper alley.

It is currently reported that Harry M. Gorbam is to manage the new bank which Hon. J. P. Jones is to start at Santa Monica.

Judge Sanderson's decision that a seat in a Board is not subject to taxation is very pleasing to the brokers, although some of them have already paid the tax for the past year. The Supreme Court will have to decide upon the matter.

- 493,345.—FIRE-LADDER—J. M. Wallace, Portland, Ogn.

The following brief list by telegraph, for Mar. 21, will appear more complete on receipt of mail advices:

California—Anthony Fereva, Nelson, Self-cleaning screen; Andrew Gamble, Nordhoff, almond or walnut filler; Elsiea Hayes, Sacramento, metallo lathing; Harry M. Little, Rivera, cultivator; John C. Lock, San Jose, two patents for car couplings; John McMullen, H. Krusi and H. S. Wood, San Francisco, canal digger; Dennis O'Leary, Winchester, lid-holder; Theodore A. Schluter, Oakland, oil can or other liquid receptacle; William H. Vance, San Francisco, folding grate front and hearth.

Oregon—John J. Burko, Roseburg, railway cattle guard; Edward N. Gannon, assignor to himself and J. G. Hewison, Portland, two patents for a funnel; Ira L. Martin, Amity, feed box.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast Inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Assessment Notices.

SUPERIOR MILL AND MINING COMPANY. LOCATION of principal place of business, San Francisco, Cal. Location of works, Placerville, El Dorado County, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 15th day of February 1893, an assessment (No. 1) of five cents (5c) per share was levied upon the Capital Stock of the Corporation, payable immediately in U. S. Gold Coin, to the Secretary, at the office of the Company, Room 2, No. 323 Front St., San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 20th day of March, 1893, will be delinquent, and advertised for sale at public auction, and, unless payment is made before, will be sold on Wednesday, the 6th day of April, 1893, at 1 o'clock P. M., to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.
I. N. WITRUGH, Secretary pro tem.
Office, Room 2, No. 323 Front St., San Francisco, Cal.

POSTPONEMENT.

At a meeting of the Board of Directors of the Superior Mill and Mining Company held on the 23rd day of February, 1893, the day of delinquency in the above assessment was postponed to April 3d, 1893, and the day of sale to MONDAY, April 24th, 1893, at the same hour and place.

BOOKS ON ASSAYING.

By C. H. AARON.

Part I.—Gold and Silver Ores.

SECOND EDITION—PRICE \$1.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:

Preface; Introduction; Implements: Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Lignite; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assay; Examples of Dressing; The Melting in Crucibles; Scorching; Cupellation; Weighing the Lead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 130 12mo. pages, with illustrations well bound in cloth; 1893. Price, \$1, postpaid. Sold by DEWEY PUBLISHING CO., Publishers, No. 220 Market Street, San Francisco.

Parts II and III.

Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Etc.

SECOND EDITION—JUST OUT.

Price \$1.75.

This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.

Table of Contents:

Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Humid Assay of Silver; Olay Lucas's Method; Volhard's Method; Manipulation; Lead Ores; Copper Ores; Tin Ores; Mercury Ores; Zinc Ores; Nickel and Cobalt; Chromium; Bismuth; Arsenic; Antimony; Sulphur; Salt; Note.

One of the methods given for the Assay of Copper is new, original and exact, as is also one of the processes for Zinc.

The book contains 151 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter.

Price, postpaid, \$1.75. Sold by DEWEY PUBLISHING CO., Publishers No. 220 Market St., San Francisco.

A New Electric Vapor Motor.

In the early part of last year we illustrated a gas or gasoline engine used for motive power (the invention of Daniel Best of San Leandro, California,) which has been used in hauling street cars from San Jose out towards Alum Rock, about eight miles, and which is still in use on that suburban road. We herewith give an engraving of one of the latest inventions of Mr. Best which has been named an electric vapor motor.

This motor was built to run on a street railway line between Yuba City and Marysville, California, a distance of four miles. After its completion a number of newspaper reporters visited San Leandro to witness its work on a short line of railway built for experimental work. An hour of severe trial under the exacting conditions proved its capacity and adaptability for street railway service. This motor will gain a high rate of speed within a very short distance and can be checked within a few feet. The motor is enclosed in a car and when the doors of the car are closed little or no noise can be heard ten feet away. An admirable feature of this motor is the system by which it can be thrown in and out of gear without causing a jerk or jar. The expense of this motor in running is small. In comparison with horse power, electricity, cable or steam power it is claimed by the inventor that it does not on an average cost one-third as much as the cheapest of these. It is easily handled by one person and its simplicity of construction makes it inexpensive to keep in repair.

The mechanical features, which are shown in the engraving, are covered by several patents. The connecting rods from the pistons are attached to cranks on the main engine shaft and this shaft connects direct with the forward car-wheel axle by an endless steel roller-chain, passing around sprocket wheels on the shaft and axle. Another chain passes around a sprocket upon the rear axle and a sprocket upon a counter-shaft, driven by an intermediate gear from the main engine shaft, and by means of a clutch mechanism, one set of wheels may be driven directly from the engine shaft to propel the car in one direction, while the others are disengaged from the shaft and run free. By changing the clutch the first set is thrown out of gear, and the others are engaged so that the car will be driven in the opposite direction. The number of revolutions of the engine per minute is 200, and of the

car-wheels (diameter 30 inches) is 100; this giving a speed of eight miles per hour. This speed can be changed by the operator from 75 to 250 revolutions per minute.

The speed of the engine is controlled by a simple ball governor that governs the amount of gas required, as well

exhaust from the engine may discharge beneath the car, or, preferably, through pipes above the top of the car, so that no odor is discernible by the passengers. The inlet and exhaust valves are separately actuated, the exhaust being controlled by the governor, which acts directly upon

that instead of the inlet valve. Last week this motor was shipped to Marysville, where its capacity and adaptability was fully tested. Its advent was hailed with joy, and the local papers have long, commendatory articles on its efficiency in pulling a large trailer loaded with passengers, on short curves and heavy grades, without diminution of speed. The local endorsement was universal as to its excellence and capability, and several more motors will be immediately built for this road.

The question of rapid transit on street or suburban roads is a very important one, which is attracting the attention of inventors. High rates of speed on this class of roads must, however, be coupled with the element of safety to passengers, and the cars must be under control as to quick starting and sudden stopping. This is a feature to which Mr. Best has given special attention, and in which he has been successful. Cheap and efficient motors for outside street, suburban and country railroads will make a decided change in existing conditions. The crowded portions of cities will be relieved, since accommodations can be given further from the centers and yet there will be convenience of access. In the country regions speed may be attained and the roads be built and operated at less cost than by steam or electricity, in which systems expensive plants are required. These electric vapor motors are specially adapted for suburban roads, owing to their economy and efficiency.

THE Government Commission to take action under the Caminetti law has been appointed. The U. S. Engineers selected are Col. Mendell, Lieut.-Col. Benyard and Major Heuer, all residents of San Francisco, and familiar with

this subject. Major Heuer and Col. Benyard were both members of the Debris Commission which reported to Congress on hydraulic mining in California, and it was on the basis of that report that the Miners' Association was organized and the Caminetti law enacted.

REPORTS have been received of new placer diggings in the southwestern part of Maricopa county, Arizona, about 30 miles north of Agua Caliente. Water is scarce.

BEST'S MOTOR AND CAR.

BEST'S ELECTRIC VAPOR MOTOR.

as governing the igniting device. This motor is operated from either end, it not being necessary to turn to run in an opposite direction. It can back or forward, stop or start, at the will of the operator. Either set of driving wheels can be brought into action by a simple movement of the reverse lever. The engine is double, as shown by the engraving. The gasoline is carried in a tank concealed in the roof of the car and brought down by pipes to the generator, and from thence to the engines as needed. The

Meadow Lake Ores.

"Dan de Quille" recently published a letter in the *Engineering and Mining Journal* recounting the difficulties met with in treating the auriferous veinstone of Meadow Lake district, Nevada county. In an editorial referring to the letter the *Journal* says the specimens submitted appear to be a silicious hematite—and suggests, that a large percentage of the gold in that and the sulphurets might, be extracted by barrel chlorination, if an oxidizing agent such as nitre cake, is used.

In those portions of the different fissure occupied by auriferous veinstone in the Meadow Lake district, the gangue besides the quartz, consists of a large proportion of iron pyrites, and sphalerite (zinc blende) and some arsenical pyrites. The pyrites when exposed to the atmosphere, on the different croppings, became decomposed, and the melting of the snow carried away the decomposition leaving the free gold in the quartz, the assays from which gave such deceptive results.

When the vein-matter was sunk upon to a depth of some thirty or forty feet the undecomposed iron pyrites and zinc blende was met with again—the zinc blende rendering chlorination even in barrels a difficult matter. At one time seven mills were erected, and some 30 different processes tried. The great trouble, however, was the small proportion of gold in the vein-matter. One of our old correspondents remarked "That the big town was built up by high assays and let down by working results."

The *Journal* intimates, because we have failed to make a success with Meadow Lake ores, that California is behind the rest of the world in metallurgical methods: that we know nothing of the "barrel process" which is achieving such great results. As California happens to hold the record for cheap working of gold ores, the criticism amounts to little. Moreover, we do know of the barrel process, but know also that neither this nor any other process can make barren rock yield gold. The real difficulty with Meadow Lake ores is the fact that they do not contain the amount of gold reported. Experienced metallurgists have very carefully examined the whole district and its ores. The place has been abandoned for years. Old man Hartley, the last to stay, and who spent many dreary winters there, is dead; and this winter for the first time in 25 years there was not an inhabitant in Meadow Lake. That Californians are pretty good gold miners is attested by the fact that they are in demand all over the world and may be found in charge of the principal gold mines, wherever gold mining is carried on. Of course there is some gold in Meadow Lake ores, but the proportion is so small it will not pay to work them by any means as present known. If the "barrel process" people can make a success with these ores it would pay them to make the trial, for the mines in the present condition are of no value

whatever. But the California men are not going to the expense of any further experiments in this direction; that will be left to the owners of the patented process.

The Hydraulic Mining Laws.

The miners throughout the State are jubilant because Governor Markham has signed all the bills which are favorable to the mining industry. The Ford Hydraulic Mining bill, the Debris Commission bill and the Mining Bureau bill are now laws. On the first of these bills there was much discussion and opposition. After it was passed the Anti-Debris Association made a bitter fight before the Governor to have it vetoed. The Miners' Association, however, sent committees and the Governor heard the arguments of both sides. The result was that he signed the bill and it is now the law of the State. This is considered the most important of the laws passed at this session of the legislature as far as mining is concerned. It is very brief and is as follows:

SEC. 1424: This business of hydraulic mining may be carried on within the State of California wherever and whenever the same can be carried on without material injury to the navigable streams, or the lands adjacent thereto.

SEC. 1425: Hydraulic mining, within the meaning of this title, is mining by means of the application of water, under pressure through a nozzle against a natural bank.

This, as well as the Debris Commission bill was introduced in the Senate by Senator Tirey L. Ford, of Sierra, Plumas and Nevada counties and Mr. R. I. Thomas of Nevada county introduced them in the Assembly. In order that the miners of the State should have a clear understanding of the effect of these bills upon their industry the editor of the MINING AND SCIENTIFIC PRESS has interviewed Senator Ford and his statements are here appended:

"What effect do you think the legislation during this session of the legislature, and especially these two laws of yours, Mr. Ford, will have on the hydraulic mining in this State?"

"Senate bill No. 150, defines the conditions under which hydraulic mining may be conducted. The purpose of this bill was to embody in our civil code the principle that had been established concerning the business of hydraulic mining by our State and Federal courts. As you will remember, the latest expression of judicial opinion on this subject was the decision of the U. S. Circuit Court in October last in the case of the United States against the North Bloomfield Mining Co. The U. S. Circuit Court in that case, after hearing the evidence and the argument, and a personal inspection of the premises by the justice of the court, decided that mining by the hydraulic process could be prosecuted by this company and refused to issue an injunction. The practical effect of that decision was to dissolve a former injunction that had been issued by Judge Sawyer. This former injunction was the result of the famous suit known as Woodruff vs. North Bloomfield Mining Co. This last-named suit is the one upon which is based the main reliance of the Anti-Debris Association, and in all their discussions they quote from Judge Sawyer's opinion in that case and make it the basis of their arguments. The decision of last October by the same court, in a case where the same company was defendant, without overruling the decision of Judge Sawyer, did lay down the rule that not only could hydraulic mining be carried on without material injury to navigable streams and adjacent lands, but that, in fact, one of the largest hydraulic mines in the State of California had actually constructed such restraining works as enabled this very result to be accomplished. The justice who rendered the opinion stated (and this opinion can be readily obtained) that although the water leaving the restraining works was discolored and contained fine particles of comminuted clay, it did not contain or carry any such material as would be deposited in a navigable stream or anywhere when carried by water traveling at the rate of a mile in two hours, and that such material as was carried in suspension in water leaving this mine would be carried through San Francisco Bay to the Pacific Ocean. Senate bill No. 50 contains the principle of this decision boiled down and crystallized into a code section."

"Was there anything in the code prior to this prohibiting hydraulic mining?"

"No, the codes, heretofore, have contained nothing with reference to hydraulic mining. The whole law concerning the business of hydraulic mining was embodied in numerous decisions of the State and Federal Courts, and our State being a Code State and it being the policy of our State to embody all well-known legal principles in our code, and the law governing hydraulic mining having at last become settled by the courts, it was deemed advisable to enact into a code section the principles thus established."

"It will be readily seen that this legislation is very conservative in character. It gives the miner no rights beyond those given him by the decision of the U. S. Circuit Court last October in the North Bloomfield case, but it does

definitely determine the conditions that may be imposed upon the hydraulic miner, the rule of evidence that must govern in cases involving this industry, and puts the law into a definite and fixed form and in a code section where all may read and understand it. It places the business of hydraulic mining among the legitimate industries of our State, where it rightfully belongs and, it is hoped, will tend to put an end to the controversies that have heretofore been detrimental to both mountain and valley interests.

"I might add here that the apparent fear of some of the valley people that this provision may encourage the illegal prosecution of hydraulic mining is wholly without any reasonable foundation. The very law itself prohibits, in effect, any hydraulic mining except such as can be carried on in compliance with its terms, and, as every lawyer in the State of California knows, the code provision is strictly in line with the judicial rulings of our State and Federal courts. Curvalley neighbors must give the miners of this State credit for possessing at least a fair amount of intelligence, and their former obedience to laws that wrought havoc and ruin in their midst is a sufficient guaranty that they will abide by the conditions imposed by this, or any other, legal enactment.

"A definition of hydraulic mining was made necessary by the terms of the so-called 'Caminetti Law.' That act provided that the term 'hydraulic mining' should have the definition given to it in the State of California. That portion of Senate Bill No. 50 defining hydraulic mining meets the requirements of the 'Caminetti Law' in this respect."

"What is your opinion, Mr. Ford, in relation to the bill providing for the Debris Commission?"

"That bill, known as Senate Bill No. 389, is wholly and strictly supplemental to the 'Caminetti Act.' It provides that the Governor shall, on or before the first of next January, appoint a Debris Commissioner. This Debris Commissioner has authority to appoint a secretary. The bill further appropriates \$250,000 to be used in the construction of restraining works for the purpose of restraining mining debris. This appropriation, however, does not become available until Congress shall have appropriated at least as much for the same purpose. But when Congress does appropriate that amount, and as much more as it pleases, then this appropriation will become available and must be expended under the direction of this Debris Commissioner. All expenditures under this act are to be subject to the approval of the State Board of Examiners. The intention of the act is to enable California to co-operate with the general government in the construction of works necessary to permit hydraulic mining to be carried on under restrictions and limitations imposed by law."

"Mr. Ford, do you not think, in view of the passage of these laws, both in Congress and in the State Legislature, that the conditions are much more favorable for hydraulic mining than they have been since the original North Bloomfield decision?"

"There is not the least doubt of it. By this legislation both the State of California and the General Government are committed to a policy which cannot result otherwise than beneficially to the business of hydraulic mining. California has said that she will give \$250,000 to aid in the rehabilitation of this industry, provided that the General Government will give at least as much. California has now, through her Legislature, named the conditions upon which hydraulic mining may be resumed, and has shown her willingness to assist hydraulic miners in making it possible for them to comply with these conditions. The General Government, while it has not as yet gone as far as California in this direction, has started out by recognizing the industry and providing legal machinery whereby it may be resumed. The only thing involved now is for the Federal Government to meet the invitation of California and appropriate a sufficient sum of money to construct the required works to enable this industry to be resumed. I should say that the outlook is particularly encouraging. True, our miners must be yet a little patient. They must not for a moment imagine that enterprises of this nature and work of this magnitude can be accomplished in a day. We have gone a long distance in the right direction, and, if the miners are united, firm and persistent, they will get what they are entitled to. There is one imperative necessity. The miners must keep up their organization. Through the State Miners' Association and its branches, they have accomplished what has been done by way of legislation in both Congress and the State Legislature. Too much praise cannot be bestowed upon that organization, its executive committee and its officers. I should like to name personally some members of that association who have done heroic work for the miners, but it is hardly proper for me to do so on this occasion. Suffice it to say that in the Miners' Association, in its prosperity and in its success, lies the success of the cause of the miners. For years the miners have been fighting single-handed and individually against powerful organiza-

tions composed of the best men of the valleys, backed by abundance of means and the best counsel they could employ. Now, for the first time in the history of California, the miners have an organization officered by some of the best men of our State, the result of whose work has been such legislative fruit as two years ago was not dreamed of by the wildest mining enthusiast. I wish all of the miners in California could thoroughly appreciate the good work done by their association and the necessity for their continuous and enthusiastic support of it."

Refrigerating Machinery.

The Vulcan Iron Works shipped this week to the Gambrinus Brewing Co., of Portland, Or., a 35-ton Vulcan horizontal refrigerating machine, the first of this design built on this coast. It is driven by a "Vulcan" Corliss engine. The machine is double-acting, compressing at each end of the stroke. These horizontal machines are preferred by many to the vertical type, as there is no necessity for a platform, and the attendant does not have to climb to get at the valves, engines, etc. The Vulcan people have taken special trouble to provide ingenious methods for circulating cool oil through the stuffing-box to prevent heating of the piston-rod. The ammonia cylinder is completely jacketed to provide water circulation. This new design is particularly adapted for the larger sizes of refrigerating machinery. Everything about the machinery is strong and substantial to stand the high pressures necessary. The whole plant, as far as machinery is concerned, was designed and built in this city.

The Vulcan Iron Works are putting a cold-storage room in the steamship Umatilla for the benefit of all shippers needing cold-storage accommodation. They are also making a plant for the Castle Crag hotel, Shasta county. Another plant is being built for the Syndicate Breweries at San Diego.

The refrigerating business is getting to be quite an industry on this coast. There is, in many lines, an increasing demand for refrigerating plants and ice machines. The Vulcan works are making a specialty of this class of machinery and extending their business in it all over the Pacific slope, from the far north down to Central America. They have equipped salmon canneries in British Columbia and furnished ice machines for Salvador. The operation of the Vulcan machines is simple and cheap, and they have various designs suited to different purposes, for both large and small plants. The refrigerating plants are used for breweries, markets, canneries, packing companies, hotels, etc.

The Late Henry De Groot.

Dr. Henry De Groot was killed in Alameda on Tuesday by the Santa Cruz train. He was standing close to the track reading a newspaper and did not hear the approaching train. The whistle was blown and engine reversed, but the Doctor was struck by the locomotive and died within a few hours. The body was not mangled, the guard of the locomotive having struck him on the head, throwing him aside.

No mining man in California was more widely known than Doctor De Groot, for he has visited every camp within its borders and has been a writer on mining topics since mining commenced here. He was a pioneer of pioneers, having been sent here in 1848 by Horace Greeley, of the New York *Tribune*, to verify the reports of the discovery of gold. He was probably the first newspaper man on this coast to get an "interview," for he went to Sutter's mill and, on behalf of the *Tribune*, interviewed General Sutter, Marshall, Mrs. Wimmer and others directly connected with the discovery of gold. His letters were widely read, giving as they did the first detailed, authentic accounts of the gold fields of California. Dr. De Groot returned "to the States" for his family, and came back to California, via Panama, in February, 1850.

Since that time he has been closely identified with the mining industry on the Pacific Coast. Every district and camp in California and Nevada has been visited by him. At one time he accumulated considerable money but lost it in mining operations. He was among the first to go to the Comstock and was a pioneer in Reese River, Cortez, Eureka, Pioche and other Nevada districts. In several camps he established newspapers. He was one of the most notable followers of mining excitements, having gone to Gold Bluff in 1851, Kern river in 1854, Fraser river, Washoe, Reese River, Aurora, Meadow Lake, White Pine and other camps when discovered.

For many years he has resided in San Francisco, making occasional trips to the mountains on mining business, but depending largely upon his pen for his support. In addition to writing on mining subjects in the daily papers, he wrote for technical journals, the State Mining Bureau and U. S. Geological Survey. He has been a frequent contributor to the MINING AND SCIENTIFIC PRESS for the last thirty

years, and has, during the past twenty years, taken the editor's place during vacations and other absences from the desk.

There was no better-posted man on the mining industry of this coast than Dr. De Groot. Having visited in person every district and camp in California, he was well known everywhere among the miners and was always welcome in their cabins. He would walk from camp to camp and post himself thoroughly on the country. At the time of the existence of the old Hydraulic Miners' Association he was assistant secretary, and visited all the hydraulic mines in search of data. In this branch of mining he was particularly well posted. During Ralston's time he did a great deal of mine-experting for the Bank of California, and has followed this branch of work, in connection with gravel mines, for a long time.

Dr. De Groot was a peculiar man in habits and in dress. He always wore a single-breasted, long frock coat and a broad-brimmed, white hat such as the early miners adopted in California. He had strong prejudices against liquor and tobacco, and never used either. He was liberal and generous to a fault, giving away his money even when in greatest need of it himself. With any old miner he would divide what he had, or give away all, if asked.

Dr. De Groot was 75 years of age, but maintained his mental and physical faculties in a remarkable way. He was actively at work up to the day of his death. No men in his sphere did more for the mining industry. He was its earnest friend in every way, and his writings have benefited it to a great degree. The Doctor was a companionable man of cheerful disposition, unselfish, and willing to do everything possible for a friend.

Coast Industrial Notes.

THE Mere Island Navy Yard is to spend \$20,000 for dredging along the water-front.

A THICK SAMPLE of first quality mice from which sheets six by seven inches square can be cut was recently brought up from the Yellow Pine country, Nevada.

THE high water destroyed \$4000 worth of salt for Shaefer Bros.' works at the north of San Diego bay, where the Otay and Tia Juana rivers empty on each side.

A 55-FOOT DAM, belonging to E. W. Scripps, on the Miramar ranch, Linde Vista district, San Diego county, was broken down by the high waters last week.

THE Visalia *Delta* is urging the establishment of a cannery for that place, claiming that the large fruit product of this and succeeding seasons will amply pay for its erection.

LOS ANGELES is crowded with Eastern people, and two new buildings, the Stimson and Bradbury blocks, are being put up. They will be finer edifices than the Crocker building in this city.

SUPERINTENDENT REEDY of the Idaho Stage Line has arrived at Ukiah with the news that the late rains have unfitted for use both approaches to the new \$18,000 iron bridge over the main Eel river near the Humboldt and Mendocino county lines.

THE people in Piedmont district back of Oakland intend to have a fine sewer system if money can make one. They are about to hold an election to decide whether bonds shall be issued for \$40,000 for improvement. The election will be held on April 22d.

A DISPATCH from Gila Bend, A. T., says: The Wolfey canal is completed and with the present rise of the Gila ran six feet of water. The overflow washed out the upper portion of the dam, and it will take several weeks to repair the damage, though it is not so serious as was at first reported.

THREE IMPORTANT CO-OPERATIVE INDUSTRIES have been organized in Gilroy. They are tobacco culture and cigar-making; the manufacture of tubular boilers, steam vats for dairies and agricultural machinery, and the manufacture of flour. All give promise of success and the year's outlook is a prosperous one.

THE Cudahy Packing Company has purchased the Nadeau land near Los Angeles for \$197,000, and is now spending \$800,000 building slaughter-houses such as those conducted by Armour in Chicago and Baden. Already the different counties in the south are placarded with announcements that the company will buy 500 hogs daily after May 1st.

THIS has been the grandest season, with but trifling exceptions, ever known to Siskiyou county, and mining and agricultural industries should be more than satisfied. Plenty of rains in the valleys and snow on the mountains are bound to bring good reward, both to the miner and farmer, and stock men have reason to rejoice because of the continuous mild winter, with its entire lack of high winds or storms.

LABOR COMMISSIONER WATTS who has been visiting the southern part of the State in search of information on the labor question, states that there are fewer unemployed men in the vicinity of Los Angeles than in this section, which he claims is partly due to the fact that Los Angeles supports, under the conduct of the Labor Assembly, a free employment bureau, which has helped considerably those seeking work. Mr. Watts greatly favors this plan.

THE explanation of the report from San Francisco that the Secretary of the Treasury has refused an offer of \$1,000,000 in gold, and that he would not consider any more offers, is given as follows: The banks of San Francisco offered the Government \$1,000,000 in gold in exchange for currency in New York. The Secretary de-

clined the proposition because it would involve the cost of transportation to the East and it meant for the California banks exchange free of cost. The Secretary will not refuse offers of gold where the terms are not to the disadvantage of the Government.

THE Columbia river cannery men decided to offer fishermen the old price of \$1 per salmon for the coming season, which will begin April 8th. The Fisherman's Union will consider the offer. About half the canneries were represented at the meeting. The up-river canneries of Cook, Warren, Harrington and Winter and Hapgood were not represented. The new can factory established at Astoria by San Francisco parties has already received orders for the entire supply of three canneries.

NEXT WEEK, at Mare Island, the monitor Monadnock will be hauled up under the 100-ton shears, where she will lie for a while for the purpose of having her boilers put in. The boilers have been hauled down from the boiler-shop and present a fine-looking appearance. Those who have inspected them pronounce them to be the finest piece of work that has been turned out from the shops. The military mast is lying on the forward part of the deck of the monitor and will also be placed in position.

ONLY a little more than a month now remains in which the 20,000 Chinese in this city may comply with the provisions of the Geary law and register themselves. Should every one of them disobey the mandate of the Six Companies and present themselves for registration, not half of their number could be accommodated. But there are no signs of a break in the ranks of the Mongolians, and the treasury officials at Washington have evinced a determination to stand by the action of the last Congress in the matter. Hence a wholesale deportation seems near.

A LARGE DEPOSIT of gypsum has been discovered at Coalinga, Fresno county, and an analysis shows it equal to the best. Extensive preparations are made for opening it. The San Joaquin Valley Coal Mining Company has secured the property and mill and crushing works are now being erected on the grounds. Workmen are taking out large quantities of gypsum. The fields lie in the Coast Range mountains in the vicinity of the oil fields. The railroad runs within a short distance of the deposits and the coal mines are at hand furnishing fuel for running the mill. The first carload of gypsum will be shipped from the mill in a few days. It will be used to fertilize land and neutralize the alkali.

THE ship Oimara from Calcutta brought for the San Quentin prison 4500 bales of raw jute worth \$50,000. When the present cargo of raw jute is landed safely in San Quentin there will be in the prison at that place, uncovered by insurance, 1,500,000 manufactured grain bags, worth \$90,000 at the lowest price for bags to-day, and \$60,000 worth of raw jute, or a total of \$150,000 worth of inflammable property. There is in all 120,000 bales of raw jute purchased and due at San Quentin prison within the coming eighteen months, outside of the manufactured bags now on hand, and the Prison Directors are worrying a good deal about its being uninsured. The law does not permit the insuring of State property.

THE Metropolitan Electric Road has received three of its large new open double-ender electric cars and they were placed on the road running from Eddy and Powell streets to the park. The cars are of a dark walnut color. The interior is entirely open, excepting for a partition which separates the two dummies, rear and front. The interior seats will hold twenty persons, while the dummies will hold sixteen more. Additional cars of the same pattern will soon be put on. A number of closed double cars are also being built. As soon as all these are received cars will be run regularly on the branch from Page street via Carl street to the Olympic Club grounds, which the company has been unable to operate as yet owing to the heavy travel on the Page-street line.

SAN FRANCISCO shipped by sea last year 21,332,500 feet of lumber valued at \$495,500. The principal markets now for lumber are the United Kingdom, Australia, Central America, Mexico, Hawaiian and other Pacific islands and South America. Europe was added to the list in 1883. Occasional shipments have been made to New York by sea, and considerable lumber is also sent by rail to the Eastern cities. The large lumber interests in Oregon and Washington are practically controlled by California capitalists, and most of the export orders are received in San Francisco, though the vessels are loaded at the mill ports at the north, at Eureka, Humboldt county, on the Columbia river and at Puget Sound ports.

THE American Ship-Windlass Company of Providence, R. I., has secured the contract to furnish the Mare Island Navy Yard with a forty-ton traveling crane for \$55,866 23. As the appropriation made by Congress was \$60,000, the remainder of the money will be expended in laying the track around the coping of the dock. By the time the crane is in place the armor for the Monadnock is expected to arrive. She will then be put in dock and by means of the crane the huge sheets of metal will be hoisted and lowered in position on the sides of the fighting craft. The machinery is now well under way in the shops and the work of assembling each part is going on all the time. The large iron knees for the bridge, located on the forward part of the superstructure, were set in place a few days ago.

THE dam of the Gila Bend Irrigation Co., 60 miles southwest of Phoenix, A. T., was washed away during the recent high water on the Gila. The damage is estimated at \$100,000. The rise in the river was not an unusual one, the trouble lying in the faulty construction of the dam. It was constructed between high, rocky walls, several hundred yards in width, and in the channel, where the water ran with terrific force, a large, well-built canal has been constructed to carry the water around on the lands above Gila Bend, but it was never filled, though thousands of acres of grain and fruit have been put in this spring in anticipation of abundance of water. The site is a grand one for a dam and the water supply is ample. It is believed that a proper dam will soon be put in place of the one destroyed.

The Price of Silver.

TO THE EDITOR:—Will the price of silver rise or fall? That is the question which is agitating the minds of many people at the present time. I think it will probably do both, falling first and then rising slowly.

The British Government is said to hold the key to the situation, and it does not seem disposed to extend the utilization of silver in the form of coin. Our own Government appears to be in a similar mood, despite the existence of a strong party which favors a different course. Moreover, I do not believe that the remonetization of silver by those and other Governments would alone suffice to restore that which is (facetiously?) called "parity," though it would no doubt help toward such a result.

Legislation may affect, but cannot control, commercial values. If all the Governments should decree a ratio of silver to gold as 16 to 1, the result would be either a commercial discount on silver coin (or a premium on gold, which is the same) or gold would be hoarded and become a tradition in commerce.

The statistics of recent years show an increasing production of both gold and silver, throughout the world at large. In 1892, the United States is reported to have produced silver to the value of about sixty millions of dollars, reckoning at the rate of 87 cents per ounce as an average price for the year, against thirty-three million dollars in gold. Australia produced a little more gold than California, but Australia is also a large producer of silver. Mexico produces more silver value, at present prices, than gold value, while the reverse is true of Africa and Russia. On the whole, the output of silver, at the comparatively low average price of 87 cents, is in excess of that of gold.

If our Government shall stop purchasing silver as it is now doing, and especially if it should decide to sell the stock on hand, as some think should be done in order to force (!) Great Britain to change her policy, I think the price of silver must fall, perhaps heavily; but the lower it falls the more rapidly will the production diminish, and this must cause it to rise again in time, perhaps to be again lowered by overproduction.

The value of the precious metals is to a great extent conventional; it does not grow out of any real necessity, as does the value of iron, for example, and the specific value of silver—that is, its value per ounce—may, I think, be looked on as the quotient of an aggregate divided by the number of ounces available, that aggregate representing the estimation in which the world holds silver in its totality; it is not a fixed quantity, but its mutations are controlled largely by caprice, and are, therefore, in a measure, independent of the laws which govern the demand for more useful products.

Cheap as silver is considered to be, it is not cheap enough to be considered as one of the very useful metals, like copper or lead; it is not one of those things which we *must* have; its chief employment, otherwise than as coin, is for purposes of ornament and luxury, for which purposes facility of acquisition is a disqualification, not an inducement to larger consumption. Moreover, for ornamental purposes, and even for useful purposes, it is largely superseded by nickel, which is cheaper and in many cases better, by various alloys, and by gold, which is now within the reach of many of the class which in former times was satisfied with silver. Who, in this country, now wears a silver ring or chain? When good wine is cheap, people drink more of it, but the cheaper silver becomes the less will it be in demand for some purposes. Again, silver is not perishable like potatoes, nor is it immediately destroyed by use like wine.

Wine and silver are both, in the main, luxuries, and as such may be compared. The comparison, however, shows this important difference: that while wine is completely destroyed by use, and while such use promotes further consumption, silver is not usually consumed, but remains to give pleasure to its possessor, so that the person who has once gratified his desire for a bauble, such as a silver punch-bowl or teapot, is not likely to want another for many years, if ever. For these reasons the stock of silver tends to accumulate easily and the accumulation is disposed of but slowly, even if not maintained or increased by the supply.

The need of coin does not increase with the growth of population and the extension of industries—that is, not in the same proportion. The reason is that, in the transaction of the world's business, coin, a semi-barbarous device, the first step in advance of simple barter, is largely superseded by the system of clearing houses and other contrivances of advancing civilization. If all the world were honest there would be no need of precious metals for coinage. It is indeed, as another writer has said, a pitiful thing that one set of men cannot exchange the products of their respective industries unless another set of men waste their lives and energies by toiling in dark, noisome holes in the ground for metals which are otherwise not worth the pains; but we must take the world as it is, not as it may be. Yet, as I have said, the use of coin is in part superseded already by that of more civilized devices.

By common accord of the chief nations for ages gold has been the ultimate standard of value. It is not a perfect standard, for it moves. A tide-gauge which should itself rise and fall would give a false record of the ebb and flow of the waters. The ancient sages puzzled their heathen brains in a vain endeavor to find a criterion of truth, and in our own day a "perplexed philosopher" has brought all the resources of his immense learning, all the power of his eloquence and all the force of his logic to the task of defining "absolute right," with a net result which would be ludicrous if it were not pitiful. So the scientist seeks an absolute standard of dimension and weight, and the political economist yearns for a changeless measure of value. For the latter some have proposed wheat, others labor, but nothing has been found to answer so well as gold, fictitious, conventional and mutable though its value is.

The effect of a fall in the value of gold is that other values seem to rise; but as other values are constantly

rising and falling in fact, a change in the value of gold is difficult to verify in any short period. The *price* of gold does not vary, because that price is stated in terms of gold, and it is clear that an ounce of gold must always be worth two half-ounces of gold. Now, the fact that gold has fallen in value since 1850 is proved by many other facts, and the tendency of that fall has been to raise the *price* of silver. Why, then, has the price of silver fallen? For the very same reason that the value (not price) of gold has fallen, namely, increased production (in a still greater degree). Many of those forms of wealth which are created by labor, which owe their utility and thus their value to labor bestowed upon them, as gold and silver do not to any great extent, have also fallen in price. Why? Because of increased facility of production and distribution; because of the advance of civilization which enables us to toil less or to enjoy more. Has the price of land fallen, in general? Has the wage of labor lessened throughout the world? No.

We hear a great deal about debtor classes and creditor classes, and we hear a good deal of rot. The fact is, that the man, or the nation, that contracted a debt many years ago, is the gainer to-day by the depreciation in the value of gold, and yet he wants to pay in silver, which has depreciated still more. A few hundred years ago, in England, a quarter of beef cost fourpence; to-day a pound of beef costs twice fourpence. Other common things were in proportion. This shows that money was worth more then than it is now, and, in like manner, though in less degree, money is cheaper now than it was forty years ago.

As to silver, its production must decrease for a time if its price is to rise much, and that will be the case. A certain rise will also come about from the greater production of gold, which must result from increased activity in gold mining, owing to the diversion of capital and labor from silver mining; but the increase of price thus caused will be fictitious—it will be an apparent rising of the tide from the sinking of the gauge. In the meantime, if the country needs more circulating medium, which I doubt, and is not civilized enough to use paper, which I believe, let our own silver be coined, either for what it is worth, in which case it will be "as good as gold," or for more than it is worth, in which case it will partake to a certain extent of the character of paper money, but without the destructibility of paper. This utilization of a large quantity of metal will help to raise the price in a legitimate way, but the silver should be bought in open market in justice to the people. (There is enough on hand now to occupy our mints for a long time, but that is in circulation by proxy.)

The value of coined silver may, for home use, have any relation to the value of coined gold that the law may give it, and I see no reason why a Government like this should not anticipate any probable rise in the price by giving it a legal tender value above the present price. If there should be, for a time or permanently, any apparent gain by so doing, that gain would be shared by the whole people. Such money would not pass at its face value in foreign countries, except, perhaps, such as could use it in the purchase of goods here, until an increased price of silver should bring it to par; until then it would be only hulloin, just as Mexican dollars, really worth more than our own, are not money, but only merchandise here.

My own interests incline toward increased activity in silver mining; hence, personally, I should be glad to see the metal commanding a high price. But I never allow personal interest, whether my own or that of another, to warp my judgment nor control the expression of my opinion. I consider the present depression to be the effect of overproduction, and I believe the demonetization of silver, by which the depression has been increased, was itself caused by the fears of financial disturbance resulting from the rapid production and impending fluctuations of value of the metal. Favorable legislation would help to raise the price, though whether such legislation is or is not desirable on other grounds, I do not pretend to judge.

Whether or not the demonetization of silver by these United States in 1873 was a wise measure, the fact remains that it was done; it is not so clear that remonetization, even if it could be accomplished, would restore the *statu quo ante*. As to California, the effect of the low price of silver is already felt in an increased demand for gold mines, and I have no doubt the present year will bring a considerable increase in the output of our mines, which should help us to bear the misfortune of our neighbors with Christian fortitude. Gold has always been good enough for Californians, and the faster we dig it out of the ground the sooner will the silver men be made happy by the restoration of the much-lamented "parity."

The learned are prone to fishing in deep waters for that which lies on the surface, and I fancy the silver question is more muddled than mysterious. C. H. AARON.

San Francisco, March 18, 1893.

The Silver Question.

SHASTA, CAL., March 20, 1893.

TO THE EDITOR:—In your issue of March 18th appears an article written by C. H. Aaron on the cost of silver. It gives correctly the condition of silver from a gold standpoint, and did not intend to show the reason why silver is debased as a money metal, but does, and in this way: "If we should all stop eating wheat and use corn instead, the price of wheat would go down and that of corn would go up, regardless of the cost of production." Just so. That is what has been done with silver. Let me change the wording, but not the meaning. If we should stop using silver and use gold instead, the price of silver would go down, while gold would come up, regardless of the cost of production.

That is what degraded silver as a money metal. By the demonetization of silver, the bullions parted value never to be equal until we use it as before. The bullion value of the silver dollar was greater than the bullion value of the gold dollar on the day it was demonetized. Then why was it done? What reason can be given for the act? The output of silver has increased since 1873, and so have its demands. It was demonetized to make way for an interest

bearing paper money issued by the national banks. This national bank money is well secured and is a good money, but too expensive. The scheme is to draw two interests on the same value. The bonds deposited with the United States draw interest; the national bank note based on these bonds is loaned out for another interest. This is drawing double interest on the same value.

John Sherman, being the chief schemer in this, says it is a good financial policy. If it is, then interest-bearing money issued by a corporation is better than gold and silver coin and gold and silver certificates issued by the Government of the United States that bears no interest.

But silver was demonetized to make way for the corporation money. Mr. Aaron writes about silver miners bawling "special clients." The writer has mined silver many years and did not know he should have one.

Again Mr. A. says: "Do the silver men think the world will pay more for their silver than they have to? No, they are not such fools!" That is not expected; neither are the silver men such fools as not to know what caused John Sherman to drop the silver dollar from the list of coins of the United States.

Senator Stewart of Nevada says it was accomplished in a manner no better than brute force. The more this question is studied, the plainer becomes this truth. Much has been written about the dishonest silver dollar by gold men. I would like to ask if it was not an honest dollar on the day it was demonetized? I would like to know if the bill demonetizing it was not put through Congress in a stealthy, sneaking and underhanded manner. Gen. U. S. Grant, at that time President, said he knew nothing about signing a bill demonetizing silver. James G. Blaine, speaker of the House, said he knew nothing of such a bill. These things must be proven false by the gold men, or silver will soon be placed where it belongs, as one of the money metals of this country.

Give us gold and silver coin, gold and silver certificates issued by the authority of the United States, and obliterate all other moneys, and we will not have too much silver or gold. J. E. BELL.

COL. C. F. CROCKER, in an interview in a New York paper says: "The Pacific Coast is going into manufacturing more heavily. We have new and large meat-packing establishments, furniture factories, iron foundries, extensions of wagon and carriage factories, etc. The recent sending of fresh fruit to Europe in refrigerated cars by express train and steamer was not unsuccessful. It was an experiment that taught those engaged in it what changes were necessary in order to make the reaching of the new market a success. It was learned that some improvements in the plan were to be made to preserve the flavor, the quality of the fruit while suspended so long in cold storage. A method for accomplishing this and securing the widened market will undoubtedly be found. Railway constructions within the State is going on continuously. Branch lines are being built to develop the valleys of California. A line is being run along the coast between San Francisco and Los Angeles, which cities have heretofore been connected by an interior route. It is quite probable that a new through railway system with the East will be carried through by the extension of some one of the principal railway lines from its western terminus to the Pacific. The systems that now have far-western termini have contemplated extensions to the coast and have surveyed the route, though no road is yet actually under construction."

THE miners at Nanaimo are worried over a visit of John Rosenfeld who has the controlling interest in the new Vancouver coal company. This visit is generally believed to have been caused by the necessity of a reduction in the miners' pay in order to make the collieries compete profitably with other similar concerns. The Rosenfelds handle almost the entire output of this colliery. Lately, owing to a poor market, low freights from England and Australia, it is said they have been losing money. If they are to continue to handle the Nanaimo product it must be delivered at San Francisco cheaper; therefore a reduction in miners' pay is necessary; otherwise the mines will be closed down, resulting in the collapse of the whole district which depends entirely upon the mines. The Union at Nanaimo is a strong one, and it is believed it will strenuously oppose a reduction, but rather than allow the mines to be closed might submit to a reduction of 25 cents per ton.

MR. ALF. TREGIDGO, of Grass Valley, has in the city some exceptionally rich rock from the Hudson Bay mine, Massachusetts Hill, Grass Valley. The quartz from the ledge shows free gold abundantly, but from the gouge a great quantity of crystallized gold has been obtained. The gold is in large pieces peculiarly formed. Many persons familiar with mines have been to see this gold and the material from which it came, and all declare it very curious. There is an abundance of fine gold also in the stuff. A number of small shafts have been sunk on the property near by, but the new one sunk by Mr. Tregidgo is the deepest. The old ones were abandoned when water was struck, and the new shaft is the farthest to the north. The ground laid idle for many years until Mr. Tregidgo organized the company to work it.

THE managers of the Sunset Telegraph-Telephone Company in Oakland commenced an important piece of work last week. The trench wherein the cable holding the telephone wires will be laid was dug for a few blocks. The first run of cable will extend from Washington to Oak on Twelfth street. The second cable will be put in on Broadway and will extend from Fifth to Eighteenth street. The third cable will extend from Twelfth to Eighteenth on Clay street. The Broadway cable will also take in all the wires on Washington and Franklin streets. This will leave a clear field for the Western Union company to wrestle with the electric wires which are now causing so much trouble. There are now so many electric roads in operation in this city that it is very unsafe to have overhead telephone or telegraph wires.

Mines at Elk City, Idaho.

ELK CITY, March 16.

TO THE EDITOR:—Everything indicates a mining boom in Elk City district which will equal those of pioneer days. The rich bodies of auriferous gravel that have been lying dormant all these years are now attracting men of capital and energy. Never before was there such eagerness to secure placer mining ground by men of means. On every side new mines have been taken up and prospected.

The appropriation by the legislature of money sufficient to build the wagon road from Grangeville to Elk City, together with the low price of silver, is bound to bring mining men this way. Heretofore the only means of transportation was the patient Cayuse, which made freight very high—even the commonest kind was two cents per pound from Grangeville to the mines, while heavy machinery was out of the question altogether. As an instance of freight rates over the trail, one piece of machinery for the big steam dredge on Red river cost the company over 40 cents per pound, although it weighed only a little over 500 pounds. Certainly this State of affairs was bound to keep mining men from investing in refractory, low-grade gold mines. Now, with a wagon road, things will be different. The very heaviest pieces of machinery can be hauled in here for less money than the commonest kind of freight was packed in for over the trail.

This is the reason why large capitalists are attracted to this camp in greater numbers than ever before, and every mail brings letters of inquiry from some of the most conservative and reliable mining men in the country asking for information about this wonderful camp, the fame of which has spread to all parts of the country.

Now that the transportation problem is practically solved, the people are happy, and with energy born of hope have started to develop their claims. Where only assessment work was done before everybody is preparing to go to work in earnest, and tunnels are being run and shafts sunk on almost every claim. Men who had left the camp to spend the winter with their friends are returning every day, so that within a month every claim in the camp will be worked at least by the owners.

Those who are financially able to put up mills to work their mines are actively discussing the best modes for treating these refractory ores, so that the air is full of stamp mills, Huntington mills, Crawford mills, concentrators and cyanide of potassium; and, by the way, in every case where ore was sent to Denver for treatment by the cyanide process the returns show a saving of upwards of 90 per cent.

Even with the small amount of development work done in the camp there are thousands of tons of ore in sight, most of which can be quarried out and rolled into the mills, so that the cost of mining the rock would be almost nothing, and the hills are so steep that most of the ore could be conveyed from the mines right into the mills by gravity. The country is well watered and nearly all the veins are cut by streams large enough to furnish power for almost any sized mill. The mountains are covered with a thick growth of timber, principally red fir, yellow pine, white fir and tamarack, suitable for both mining and saw timber. The ore of the district is sulphuret of iron and carries from \$8 to several hundred dollars per ton in gold, with about \$2 in silver. From assayers who have been testing this ore I learn that there is just a trace of copper, but no zinc or antimony, and sometimes they find just a little lead in the gold-bearing rock. There is some silver ore in the camp but it is confined to a few claims.

A custom mill would be a great boon to individual claim owners and all poor men who have good claims but are financially unable to put up reduction works of their own. Besides, a plant that would save a good percentage of the gold that is in this ore would pay its promoters an immense interest on the investment; in fact it would more than pay for itself in one year.

M. L. MURRAY.

The California Building.

We present herewith an engraving from a recent photograph showing the California building at Chicago as it approaches completion. A California building, surrounded by snow, will strike the dwellers in the greater part of the State as something of an anomaly: only in Chicago and on

the Sierra Nevada is California property thus envionored. The view of the building will give a better conception of its size and impressiveness than sketches previously presented. It certainly promises to give the Californian visitor to Chicago a patriotic thrill on approaching it. We must acknowledge, however, that we are a little disappointed at the prominent intrusion of the Greek style upon the nearer end of the building. What harmony there can be in this commingling of unrelated styles we cannot see. Perhaps some comfort can be derived from considering it prophetic and indicating that California is to engraft Greek culture and refinement upon *padre* piety and devotion. If so, perhaps the idea is good enough to go to the World's Fair.

The New Road Law.

The late legislature amended the old road law by passage of a new. Its full text is as follows:

SECTION 1. Section twenty-six hundred and thirty-three of the Political Code is hereby amended to read as follows:

2633. Any owner or occupant of land adjoining a highway not less than three yards wide, may plant trees in and along said highway on the side contiguous to his land. They must be set in regular rows, at a distance of at least twenty feet from each other, and not more than six feet from the boundary of the highway. Whoever wilfully injures any of them is liable to the owner or to the occupant for the damage which is thereby sustained; *provided*, if, in

4. Contract, agree for, purchase, or otherwise acquire the right of way over private property, for the use of public highways, and for that purpose institute, or require the District Attorney to institute proceedings under title seven, part three, of the Code of Civil Procedure, and to pay therefor from the District Road Fund of the particular district.

5. Levy a property tax for road purposes.

6. In their discretion, cause to be erected and maintained on the highways they may designate, mile-stones, or posts, or guide posts properly inscribed.

7. Cause the road tax collected each year to be apportioned to the several road districts entitled thereto, and kept by the Treasurer in separate funds.

8. Audit all claims on the funds of the respective road districts, when required to pay for work or improvements thereon.

9. In their discretion, they may provide for the establishment of gates upon public highways in certain cases to avoid the necessity of building road fences, and prescribe rules and regulations for closing the same, and penalties for violating said rules; *provided*, that the expense for the erection and maintenance of such gates shall, in all cases, be borne by the party or parties for whose immediate benefit the same shall be ordered.

10. For the purpose of watering roads in any part of the county, the supervisors may erect and maintain water works, and for such purpose may purchase or lease real or personal property. The cost of such water works and the watering of said roads may be charged to the General County Fund, the General Road Fund and the District Fund of the district or districts benefited.

11. In their discretion, they may advertise for bids to grade, turnpike, gravel, or sprinkle any road or roads in any road district, which contract shall be let to the lowest responsible bidder; *provided*, the Board may reject any or all bids, whenever it shall appear to them that the same are too high. The advertisement of such bids shall specify the road or roads upon which such work is to be done, the kind, character, and extent of the same, so as to plainly indicate to bidders the work to be bid for; and shall, when in their judgment the same is necessary, cause the County Surveyor to survey and furnish a profile of the proposed work, showing cuts, fills, and grades as fully as practicable, which profile shall be open to inspection at the office of the Board of Super-

visors. When such work is completed, the same shall be inspected by the Board of Supervisors, or by a committee of the board appointed by the chairman to inspect and report upon the same. And no payment shall be paid for such work until the same has been inspected and accepted by the board or such committee; *provided*, the Board may, in their discretion, advance not to exceed thirty per cent of the amount of such contract, after the work is at least half completed. Such advertisement for bids shall be in such newspaper as the Board may designate, and be published for the period of at least two weeks, and notice of such letting shall also be posted by the Road Commissioner in three conspicuous places in the district where such work is to be done, for at least ten days before the day set for opening said bids and awarding contracts. Bids shall be inclosed in a sealed envelope, directed to the Clerk of the Board of Supervisors, and shall be endorsed across the face of the envelope, "Bids for road work, ——— District," giving the name of proper district.

Section two thousand six hundred and forty-six of said Act is hereby repealed.

SEC. 4. Section twenty-six hundred and forty-five of said Act is hereby amended to read as follows:

2645. Road Commissioners, under the direction and supervision and pursuant to orders of the Board of Supervisors must:

1. Take charge of the highways within their respective districts and shall employ all men, teams, watering carts, and all help necessary to do the work in their respective districts; *provided*, that no Road Commissioners shall be interested, directly or indirectly, in any contract or work to be done in the road district under his charge and control.

2. Keep them clear from obstructions, and in good repair, and destroy, or cause to be destroyed, at least once a year, all thistles, Mexican cockle-burs, of any kind, and all noxious weeds growing or being on any portion of the public highways or public roads in their respective districts.

3. Cause banks to be graded, bridges and causeways to

THE CALIFORNIA BUILDING AT THE CHICAGO WORLD'S FAIR.

the judgment of the Board of Supervisors, the whole width of such road is needed for use of highway purposes the whole thereof may be used.

SEC. 2. Section twenty-six hundred and forty-one of said Act is hereby amended to read as follows:

2641. The Board of Supervisors of the several counties shall divide their respective counties into suitable road districts, and may change the boundaries thereof, and each Supervisor shall be *ex-officio* Road Commissioner in his supervisor district, and shall see that all orders of the Board of Supervisors pertaining to the roads in his district are properly executed; *provided*, when in any county the members of the Board of Supervisors thereof are not elected by districts, it shall be the duty of such Board, by proper order, to be entered in its records, to divide such county into supervisor districts to correspond with the number of members of such Board, and to assign to each member thereof one of said districts, of which he shall be such Road Commissioner; when not otherwise provided by law he shall receive for his services as such Road Commissioner twenty cents per mile, one way, for all distances actually traveled by him in the performance of his duties; *provided*, that he shall not, in any one year, receive more than three hundred dollars.

SEC. 3. Section twenty-six hundred and forty-three of said Act is hereby amended to read as follows:

2643. The Board of Supervisors of the several counties of the State shall have general supervision over the roads within their respective counties. They must, by proper order—

1. Cause to be surveyed, viewed, laid out, recorded, opened, and worked such highways as are necessary to public convenience as in this chapter provided.

2. Cause to be recorded as highways such roads as have become such by usage, dedication, or abandonment to the public. Also all such streets and roads as have been or may be declared such under section seventeen hundred and sixty-four of the Code of Civil Procedure.

3. Abolish or abandon such as are not necessary.

be made when necessary, keep the same in good repair, and renew them when destroyed.

SEC. 5. All Acts and parts of Acts in conflict with this Act are hereby repealed.

SEC. 6. This Act shall take effect and be in force from and after its passage.

Classification of Mineral Waters.

Mineral waters have been used from time immemorial as medicinal agents, but always with exceedingly variable effects even with the use of the same waters and for the same diseases. This irregularity of action is to be accounted for by reason of the instability of some of the most important qualities; for, although water is the most universal solvent in nature, its operations in this respect are on very different scales, chiefly depending upon its temperature and the amount and kind of gases and acids it holds in solution.

The solvent power of water, when heated under pressure to a temperature above 212° Fahrenheit, is greatly increased, inasmuch that the late Dr. Turner found that pieces of glass enclosed in the upper part of a high-pressure steam boiler, worked at 300° F., at the expiration of four months were found completely corroded by the action of the water; that which remained was a mere white mass of silica, destitute of alkali, while stalactites of silicious matter, above an inch in length, depended from the little wire cage which enclosed the glass. This experiment aptly illustrates the conditions and the changes produced by the action of water confined at a high temperature in contact with various mineral substances in the interior of the earth. Pressure also exercises a marked influence on the absorptive power (the solution) of water, of gases independent of temperature; and this condition, probably more than any other, is made use of to the detriment, or at least to the change of quality, of mineral waters in common use.

Gases are soluble in water in very unequal quantities of the different gases at different temperatures. For example, at 32° F., one volume of water dissolves somewhat less than one-twentieth of its volume of hydrogen and exactly one-fiftieth of its volume of nitrogen, while it dissolves five hundred and six and one thousand and fifty volumes, respectively, of hydrochloric acid and ammonia. And again, at the same temperature, 32°, it dissolves 1.8 times its volume of carbonic acid, while at 62° it dissolves only half as much. Ordinarily, the greater the pressure the greater the quantity of gas absorbed. Gases moderately soluble in water follow a chemical law (of Henry and Dalton) according to which the quantity of gas dissolved is proportional to the pressure. But gases which are exceedingly soluble in water, ammonia and hydrochloric acid, for example, do not conform to this law; these gases are soluble up to eight hundred or one thousand times their volume.

Salts generally are soluble proportional with the increase of temperature, but they deposit on the cooling of the water. There are some important exceptions, however, the most remarkable of which is that of common salt, which is about equally soluble at all temperatures. And a few there are—hydroxide and certain organic salts of calcium, for example—more freely soluble in cold water than in hot. And there are some salts so extremely soluble in water that they extract the vapor from the atmosphere and dissolve themselves in it. Such are the conditions common to mineral waters as they obtain everywhere.

Everybody knows that the most stable qualities of mineral waters are the easily ascertainable mineral substances taken up and held in solution from the geological strata from which the water springs, or through which it has passed. But if the no less important volatile qualities—the temperature, by means of which the mineral substances are held in solution, and the kind and quantity of gases contained in it as it springs to the surface—are ignored in the too great haste to put it upon the market, it is a very imperfect imitation. Indeed, it is upon the continued presence, approximately at least, of the same temperature, kind and amount of gases, by which the water is empowered to hold the mineral substances natural to it in solution, no less than upon the mineral substances themselves, that its true therapeutical properties depend; hence the difference in the effects of mineral waters partaken at their source, and those designed to represent them, served in bottles.

Moreover, with reference to bottled waters particularly, in the effort of bottlers to replace the gases that begin to escape from the water at the springs the moment it is relieved from pressure—which it is difficult, if not wholly impracticable, to duly estimate—it is frequently surcharged with carbonic acid to such a degree as to effect a change in its properties, inasmuch that alkaline waters at the springs are not infrequently acidulated waters in the hands of physicians and their patients, liable to wholly different effects from the remedy intended. Besides, there are many people, and some of them physicians, who are so little acquainted with the properties of mineral waters that they estimate their freshness and excellence according to the amount of carbonic acid they appear to contain on drawing the cork.

Clearly such a classification of the mineral waters of the United States as will indicate all their chemical constituents and therapeutical properties is impracticable.

Their therapeutical properties are indicated by what they hold in solution and their temperature. Hence they are acid, alkaline, alterative, antacid, astringent, caloric, diaphoretic, diuretic, lithontriptic, purgative, refrigerant, stimulant, tonic, or a mere luxury, according to what they hold in solution and their temperature; and it is the physician's sphere to appropriate them.

The following classification is believed to be sufficiently comprehensive to include the properties of all the mineral waters in the United States hitherto described.

1. ACIDULOUS WATERS.—These owe their virtues chiefly to the presence of free carbonic acid gas, commonly due to the decomposition of iron pyrites in the crystalline rocks, by which sulphuric acid is formed. The contact of

sulphuric acid with the carbonates liberates the carbonic acid gas, and this, being absorbed by the water, communicates its acid properties. The amount of carbonic acid must, of course, be in excess of that which is required for combination (forming carbonates of bicarbonates) with any chemical substances contained in the water, and the strength of the acidulous water is to be determined by the proportion of such really free carbonic acid only. Such waters greatly vary in the amount of their solid constituents, and thus different waters of this class also possess the properties of some one or more of the other groups, into which they may also be classified with equal propriety.

2. ALKALINE WATERS.—These are commonly distinguished by containing carbonate of sodium and free carbonic acid, and, in rare instances, the biphosphate of sodium, with or without the presence of chloride of sodium and sulphate of sodium also. Hence, they may be alkaline sodic or acidulous alkaline, containing bicarbonate of sodium; alkaline muriatic, containing the chloride of sodium; or alkaline saline, containing sulphate of sodium—all variable. In some cases the products of the decomposition of the silicates are chiefly sulphates and carbonates of the alkalis, and, if the latter are abundant, they will, on account of their extreme solubility, render the water decidedly alkaline. And these are commonly highly charged with free carbonic acid, as, for example, Vichy water. In the purest alkaline waters there are scarcely any solid ingredients except the carbonates of the alkalis. Alkaline waters are also not infrequently met with both as thermal and cold springs.

3. CALCAREOUS OR EARTHY WATERS.—These waters are characterized by the presence of the sulphates and carbonates of lime and other alkaline earths, frequently held in solution by an excess of carbonic acid. Sulphate of lime is the particular salt upon which the properties of these waters commonly depend, but most of the springs containing it also contain the carbonate of lime. These are the waters generally designated by the name "hard waters." The phosphate of lime is also sometimes found in calcareous waters, and, in the absence of an excess of the sulphates and carbonates, it is a valuable constituent.

4. CHALYBEATE WATERS.—These waters are characterized by the presence of iron. The form in which it is found is, with rare exceptions, the bicarbonate of the protoxide, held in solution by the excess of carbonic acid with which the water is charged. Chalybeate waters are for the most part cold, although they are sometimes thermal. They are frequently strongly acidulous, from the large excess of carbonic acid which they hold. Upon prolonged exposure to the air the iron salt gradually undergoes decomposition and separates from the water as hydrated oxide of iron, the free carbonic acid escaping. The sulphate of oxide of iron is sometimes present in these waters, but it is in exceedingly small quantity; and "some of them contain a not insignificant amount of bicarbonate of sodium, and are therefore 'iron acidulous' springs; others contain Glauber salt (the maximum three-fifths grammes to the litre), and are therefore called 'muriatic acidulous iron springs.' Finally, some contain a certain amount of carbonate or sulphate of lime (maximum of two grammes to the litre): these are called 'earthy acidulous iron waters.'"—Ziemssen.

5. CHEMICALLY INDIFFERENT WATERS.—This group comprises such waters as do not contain a sufficient amount of any chemical substance as to give a distinctive character, yet they seem to possess properties which give them some medicinal value. As no natural water has ever been found perfectly free from the solution of gases or other substances, extraordinary freedom from such substances suggests that such water may be partaken of in larger quantity with impunity, and that, on account of its greater purity, it possesses proportionately greater absorptive power, indicating its usefulness.

6. SALINE WATERS.—These are, for the most part, solutions of halogen compounds of the alkalis, commonly distinguished by the presence of a large amount of the chloride of sodium, or common salt. But they also comprise solutions of the chlorides of calcium, magnesium, potassium, lithium and aluminum. And some are said to contain small amounts of the iodides and bromides of soda, arsenic, potassium, calcium and magnesium, but in very minute quantities.

7. SULPHURETTED WATERS.—These chiefly depend for their properties upon the presence of sulphuretted hydrogen, and are commonly distinguished by their odor, independent of analysis. The sulphuretted hydrogen in these waters is formed by the oxidation of iron pyrites in contact with water. The sulphides of sodium, calcium, magnesium and potassium are sometimes present in these waters, singly or together, but always in very minute quantities; as, indeed, the sulphuretted hydrogen—the amount held in solution by water or given off from it—varies from a mere trace to forty-two cubic centimeters in the litre. These waters are widely distributed, cold or thermal in various degrees.

8. UNCHARACTERIZED WATERS.—This group includes all mineral waters whose properties are not sufficiently well known by analysis or otherwise to signify their properties. Dr. A. N. Bell in the Sanitarium.

THE Olympic Salt Water Company, which is to bring salt water from out near the Cliff House, into the city, has part of its pipes already laid, and a contract has been let for the rest. The company is preparing to furnish not only salt water, but hot salt water, direct to consumers' bathrooms all over the city. They are completing arrangements by which, at the power-house, they will use the salt water to condense their steam, and the company will use the steam to heat the water. That is, the exhaust steam from the engine will be run through pipes over which the water from the mains is flowing. The company is also going to build three immense baths to be supplied with warm salt water, just like that in the Olympic Club, and will locate them in different parts of the city. One will be near the Palace Hotel, not far from the Edison Electric Light Company's works. The second will be at the corner of Tenth and Howard, and the third one will be

close to the Park, in the vicinity of the point where California street intersects the Western addition. These baths will be large; very large, so that they will not only accommodate a big attendance of bathers, but one will really think he is having a swim. These baths will be fitted up with every possible convenience. This plan of utilizing steam to heat the water will enable them to fill the baths with warm water without additional expense, and placing them as they are, in different parts of the city, everybody will be able to take advantage of them.

The Capital Removal Question.

The proposition to move the State capital from Sacramento to San Jose meets with decided opposition in the southern counties where it was supposed it would be popular. In that district there is an almost universal sentiment favorable to independent Statehood and the whole influence of this feeling is against the San Jose proposition on the ground that it would postpone if not defeat the project of State partition. Of 104 local papers (representing all parts of the State) which we notice as having rendered judgment on the question of removal, 56 are for Sacramento and 48 for San Jose. The list for Sacramento is as follows: *Anaheim Gazette*, *San Benito Advance*, *Placer Argus*, *Benicia New Era*, *Ontario Record*, *Santa Ana Blade*, *Redlands Citograph*, *Woodland Democrat*, *Stockton Independent*, *Oroville Mercury*, *Red Bluff Sentinel*, *San Diego Sun*, *Fresno Republican*, *Colusa Sun*, *Rodeo Daily News*, *Red Bluff People's Cause*, *Fresno Expositor*, *Visalia Delta*, *Marysville Appeal*, *Kern County Gazette*, *Sonoma Democrat*, *Yreka Journal*, *San Diego Union*, *Eureka Standard*, *Chico Chronicle-Record*, *Woodland Mail*, *Ukiah Dispatch-Democrat*, *Santa Barbara Independent*, *Downville Mountain Messenger*, *Amador Ledger*, *Santa Cruz Blade*, *Visalia Times*, *Sutter County Farmer*, *Boodie Miner*, *Marysville Democrat*, *Los Angeles Herald*, *Vallejo Chronicle*, *Redding Free Press*, *Sacramento Record-Union*, *Sacramento Bee*, *Sacramento News*, *Calaveras Chronicle*, *Sonoma Index-Tribune*, *Winters Express*, *Truckee Republican*, *Williams Farmer*, *Riverside Press*, *Placer Herald*, *Petaluma Argus*, *Weeky Orange Post*, *Paso Robles Independent*, *Los Angeles Express*, *Willits News*, *Monrovia Messenger*, *Sacramento Wonder*, *Ione Valley Echo*—in all 56.

The list for San Jose is as follows: *Gilroy Gazette*, *Watsonville Rustler*, *Haywards Journal*, *Downey Champion*, *Antioch Ledger*, *Santa Cruz Sentinel*, *Oakland Times*, *San Jose Times*, *San Jose Record*, *Alameda Argus*, *Petaluma Courier*, *Napa Register*, *Hollister Free Lance*, *Grass Valley Tidings*, *Inyo Independent*, *Stockton Mail*, *Ventura Democrat*, *Salinas Index*, *San Bernardino Times-Index*, *Modesto Herald*, *Los Angeles Times*, *San Luis Obispo Tribune*, *San Jose Mercury*, *Santa Rosa Republican*, *Redwood City Democrat*, *Lakeport News*, *Marin Journal*, *San Mateo Leader*, *Redwood City Times*, *Santa Monica Graphic*, *Gilroy Advocate*, *Ventura Free Press*, *Madera Mercury*, *Mountain View Register*, *Watsonville Transcript*, *Arroyo Grande Herald*, *Pleasanton Times*, *Paso Robles Moon*, *Banning Herald*, *Arcata Union*, *Lompoc Record*, *Sierra Valley Leader*, *Kern County Californian*, *Santa Clara Journal*, *Eureka Times*, *West Coast Alliance*, *Vacaville Reporter*, *San Bernardino Courier*, *Santa Cruz Record*—in all 48. It is a notable fact that not one of the great San Francisco dailies has taken sides either way. *The Chronicle*, the *Bulletin*, the *Post* and the *Report* have said nothing at all editorially. The *Examiner*, while not espousing either side of the issue, has simply remarked that it was a great question, and that it should be determined on more important considerations than mere personal resentment on the part of legislative representatives.

ARTICLES have been signed which necessitate the immediate construction of the Donner & Lake Tahoe Railroad. Contracts for grading, getting out ties and building the road will be let in a few days, and from ten to fifteen thousand dollars will be paid out to Truckee workmen in time for their Fourth of July celebration. And these figures denote only the beginning! The iron, equipments, rolling-stock and, in fact, everything but the ties, grading and laying the track, are now ready for the first ten miles of road, and for that distance the road must be completed by the 15th day of July. Only one of the corporations builds the road, but the other furnishes the work which will make it one of the best paying little railroads in the State. Over one hundred million feet of saw-logs are to be hauled over the line in the next ten years. All these logs now stand in the vast forests owned by the Truckee Lumber Co. between Truckee and Lake Tahoe. When they have been cut and hauled and dumped in the upper millpond of the Truckee Lumber Co., they will have to be sawed and manufactured into lumber, boxes, furniture, doors, sashes, blinds and other merchantable articles. Some idea of the magnitude of the operations contemplated and of their importance to Truckee may be gleaned from these statements and the fact that the mammoth factory of the Truckee Lumber Co. will run day and night, winter and summer.

THE most successful artesian well ever sunk on the Colorado desert has been made by the Southern Pacific people on the line of their road at Walters station, which is 195 feet below the level of the sea and 106 miles west of Yuma, the well is 483 feet deep and it has a flow of 23,000 gallons every twenty-four hours. It is thought the water enters the well at the 400-foot depth, and the stream has a force sufficient to raise the water height of twenty-four feet into a large tank by the side of the road. It is fresh cool water, almost clear, and comes, it is thought, from the distant mountains, underneath a heavy stratum of clay that is found under that salty depressed region of the desert. There has been some little water found at the station heretofore, but only a very limited quantity, and until the discovery of this "banner well," as Mr. Curtis calls it, the prospects of a water supply between Indio and Yuma were very poor.

NEW AND CHOICE PRACTICAL BOOKS JUST READY.

BRANNT.—The Practical Scourer and Garment Dyer. Comprising Dry or Chemical Cleaning; the Art of Removing Stains; Fine Washing, Bleaching and Dyeing of Straw Hats, Gloves and Feathers of all kinds; Dyeing of Wools of all Colors, including Mixed Goods, by One Dip, and the Manufacture of Soaps and Fluids for Cleaning Purposes. Edited by William T. Brann, Editor of "The Techno-Chemical Receipt Book." Illustrated. 200 pages, 12mo. Price.....\$2.00

LIEBK.—The Assayer's Guide; or, Practical Directions to Assayers, Miners and Smelters, for the Tests and Assays, by Heat and by Wet Processes, of the Ores of all the Principal Metals, of Gold and Silver Coins and Alloys, and of Coal, etc. By Oscar M. Lieber. A new, revised and enlarged edition. Illustrated. 283 pages, 12mo. Price.....\$1.50

DUNCAN.—The Practical Surveyor's Guide. Containing the necessary information to make any person of common capacity a Finished Land Surveyor, without the Aid of a teacher. By Andrew Duncan, C.E. New, revised and enlarged edition. Illustrated by 72 engravings. 211 pages, 12mo. Price.....\$1.50

RECENTLY PUBLISHED.

DEITE. A Practical Treatise on the Manufacture of Perfumery Comprising directions for Making all kinds of Perfumes, Sachet Powders, Fumigating Materials, Dentifrices, Cosmetics, etc., etc; with a full account of the Volatile Oils, Balsams, Resins, and other Natural and Artificial Perfume Substances, including the Manufacture of Fruit Ethers, and Tests of their Purity. By Dr. C. Deite, assisted by L. Borchert, F. Elchbaum, E. Kugler, H. Toepfner, and other Experts. From the German by William T. Brann, editor of "The Techno-Chemical Receipt Book." 28 engravings, 12mo, 358 pages. Price.....\$3.00

LANGBEIN.—A Complete Treatise on the Electro-Deposition of Metals. Comprising Electro-Plating and Galvanoplastic Operations, the Deposition of Metals by the Contact and Immersion Processes, the Coloring of Metals, the Methods of Grinding and Polishing, as well as Description of the Electro Elements, Dynamo-Electric Machines, Thermopiles, and of the Materials and Processes used in every Department of the Art. From the German of Dr. George Langbein. By William T. Brann. 125 engravings. 8vo, 404 pages. Price.....\$4.00

LARKIN.—The Practical Brass and Iron Founder's Guide. A Treatise on Brass Founding, Molding, the Metals and their Alloys, etc. By James Larkin. A new revised and greatly enlarged edition. Illustrated. 12mo, 400 pages. Price.....\$2.50

LEHNER.—The Manufacture of Ink. Comprising the Raw Materials, and the Preparation of Writing, Copying and Hektograph Inks, Safety Inks, Ink Extracts and Powders, Colored Inks, Solid Inks, Lithographic Inks and Crayons, Printing Ink, Ink or Aniline Pencils, Marking Inks, Ink Specialties, Sympathetic Inks, Stencil Inks, Wash Blue, etc., etc. From the German of Sigmund Lehner, Chemist and Manufacturer, by William T. Brann. 12mo, 230 pages. Price.....\$2.00

OSBORN.—The Prospector's Field Book and Guide in the Search for and the Easy Determination of Ores and other Useful Minerals. By Prof. H. S. Osborn, LL.D., author of "A Practical Manual of Minerals, Mines and Mining." 44 engravings. 12mo, 175 pages. Price.....\$1.50

WAHNSCHAFTE.—A Guide to the Scientific Examination of Soils. Comprising Select Methods of Mechanical and Chemical Analysis and Physical Investigation. From the German of Dr. Felix Wahnschaffe. With additions by William T. Brann. 25 engravings. 12mo, 177 pages. Price.....\$1.50

BRANNT-WAHL.—The Techno-Chemical Receipt Book. Containing several thousand Receipts, covering the Latest, most Important, and most Useful Discoveries in Chemical Technology, and their Practical Application in the Arts and Industries. Edited by William T. Brann and W. H. Wahl, Ph.D. 78 engravings. 405 pages, 12mo. Price.....\$2.00

BRANNT.—The Metal Worker's Handy Book of Receipts and Processes. 63 engravings. 536 pages. 12mo. Price.....\$2.50

BLINN.—A Practical Workshop Companion for Tin, Sheet-Iron and Copper-Plate Workers. Containing Rules for describing various kinds of Patterns used by Tin, Sheet-Iron and Copper-Plate Workers; Practical Geometry; Mensuration of Surfaces and Solids; Tables of the Weights and Strengths of Metals and other Materials; Tables of Areas and Circumferences of Circles; Composition of Metallic Alloys and Solders, with numerous valuable Receipts and Manipulations for everyday use in the workshop. By Leroy J. Blinn. A new, revised, and enlarged edition, printed from new type, and with 170 newly engraved illustrations. In one volume, 12mo, 296 pages. Price.....\$2.50

VAN CLEVE-EDWARDS.—The English and American Mechanic. An Every-Day Handbook for the Workshop and the Factory. Containing several thousand Receipts, Rules and Tables, indispensable to the Mechanic, the Artisan and the Manufacturer. By B. Frank Van-Cleve and Emory Edwards, C.E. 85 engravings. 500 pages, 12mo. Price.....\$2.00

EDWARDS.—600 Examination Questions and Answers for Engineers and Firemen (Land and Marine): Who desire to obtain a U. S. Government or State License. By Emory Edwards. Pocket book form, gilt edges. 123 pages. Price.....\$1.50

EDWARDS.—The American Marine Engineer. Theoretical and Practical, with Examples of the Latest and Most Approved Marine Practice. For the Use of Marine Engineers and Students. By Emory Edwards. Illustrated by 85 engravings. 440 pages. Price.....\$2.50

JOSHUA HENDY MACHINE WORKS.

NO. 51 FREMONT STREET, SAN FRANCISCO, CAL.

BUILDERS OF

"Sensible" Horse-Power Hoisting Whims.

(DAVIS PATENT.)

PRICES REDUCED.

The "Sensible" Hoist is the cheapest and beyond doubt the best in the market. It is built entirely of iron and steel, mounted on a heavy iron base plate, and is therefore very durable and not affected by exposure to climatic influences.

The bevel gear on the drum shaft is loose, and, in hoisting, drives the drum through a friction clutch. This avoids the frequent accidents occurring with other Whims, occasioned by the breaking of the gear teeth when throwing them out of gear. In lowering, the drum is pressed by a powerful screw lever against brake wheels at the opposite end. Perfect means of adjustment are provided for the friction clutch and brake blocks.

As the drum is entirely independent from the driving gears the operations of hoisting, dumping bucket and lowering can be performed with the horse in constant motion, a feature not possessed by any other horse hoist in the market, and one that greatly increases the capacity of the machine by avoiding the loss of time due to stopping and starting the horse.

It is very light and compact and very easily taken to pieces for transportation by mules. The cost of erection is very small, two men in half a day being able to put it in place ready for work.

Weight of hoist, 1200 lbs. Total shipping weight, including sweep, levers and sheaves, 1400 lbs.

Circulars giving Capacities and Prices furnished on application.

THE BLASDEL CONCENTRATING BELT COMPANY.

We are now having our new Improved Concentrating Belt manufactured in San Francisco. We keep always on hand Belts suitable for the Triumph and Frue machines, but can make any length or width desired. The advantages of these belts over any others will be readily seen by practical millmen.

First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight ribbed surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. These slight ribs also save very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth. We can safely say that it is a better concentrator belt than has ever been manufactured. It will last much longer and will handle more pulp. We also manufacture smooth belts with same flanges when desired.

H. G. BLASDEL, Jr., Manager, 419 California St., San Francisco.

THE BEST NEWSPAPER published in the district is
THE TIDINGS.

Daily and Weekly edition. Gives all the Mining News. Dealers in Mining Machinery and Mining Supplies will find THE TIDINGS the best medium for directly reaching the owners or managers of mines. Investors in mines will find it to their advantage to subscribe. Many mines are in successful operation, and new enterprises are being instituted and many others are in contemplation.

DAILY, \$4.00 a year; WEEKLY, \$2.50, in advance.
H. S. SPAULDING, Publisher.

T. C. HOCKING, Editor.

RUPTURE,

PILES and all Rectal Diseases POSITIVELY CURED, in from 30 to 60 days, WITHOUT OPERATION OR DETENTION FROM BUSINESS. Also ALL NERVOUS, SKIN, BLOOD, PRIVATE AND CHRONIC DISEASES OF BOTH SEXES, STRUCTURE AND URINARY TROUBLES CURED. No charge unless cure is effected. Consultation free. Call or address for pamphlet, DR. PORTERFIELD & LOSEY, 888 Market Street, San Francisco, Cal.

Mechanical Progress.

Quicksand, the Bane of Builders.

Mr. Roht. L. Harris, of the Am. Soc. C. E., in the course of a lecture before the Engineering Section of the School of Mines, Columbia College, remarked:

Quicksand is a bane of engineers and bunders. It has sunk millions of capital, and has caused the abandonment of extensive enterprises. I had known from observation that fine quicksand is widely scattered, but had no idea until recently that it is so extensively distributed. During the past six months I have received complaints of it from Puget Sound to Maine, and between the Gulf of Mexico and Canada, from the interior as well as near the great bodies of water. As cities build deeper, and municipal improvements go deeper still, we learn more of what is beneath than when our works were nearer the surface. The process of which I speak is proposed for upward of 20 engineering superstructures located in 15 different States.

Upon some important work in Providence, R. I., an intercepting sewer, 6 to 8 feet in diameter, a halt had been called on account of the quicksand encountered. The contractors for the worst sections claimed that it was ruinous for them to proceed and had petitioned the City Council to release them from their contracts and cancel their bonds, which was subsequently done. Nearly all the work and trials had been made by the usual methods of sheeting, excavating and pumping out, reducing the water level. These resulted in the sinking of considerable tracts of the original surface 4 to 5 feet, carrying down forest trees, building materials, etc. Experience prompted me to consider the reverse of these processes, that of pumping in material which should solidify the troublesome quicksand in place, while in its normal condition and before injurious sub-currents should be established, in fact to make it its own protector. The problem was separated into three divisions, which, as they represented unknown quantities to be obtained, we will designate by the algebraic characters, x , y , z . These were then, x , to find a cementing substance, fluid or otherwise, that should unite with and solidify this extremely fine and light, yet compact and hard quicksand; y , to form channels and chambers at any depth under ground, and of desired form, without extensive disturbance of the surface or the neighboring materials; z , to fill such chamber and permeate the interstices of the adjacent materials with the cementing substance x . The divisions y and z comprised a pretty riddle. It was to put a fluid, say, 40 feet into the earth and below water level in such a way that it shall mix with the material there for a defined area of, say, 12 x 30 feet, and solidify the same, so that if an excavation is made a month or a century hence, that floor will be found as you now determine; or, if you prefer, let it be a Cardiff giant or any remains of prehistoric cities.

Could a cementing fluid be forced through and into fine sand at a depth below the surface? Would it remain in a cavity already filled with incompressible water? Would it harden sufficiently within reasonable time under the buried conditions and in predetermined shape? Could the pipes be used and removed without being clogged or made useless? A trial was made on the work during the second week in March and in freezing weather, as bad as any experienced during the winter. The answers to the queries suggested were satisfactory. The results, despite the adverse circumstances, were successful, and fully demonstrated the method, and that it would be under complete control. The engineers and contractors of the work promptly and cordially expressed their satisfaction with the trial and their confidence in the new method.

The result is that x , y and z are determined both theoretically and practically. The ultimate results should be far reaching and of great benefit. The method is applicable not only to quicksands but to other sands and the finer earthy materials. The applications are innumerable, enabling engineers and builders to make constructions in many of the fine, loose or soft materials, largely of the substances themselves, at any depth below the surface or of the adjoining material, as for example, shafts, tunnels bridge foundation or canal repairs, water works, sewers, harbors, shore protections, jetties, buildings, etc., and, perhaps, there may be found herein the solution of a difficult problem in rapid transit for cities.

MECHANICAL STRUCTURE OF A TREE. When a man is disposed to plume himself upon his mechanical ability, let him go out and look at a tree, and then he will conclude that he is not so much of a mechanic in any

event. His clumsy pumps with their palpable valves and his rickety bridges with their members stuck together with rivets are put to shame by the wonderful structure of a tree, which draws water ten times farther than man can draw it, and supports loads by the single attachment of a branch to a trunk, which no bridge ever made by man could carry one instant upon the same section. More than this, the tree takes in a gas poisonous to human life—carbonic acid—and charges it into the essence of all life—oxygen—but it is chiefly in its mechanical structure that it makes the proudest engineer humble when he looks at it.

How to Rig the Indicator.

In using the steam engine indicator, select some reducing motion with as few joints and as little complication of parts as possible. In a number of works on indicator practice which I have examined, the manipulation of the instrument and the working of the engine is placed before the reader with much minuteness. The reducing of the stroke of the piston to that of the desired length seems to me to be somewhat slighted, or passed over with less attention than this subject warrants. A chance for error and much annoyance is experienced by unskillful or careless handling of a reducing rig.

The principal use of the indicator for the working engineer is to guide him in the adjustment or setting of his valve gear. The instrument should be applied at least once a week, and some rig for reducing the motion of the piston should be selected which will admit of easy attachment without stopping the engine. In visiting engine-rooms in my locality I have seen several different rigs which are approximately correct, and of sufficient merit to warrant a reproduction of some sketches descriptive of them.

A neat arrangement consists of a light brass wheel which has two diameters, the larger diameter being of such dimensions that the circumference will be one-half the stroke of the engine, and the smaller having a circumference one-half the length of the diagram. A cord wound two or three times around the large wheel is attached to the cross-head, and a cord from the wheel of smaller diameter leads to the harrel of the indicator when in operation, or is hooked to an idler cord which passes over a leading pulley to a weight while the indicator is at rest. A clock-spring attached to the side of the wheel causes the return motion after the cord has been drawn out by the moving cross-head. This rig is a permanent attachment to the front head of an engine I have in mind, is in regular use, and is giving satisfaction. I fitted up one of these wheels at a total cost of three dollars.

If there are several feet of space between the walls of your engine and the engine-bed a rig may be fitted quickly and without cost. Procure a stick of half-inch hard wood an inch and a half wide, and from two to three times the length of the stroke of the engine. To one end of the stick fix a slotted piece of iron, which is intended to be driven by a stud on the cross-head. On the other end of the stick attach a piece of iron with a hole drilled in it for a half-inch pin to work in. Make the pin fast in an angle-plate attached to the wall. The cord from the indicator barrel must lead at a right angle to the line of cylinder, changing its direction by leading around a small pulley and to a peg placed at a proper distance on the wall end of the stick.—M. Cable in Power.

Where Anchors Are Made.

"The little town of Camden, Me., ought to have its name changed to Hope," said a dealer in ship supplies and stores, "for it turns out more of the emblems of hope than all the other places in this country combined. All of the stately ships that come out of the Maine shipyards look to that little village on the Penobscot for their anchors. Scores of sturdy smiths swing their hammers day after day all the year long in the black, smoky, long, low Camden shops, where only anchors are forged.

"Sometimes the triphammers are going all night about the forges, and the blazing of the fires and the ring of the hammers are seen and heard for miles away. Thousands of tons of old iron are purchased by these queer establishments every year, for anchors are forged largely from cast-off iron. The material is cut into small pieces by great shears that clip through the iron as easily as a cheese-knife slices a cheese. The pieces are bound into bundles by strong wires, and are then fused in the forges. Then they are pounded and welded into the various parts of the anchor, some workmen fashioning the rings, others shaping the flukes, others hammering out the palms

and others forging the shanks. Then the completers take the different parts and fuse and weld them into the finished anchor. Anchors of all sizes and weights are turned out from the noisy shops of Camden, the graceful little pleasure-boat anchor, weighing but a few pounds, as well as the great 50,000 and 75,000-pound anchors of the biggest ships.

"There are many interesting relics at Camden in the line of rusty and broken anchors that did duty in their day on famous merchant vessels, historic warships and sturdy whalers. What is left of the anchor of the United States frigate Cumberland is among these relics."—New York Sun.

Scientific Progress.

Work at High Altitudes.

Some practical facts are furnished by the experience of the workmen engaged in the construction of the new Central railway over the mountains in Peru. The line starts at Lima, in altitude 12 degrees. The summit tunnel of this line at Galeria is at the height of 15,645 feet, or a little under the height of Mont Blanc, but it must be remembered that the climatic conditions are very different and more unfavorable in Peru than in Europe. Mr. E. Lane, the engineer in chief, finds that the workmen, up to an altitude of 800 to 10,000 feet, do about the same relative quantity of work as at the sea level, provided they have been inured to the height or brought up in the country. At 12,000 feet the amount of work deteriorates, and at 14,000 to 16,000 feet a full third has to be deducted from the amount that the same men could perform at sea level.

Owing to the absence of malaria the percentage of efficient labor at the greatest elevation is a very high one. Men coming from the coast are not found capable of doing efficient work for about two weeks on an average when taken to high elevations. The capacity gradually increases and reaches its maximum in a few weeks or months, according to the constitution of the individual. The majority of the laborers are "Cholos," or Indians born in the Sierra. They are found incapable of doing efficient work on the coasts or in the warmer altitudes without a long course of acclimatization. If gangs of these "Cholos" have for special purposes been taken suddenly down from the Sierra to work at altitudes of from 2000 to 5000 feet, sickness and fever have resulted from the change.

Mules and horses are found to do about the same efficient work proportionately as human beings up to about 17,000 feet in this district. Mules stand the climate best, but, again, require some weeks for acclimatization, and if urged to undue exertion at great altitudes they are liable to drop dead suddenly. It may be remarked that the region of perpetual snow in the district begins at about 18,000 feet.—Nineteenth Century.

Power of the Air.

The magnitude of the store of aerial energy, upon which mankind may draw so long as the race exists upon this earth, is beyond the reach of imagination to conceive, but not beyond the power of computation of the mathematician. Taking the quantities roughly and in "round numbers," the atmosphere weighs about a ton to every square foot of the earth's surface; 25,000,000 tons per square mile, or 5,000,000,000,000,000 tons on the total of 200,000,000 square miles.

Its energy is that due to the motion of this inconceivable mass, at velocities varying all the way from the gentlest zephyr to the hurricane and the cyclone, rushing over the prairie or along the surface of the sea at more than 100 miles an hour. A cubic mile of air weighs about 10,000,000,000 pounds, and, at the rate of motion of the cyclone, develops 4,000,000,000,000 "foot-tons" of energy, and, if all employed at this rate for the performance of work, useful or destructive, this 8,000,000,000,000 "foot-pounds" would be equivalent to more than 2,000,000,000,000,000-horse power.

If the disturbance reaches the exterior of the atmospheric shell enclosing the earth, it embodies 10,000,000,000,000,000-horse power, or millions of times as much as the highest estimates make the probable whole steam power of the world at the end of the 19th century.

Assuming the moderate velocity of 16.7 miles an hour for the whole atmosphere of the globe, its energy per mile is 1.36 of that just computed, and 5,000,000,000,000,000 tons of atmosphere would represent about 50,000,000,000,000,000 foot-tons of energy and not far from 50,000,000,000,000-horse power, certainly more than a half-million times as much power as have all the engines

in the world combined. Each cubic mile would store 40,000,000,000-horse power, and every square mile, could 110 feet of its superincumbent atmosphere be utilized, would yield about 80,000,000-horse power, which is not far from the aggregate of the existing steam power of the world.—Engineering Magazine.

LOAD TO SQUARE FOOT.—The load which is produced by a dense crowd of persons is generally taken at 80 to 100 pounds per square foot, and is considered to be the greatest uniformly distributed load for which a floor need be proportioned. That this value may be largely exceeded in an actual crowd was pointed out by Prof. W. C. Kernot, of Melbourne University, Australia, in a recent paper before the Victorian Institute of Engineers. In an actual trial, a class of students averaging 153.5 pounds each in weight were crowded in a lobby containing 18.23 square feet, making an average floor load of 134.7 pounds. There was still room to have placed another man, which would have brought up the loading to 143.1 pounds per square foot. Professor Kernot also quoted from Stoney, who placed 58 Irish laborers, averaging 145 pounds each in weight, in an empty ship deck-house measuring 57 square feet floor area. This was a load of 147.4 pounds per square foot. In another test, with 73 laborers crowded into a hut, 9 feet by 8 feet 8 inches, Stoney produced a load of 142 pounds per square foot, and estimated that two or three more men could have been squeezed in. It appears from these experiments that, while the figures ordinarily assumed of 80 to 100 pounds are sufficiently correct for spaces on which there is no cause to induce the collection of great crowds, larger figures, say 140 or 150 pounds per square foot, should be used for railway stations and platforms, entrances and exits to places of public assemblies, or of office buildings, bridge sidewalks, pavements over vaults, and other places where dense crowds are likely to gather.—Engineering News.

ENAMELS.—Of enamels there are two sorts, entirely distinct. The first are the incrustated enamels and the second are the painted enamels. Enameling consists in applying to a metal surface a powder composed of pounded silice, or to put it in the simplest form, of glass colored with metallic oxides and then fixed by fire. Thus it is obvious that the transition was easy from letting colored glass into gold or silver settings to melting the glass into its place so that it adhered at the back. The earliest enamels tell their own story. They are "cloisonne"—that is to say, precisely as jewels were set in a framework of metal, so frameworks of metal were fashioned to contain the glass melted into these cells. This was the construction of "cloisonne" enamel. First of all, a fine band of gold was soldered on to the base, standing up from it at right angles and contorted to form an outline such as was desired to be given to the ornamentation. If green was to be the color for leaves, then each leaf was formed of the band, and closed to contain the green. Each petal of a red rose would, in like manner, be enclosed so as to form a gold pocket, in which the red paste would be melted into glass. Specimens of "cloisonne" enamel of European manufacture are rare. The Louvre collection comprises hardly more than one example, but that is a magnificent one—the cover of a book of the Gospels. Chambers' Journal.

SODIUM PEROXIDE.—This compound has been brought into commerce for use as a bleaching agent. It has the appearance of a yellowish, pulverulent, or partially aggregated mass, very readily soluble in water and hygroscopic. In contact with water heat is evolved and oxygen disengaged, which excites coughing. Dilute acids give rise to the formation of hydrogen peroxide, but its decomposition must be prevented by cooling the liquid. Sodium peroxide may be handled without danger, but some caution is necessary in bringing it into contact with organic substances. It may be heated with dry aniline or benzene without risk, but when water is added to the mixture with benzene it takes fire with a kind of explosion. As compared with 1.5 per cent hydrogen peroxide (= 12 per cent by volume), sodium peroxide contains 20 per cent of active oxygen, and it has the advantage, as a solid material, of being more convenient for transport. It is also more capable of being kept, without alteration, than hydrogen peroxide. For convenience in use it is mixed with magnesium salts, and a material of this nature is made under the name of "oxygen powder." In using it or sodium peroxide care must always be taken to mix with water in very small proportions at a time and to prevent rise of temperature.—Pharm. Centralb.

FULTON ENGINEERING AND SHIP BUILDING WORKS.

Successors to FULTON IRON WORKS (Hickley, Spleen & Hayes), and F. A. HUNTINGTON,

Engineers, Machinists and Iron Founders.

Electricity.

The Naval Search-Light.

Electricity has added an almost incredible percentage to the efficiency of our naval establishment, and the rapidity with which it has been adapted to purposes of warfare, and the completeness of the revolution it seems to be making in methods, are fairly marvelous. The search-light alone almost doubles the capacity of the ordinary ship of war.

When the British bombarded Alexandria the search-lights on the vessels composing the squadron served not only to make the harbor as light as day on the darkest night, but enabled the admiral to observe the operations of the enemy on shore in the construction of batteries and earthworks, thus placing the Egyptians at a decided disadvantage.

It will enable a vessel to engage the enemy at night to almost as good advantage as during the day. It is useful in chasing a flying enemy and in conducting the management of a fleet. The assistance it gives in reconnoitering a coast will be readily appreciated. Difficult movements, such as entering a tortuous channel by night, passing between the vessels in a crowded harbor, and making a landing when the saving of time is of supreme importance, are all rendered comparatively easy by the search-light.

The search-lights of the British squadron at Gibraltar were the means of saving hundreds of lives when a merchant steamer sank in that harbor a few months ago. An effective search-light will make it almost as difficult for a torpedo boat to reach a warship by night as it is by day. Indeed, so difficult does it render the attempt that it has now been decided that the torpedo vessel and everything belonging to it, even to the faces of the men, must be painted black to avoid discovery.—N. Y. Advertiser.

ORNAMENTING BY ELECTRICITY.—The ornamenting of glassware by the application of electricity is being developed in a practical way in Philadelphia. It is the application of an old device to a new use. The tool used for engraving upon glass consists of a brass tube lightly packed with shredded asbestos and through which pass two conductors which terminate in two hindling posts. Projecting from the end of the brass tube is a pointed piece of slate, against which rests a piece of platinum wire, whose ends are fastened to the binding posts. Through the large tube is a smaller brass tube extending to the bottom, permitting of a flow of cool water which goes through the handle and passes off through another tube. A current of 50 amperes and five volts is sent through the platinum wire, which is heated to incandescence. The pointed slate pencil supports the wire and permits of a moderate pressure being applied to the point without injuring the wire. The operator holds in one hand the object to be engraved upon, and, in the other hand, the tool with which he writes. The film of red-colored glass upon the outside is so thin that the least scratch will expose clear glass, and all marks thus made upon the surface stand out transparent against a red ground. The principle upon which it works is as follows: The heated platinum wire, as it touches the glass, causes the part immediately underneath to expand and chip off from the body.

AUTOMATIC ENERGY AND CONTROL, as developed in the big power plant of the World's Fair, will be as complete and finished an example of mechanical progress as modern skill can supply, says the *Age of Steel*. The boilers in the plant are supplied with burners for oil, the valves connected by electricity with the pressure gauge, so that a rise in the pressure of steam decreases the flame of the burners. The demand for oil is indicated automatically at the oil tanks, and supplied by the opening of electrically connected valves in the tanks and oil pumps. The supply of water is regulated in the same way, while in addition each engine has a duplex signal which rings an alarm when the steam or water rises or falls to the danger point. This automatic manipulation very aptly illustrates modern progress in labor-saving mechanisms.

The electric light is rapidly winning its way into popularity. The English custom-house authorities talk of using it when searching for contraband goods on vessels carrying explosives, and so reducing the danger of explosion. The Irish Cattle-Traders' and Stock-Owners' Association, of Dublin, is said to be agitating for an extension of the facilities for veterinary inspection by electric light. Such facilities are afforded in the port of Cork, and should, they

consider, be afforded in other ports that are largely used in the shipment of cattle. A novel use of electricity as an illuminant is an electric bicycle-lamp, which is said to give a brilliant, intense and steady light. The lamp is connected to the battery by a cord with a plug at the end, which fits into the terminals of the cells. The accumulator is contained in a leather bag secured in place by straps. The light can be turned on or off while the bicycle is at full speed by means of a switch at the bottom of the lantern. The lamp is so arranged that it can be detached in a short time, and without much trouble. And if it is true that the policemen in certain parts of London have recently been supplied with incandescent lamps, instead of the clumsy and dirty dark lantern, we commend the civilization of the authorities in those parts.—Invention, of London.

THE purification of starch of an inferior quality by an electric process has been found so effective that the starch so treated is superior to that formerly known as the first quality, and is sold for a higher price than the latter. The manufacturers of starch who adopted this process are quoted as saying that in the first year of its operation the plant paid about three times its value by the saving in expense of operation over the old method.

A NUMBER of electric clocks are to be erected in Vienna by a company which has been formed there with that object. The pillars that support the clocks are to be utilized for advertising purposes, and will be the source of the company's revenue.

Useful Information.

Sick Headache.

Attacks of sick headache could often be avoided if the cause of them were known. In many instances the cause is a disordered condition of the stomach. In such cases there is often a regular recurrence of the attacks, the person in the meantime feeling perfectly free from the complaint.

Here it will often be found that by some error of diet the patient is gradually accumulating in his system some noxious substances, which it takes a special effort of nature to throw off. Then the whole internal machinery refuses to do its ordinary work. The stomach, the intestines, the liver and other organs which produce the digestive juices almost entirely cease their regular task of rendering the food taken into the mouth fit for absorption into the system at large.

Sometimes habitual overeating will produce this result. Or a person who has been constantly active may continue to eat his usual amount of food after exchanging his occupation for some more sedentary one. In either case the result is the same; the overburdened organs become partially paralyzed, the undigested food acts as an irritant, and headache and general disorder in the digestive tract prevail.

A person who has no symptoms of stomach disorder, or who has been taught by his physician to avoid indiscretions which formerly resulted in trouble, and who still has regularly recurrent attacks of sick headache, must look to some other than these, the most common causes of such attacks.

One not uncommon cause of sick headache is irregularity of the cornea or some other eye derangement. The skillful oculist will be able to detect any such irregularity, and to judge whether or not it is sufficient to cause the trouble.

Sick headache is very apt to occur in school-children from leaning forward over books, from imperfect digestion, or from too little exercise in the open air, and not infrequently from a combination of these unhygienic conditions. A child who suffers from sick headaches should be promptly relieved from such unwholesome influences.—Youth's Companion.

The Sun and the Stars.

The sun is a star, and the stars are suns. This fact has been a familiar one to astronomers for many years. That the stars shine by their own inherent light and not by light reflected from another body, like the planets of the solar system, may be easily proved.

That many of them at least are very similar to our own sun is clearly shown by several considerations.

Three facts prove this conclusively. First, their great intrinsic brilliancy, compared with their small apparent diameter, a diameter so small that the highest powers of the largest telescope fail to show them as

anything but mere points of light without measurable magnitude.

Second, their vast distance from the earth, a distance so great that the diameter of the earth's orbit dwindles almost to a point in comparison. This accounts satisfactorily for the first fact. Third, the spectroscopy—that unerring instrument of modern research—shows that the light emitted by many of them is very similar to that radiated by the sun.

Their chemical and physical constitution is therefore, probably analogous to that of our central luminary. The red stars certainly show spectra differing considerably from the solar spectrum, but these objects are comparatively rare, and may, perhaps, be considered as forming exceptions to the general rule.—Gentleman's Magazine.

Where Horses Ride.

Ontario, Cal., has a street railway that is operated by horse-power and partly by gravity. When the town was founded an avenue 200 feet wide was laid out with space in the center for a street-car line. The avenue is six miles long, running from the town of Ontario to the mountains with a steady ascent varying from 100 to 250 feet to the mile. In December, 1888, the railroad was completed and horse cars put on. A couple of ingenious mechanics, J. B. Tays and James Birch, decided that the horses might as well ride on the down trip, and accordingly designed a small platform car, which slides under the main car, for the descent. On this the horses ride down, the car running by gravity. The arrangement has been in successful use since March, 1889. The down trip is regularly made in 30 minutes, but the cars sometimes come down in half that time without stops.

Another Use for the Onion.

A very convenient mucilage can be made of onion juice by any one who wishes to use it. A good-sized Spanish onion, after being boiled a short time, will yield, on being pressed, quite a large quantity of very adhesive fluid. This is used quite extensively in various trades for pasting paper on tin or zinc, or even glass, and the tenacity with which it holds would surprise any one on making the first attempt. It is the cheapest and best mucilage for such purposes, and answers just as well as many of the more costly and patent cements. Some of the cements sold by street fakirs at 10 cents a bottle consist of nothing but onion juice and water, and the bottle and cork cost a great deal more than the contents.

CLOTH THAT STOPS BULLETS.—The cloth cuirass invented by Mannheim, a tailor, to resist the small-caliber bullet, and recently approved by the War Department, was tested at Mannheim. Uniforms of the new cloth placed on wooden effigies were not pierced by balls fired from points of 100, 200 or 300 meters distant. At shorter range the wooden figures were so deeply dented that the officers concluded the force of the impact was sufficient to stun a man. To make the cuirass, the tailor probably applies a secret preparation to an ordinary cloth tunic. The prepared tunic weighs six pounds. The prepared cloth could not be used to protect the arms and legs, as it would hamper the movements of a soldier.

20-Stamp Mill for Sale.

In Southern California, a 20-stamp Gold Quartz Mill, with engine, boiler, self-feeders, rock-breaker, etc. As the premises are adjacent to Railroad, the Mill could be conveniently removed. Can be had at low price for cash. Address "Quartz Mill," care MINING AND SCIENTIFIC PRESS, San Francisco.

Sampling Works for Sale.

The works are situated at Daggett, Cal., in the Calico Mining District, and on side track of the Atlantic & Pacific Railroad. They contain a first-class 60-horsepower engine and 46-horsepower boiler with Ore-crusher and other machinery, Mill scales, Assaying outfit, etc., all nearly new. Also upon the premises an office building and a comfortable dwelling-house (portable). The above can be had at a bargain. Apply to JOHN H. GILLESPIE, 1814 Stockton St., San Francisco.

CALIFORNIA MACHINE WORKS, WM. H. BIRCH & CO., ENGINEERS AND MACHINISTS,

No. 119 Beale St., - - San Francisco.

—BUILDERS OF—
Steam Engines, Saw Mills, Mining Machinery, Dredging Machines, Rock Crushers, Cable Railway Machinery, Elliptical Air Brake Co.'s Patent Steam and Hydraulic Elevators, Air Cushions and Air Brakes. POSITIVE SAFETIES. Improved Ram Elevators, Sidewalk and Hand Hoists. B. E. Hendrickson's Patent Automatic Safety Catch.

Machines of all kinds Made and Repaired. Orders Solicited.

FOR SALE.

One Ohmen's 12 x 12 Automatic Engine; best style in use. Also, 1 Boiler 48 in. x 16 ft. Both nearly new. Apply to J. W. QUICK, 241 First St., (Top Floor) San Francisco, Cal.

ARTIFICIAL LEGS AND ARMS

WITH RUBBER FEET AND HANDS.

It is not unusual to see an engineer with hand on the throttle, or a conductor, brakeman, fireman, carpenter, mason, miner, in fact men of every vocation, wearing one or two artificial legs with rubber feet, Marks' Patents, and performing as much labor as men in possession of all their natural members. Over 14,000 artificial limbs of Marks' Patents in use. Purchased by the U. S. and many foreign governments. One-half of the limbs furnished by us are made from measurements without our seeing the wearers. Fit guaranteed. A treatise of 490 pages, with 250 illustrations and a formula for measuring sent free. Address, A. A. MARKS, 701 Broadway, New York.

HEALD'S

BUSINESS COLLEGE,

24 POST ST., S. F.

By the wonderful MacArthur-Forrest Process, Controlled by The Gold and Silver Extraction Mining and Milling Co. H. A. W. Tabor, Pres.; Leonard Gow, V. Pres.; H. A. Jones, 2d V. Pres.; P. Geo. Oow, Technical Mgr. and Asst. Treas.; T. L. Wiswall, Gen'l Mgr. and Sec'y; Peter McCourt, Treas.; W. L. Cooper, Eng.

TRADE MARK.

On the D. & R. G. R. R., near the R. R. Depot.

THE CASSELL GOLD EXTRACTION CO., Also in Australia, South Africa, New Zealand, Queensland, Etc.

General Office of Company:
Rooms 8, 9 & 10, Tabor Grand Opera House Block, DENVER, COLORADO.

Also mills in operation as follows, viz: The Denver Mill, Denver, Colo.; The Livingston Old Mining Co., Boulder Co., Colo.; The Puzos Gold Mining and Milling Co., Boulder Co., Colo.; The Cripple Creek Gold Extraction and Power Co., Colo.; Calumet Gold Mining Co., Middle Creek, Shasta Co., Cal.; The Shasta Gold Ex. Co., Middle Creek, Shasta Co., Cal.; The Mercur Old Mining Co., Fairfield, Utah; Champion's Mines, Humboldt District, Yavapai County, Ariz.; The Crowned King and Last Chance Mine, Yavapai Co., Ariz.; The Union Mines, Maricopa Co., Ariz.; The Revenue Con. Gold Mining Co., Revenue via Nogales, Mont.; The Croighton Mining & Milling Co., Croighton, Cherokee Co., Georgia; and others in course of erection.

The object of this company is to introduce the Mac Arthur-Forrest process.

We have purchased from the Cassel Gold Extraction Co., of Glasgow, Scotland, the exclusive right for the United States to use patents covering this process.

If you desire an experimental test communicate with the secretary.

If the results of the tests are favorable, we will then make arrangements to treat a quantity of not less than five tons at Denver.

We are fully prepared to grant royalties to mine and mine owners, or rights covering districts and counties.

The process consists of pulverizing the ore to a fineness of about 60 mesh, and then subjecting the same to an action of a very diluted solution of cyanide. A few tubes especially constructed according to our diagrams, for triturating, settling and filtering, is all that is required extra in connection with any kind of pulverizing stamps or rolls.

The total cost, as a rule, does not exceed from \$2.50 to \$5.00 per ton.

The most desirable class of ores for this process the so-called refractory gold ores, pyrites, hematites manganese and tellurium. We have also treated successfully dry silver ores.

We will be pleased to answer any inquiries and furnish any desired information. Address,

T. L. WISWALL,
P. O. Box 926. Gen. Mgr. and Secretary.

WELL MACH'Y All Kinds, Water, Gas, Oil, Mining, Ottholing, Pumping, Wind and Steam Heating Boilers, &c. Will pay you to send 25c. for Encyclopedia of 1500 Engravings. The American Well Works, Aurora, Ill., also, Chicago, Ill.; Dallas, Tex.; Sydney, N. S. W.

Scientific Press

Patent Agency.

ESTABLISHED 1863.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 220 Market St. S. F.

Iron cut, punched and formed, for making pipe on ground where required. All kinds of Tools supplied for making Pipe. Estimates given when required. Are prepared for coating all sizes of Pipes with a composition of Coal Tar and Asphaltum.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

PIONEER DISTRICT.—*Record*, March 23: Pioneer and vicinity begins to loom up once more like an Iowa cornfield in a cyclone. There have been several new developments of late and among the principal ones is the Bowman-Zumalt mine. This mine is worked through a tunnel some 200 feet in length and they have opened up a ledge of high-grade ore. The happy owners have just pocketed \$900. The proceeds from about 70 tons of ore. The Loretta, another new discovery, is owned by John Wexley and Joseph Dilly. This mine at present ranks among the chiefs of the district. The ledge is well defined and bears every indication of being a permanent vein. They have out about 15 tons of ore that prospects all the way from \$60 to \$150 a ton. At the Irma mine the shaft is down something over 200 feet and at present they are running levels. They have some very fine looking ore and it is quite evident that the stockholders will be handsomely reimbursed for their outlay, push and energy. John Harker, Jr., has struck a very promising mine. The ore will pay about \$30 a ton. This young man deserves a great deal of credit. He is home from school on a vacation, and instead of sitting down he pulled off his coat and went to work and developed a fine looking ledge. James Toop has bonded his mine to David Fisher, who contemplates putting on a full force of men in the early future. This is a large vein and should it prove to be a paying one it will be something more than an ordinary mine for this section and also a valuable piece of property. Albert Kimball is reopening the old Soto mine. In early days this mine was worked and proved to be rich. No doubt with proper handling it will take its place once more on the list of paying mines. The Pinevetta has outabout ten tons of medium ore on the dump. At the Amador View mine there is considerable good ore in sight and with flattering prospects for a valuable mine. This mine has not been worked steadily this winter.

RICH POCKET.—*Calaveras Chronicle*, March 22: We have been informed that a pocket was struck in the "Roaring Gimplet" mine on the Amador side of Mokelumne river, just above Big Bar, from which \$1200 was taken out one day last week.

WILDMAN.—*Amador Record*, March 22: Last evening at the Wildman mine James Littlecot narrowly escaped death. He was standing on the ladder at the 900-level unscrewing a joint of water pipe near at hand. His efforts apparently moved the whole pumping apparatus and unscrewed a joint nearly 200 feet above him and the whole thing went crashing down to the 1100 level. In the descent it knocked Mr. Littlecot from the ladder, but he managed to catch hold of the timbers 25 feet below, thus saving himself from a terrible death. In all the history of its working there has never been a fatal accident in the Wildman mine. This exemption may be called luck by some, but as one of the miners said, it is the perfect system down to the minutest detail inaugurated in the mine by the superintendent, which causes that luck to be the perfection of safety to the men.

INCREASED ACTIVITY.—*Amador Ledger*, March 25: It has been well known and currently reported on our streets for several months that S. H. Howland, formerly of the Hardenberg or Casco mine, near the river, carried with him to Boston an option on the Gwinn mine, located in the Gwinn canyon, in Calaveras county, about a mile from Middle Bar, and at present owned by a son of ex-Senator "Duke" Gwinn. This mine has already turned out a vast quantity of gold, and there seems to be no doubt in the minds of those familiar with it that, if properly conducted, it will prove to be one of the best paying mines in the State. The ore was very rich in most of the levels, especially in the 700, 800 and 1300. The shaft was down 1500 feet, with levels run from 300 to 400 feet from the stations. Mr. Howland went direct from here to Boston to see his folks and to present the proposition of reopening the property to a number of Boston capitalists with whom he had done business in the past. They seem to have been favorably impressed with the proposition, for he writes that he will be upon the ground in a short time to reopen the shaft and levels, construct a hoist, erect a mill and go to crushing at least 100 tons of rock per day. This enterprise, if it turns out as Mr. Howland expects, will prove of vast benefit to Jackson, as it will employ many Jackson miners, and much of the trade will come this way.

BLAZING STAR.—The Blazing Star, located a mile from West Point, is about to resume operations. The owners are putting in an electric plant for the purpose of reducing their ores, which is a new thing in this State, and will be watched with a great deal of interest by all miners, and more especially by those in districts where rebellious ores are encountered.

WILL OPEN AN OLD MINE.—W. D. Chambers has secured a mining property from Ginochio Bros., which is located near the Mokelumne river. The claim was worked many years ago with good results. Mr. Chambers will, as soon as the weather permits, proceed with the development of the property.

EIGHTY-DOLLAR ROCK.—Henry Zumalt is developing a claim in the Pioneer district which is proving to be a bonanza in a small way. The property was worked many years ago on the surface, and was very rich; then the owner tried to find the ledge lower down by driving a tunnel, but missed it. Zumalt, a short time ago, had better luck and found the ledge. A few weeks ago he had ten tons of ore crushed

in Sydney James' mill, and it netted him, above the expenses of hauling and crushing, \$80 per ton. He has two shifts at work getting out the rock, which he will haul to the mill as soon as the weather will permit. He estimates 100 tons in sight, all the same quality of rock as that which yielded \$80 per ton.

MISCELLANEOUS NOTES.—The Hardenberg people have got through the cave in that mine and found that but one set of timbers had fallen. This was repaired. The water is being pumped out, and in a few weeks they will be sinking in the shaft. The Zsile people were compelled to move their water pipe in a great hurry to prevent its being washed down the south branch from the place where it was put to "set" after being tarred during the recent storm. The bank upon which it rested was entirely washed away. The men at work in the Irma, in Pioneer district, were driven out of the mine on Monday by the water from the creek, which completely flooded the mine by running down the shaft. As soon as the water in the creek falls, a few days' pumping will suffice to get the water out of the way. The Albany, the Littlefield and the Astoria tunnels are being extended as rapidly as possible with one shift of miners at each place. At the Littlefield the superintendent says that he expects to cut the vein at a very early date, tapping it about 100 feet from the surface. This vein is very prominently exposed on the surface and shows good milling prospects. At the Ivanhoe, in Plymouth district, the Messrs. Wheeler are running a five-stamp mill and crushing about 12 tons of ore in 24 hours, which yields from \$3 to \$5 a ton. They are hoisting about 70 feet with a whim. They are running levels now at that depth.

FROM OLETA.—*Cor. Amador Dispatch*, March 25: The old Ben Bacon gravel claim on American Hill, that has been worked for the last four months by D. Townson, J. Neff and others, is turning out some very fine gravel—20 and 25 cents to the pan is considered small. We are satisfied that there are a number of so-called worked-out gravel claims in this vicinity that are now laying idle that would pay well if properly handled; but many of the owners are not what could be called prospectors.

Calaveras.

AT WEST POINT.—*Calaveras Chronicle*, March 22: The Blazing Star mine has started up with a small crew, but it is expecting to increase soon. The Lone Star has laid off a number of its force.

Inyo.

BORAX OPERATIONS.—*Index*, March 22: M. H. Bush, of Alvord, was in town on Monday. He reports an accumulation of 1400 sacks of borax at Conn & Trudo's works, in Saline valley, owing to a blockade of the wagon-road over the mountains, occasioned by the storms of the winter. The road will soon be repaired and hauling commence. Bush and his partners are making 16 sacks of borax per day at a marsh in Nye county, Nevada, about 10 miles from the California State-line. This will be hauled to Alvord, a distance of 94 miles, and shipped by rail.

Nevada.

GOON DIVIDEND.—*Grass Valley Telegraph*, March 26: The North Star Mining Co. has declared dividend No. 8, payable on March 20, 1893. The dividend was 50 cents per share. There are 100,000 shares in the mine and this No. 8 dividend makes \$400,000 declared. That is a mighty good showing for a mine which not a great many years ago, was supposed to be worked out. The North Star is destined for a long life yet, and it is being most ably managed by Supt. Abadie.

GRIZZLY RIDGE MINE.—*Grass Valley Telegraph*, March 25: This afternoon Peter McAusland was in town. He is the owner of the Grizzly Ridge mine, said mine being situated near Columbia Hill, in this county. Mr. McAusland brought down with him some of the very best kind of ore from his mine, and there were very many old miners who saw it and would talk among themselves, and we heard many of them say: "You bet your life that's good rock."

Placer.

BIG DIPPER MINE.—*Grass Valley Telegraph*, March 22: Charley Smith has just returned from the Big Dipper mine, near Iowa Hill, Placer county. This mine used to be known as the Harmon mine and it is very rich. Charley Smith says that the gravel claims in that section are all looking well, and that a lively season is confidently expected. The Big Dipper mine is owned by Columbus Waterhouse, of the firm of Waterhouse & Lester, San Francisco.

Shasta.

GLADSTONE.—*Shasta Courier*, Mar. 25: The Gladstone mill near French Gulch is running steadily, about 75 men being employed at the mill and mine. The Brown Bear at Deadwood is employing a force of between 65 and 70 men. The Schroters have been making some improvements on the pumping machinery at their mine near town, in order to facilitate getting out ore. They are working a force of about five men, and are taking out some very good rock. The chances are that active operations will be begun on the Deaken & Taylor property at Lower Springs. A small force is waiting to begin work as soon as the weather permits. It is reported that the Calumet works, which have been idle for some time, will start up about the first of next month. The heavy rains of the past few weeks have furnished plenty of water for placer diggings, and the miners have been making the ground fly. The Walker mine at Old Diggings is about the only one in that locality where operations are being conducted on anything like a big scale. The mill is running steadily. Supt. Rippe's has struck the ledge in the lower tunnel, which is in 900 feet and taps the ledge at a greater depth than ever, exposing

a body of fine ore. Geo. A. Slocum and Mill Davis have been working the placer mine, across the river, owned by themselves and Frank Young of Shasta. They cleaned up over two ounces a day, when they had water. Lack of water is the main drawback, as the construction of a ditch would involve a considerable outlay of money. They have ground enough to keep them busy for two years, even with a good supply of water. Some of the nuggets taken from the claim are beauties. Frost, who, with Garrecht, took out \$2200 on Canyon Gulch recently, has sold a quarter interest for \$1000 to a man named Huse, who will work the property. They have favorable indications, but there is too much water to push work. Connor is running a tunnel on his ledge on Salt creek to tap the vein below the point where the pocket was taken out, and expects to strike the ledge soon. He has also been floating timbers down to his mines near the Tower House, preparatory to making further developments on the property this spring. Parker, who handled the Doebelin mining property near Muletown, has, we understand, left the diggings. The mines are all right, however, but require capital to develop them. There are parties ready to take hold of the property as soon as Parker lets go of it. Frank Tucker and Jim and Harry Paige have located a deposit of asphalt between here and Middle creek, the first ever discovered in this section.

FROM LOWER SPAINOS.—The borders of the Deakin and Taylor property have commenced operations. Two of the parties concerned are here taking part in the work. Connor's Co., on Salt creek, are still advancing their tunnel ahead. They are encountering strong ledge matter and are confident of striking the vein soon. McTimmons, of the Gipsy mine on Salt creek, informs me that the shutting down of the property was due to an increase of the flow of water in the shaft. As soon as the weather settles, the owners will probably erect machinery, so as to work the shaft more systematically.

Siskiyou.

PLACERS.—*Yreka Journal*, March 29: The Spangler Bros. are making preparations for big work in their extensive placer mine at mouth of Humburg creek this season. They will open up the claim from Klamath river along the creek bed, having just secured a fine double-act or double-cylinder 15-horse power steam engine, to hoist the pay gravel into the sluices and also hoist or haul out of the way the immense boulders at the mouth of the creek. They will also drain the claim with a large pump run by an overshot wheel in the creek, using both creek and spigge water for sluices. In case the creek gets too low to run the wheel in midsummer, a wheel will be placed in Klamath river, or else the work may be continued day and night by steam power. The pump must be kept working all the time, hence the necessity of a water-wheel for the pump when the claim is only worked during the day time. An exceedingly rich find of cinabar has been discovered lately by H. J. Barton and P. C. Lange, on Klamath river, opposite the mouth of Horse creek, below Oak Bar, the claim being known as the Molly O'Leary mine. From prospects so far realized, this mine is destined to prove one of the cinabar lodes in the State, and is also believed to be very extensive. Archie Nichols has been taking out some very rich specimen quartz lately from his ledge on the north fork of Greenhorn, and should he find the ledge permanent, it will be a fortune. C. A. Bogart & Co. have been ground-slucing steadily for some time past at their placer claim on Dutch creek, Klamath river, and expect to realize a handsome yield. They intend to keep on sluicing until the water supply gets low before making a clean-up. Austin & Co., of the Greenhorn blue gravel mine, have finally succeeded in fishing up their big pump, after considerable hard work in pumping out sufficiently with a number of small pumps. Their big steam pump is now fixed up in first class order, which will keep the claim drained for good work as soon as the water is all pumped out. The shaft is over 100 feet deep, which, with the drifts, contains a great amount of water, and a heavier flow is coming in at the present time than at any other period of the year, but not more than the pump can handle easily. A. Kaiser and H. Nicholas have taken out about 25 tons of good-looking quartz from the Clark & Wheeler ledge on Humburg, and will continue getting out more, so as to have a good supply for crushing by the time the snow melts off the road for hauling to mill at the forks.

Tuolumne.

TOO MUCH WATER.—*Tuolumne Independent*, March 25: Mining operations have been virtually suspended until the weather settles. It takes pocket-miners most of their time to get rid of surface water, and other miners are not delighted with the over-abundant soaking the country has had.

NEVADA.

Washoe District.

CON. CAL & VA. MINE.—*Virginia Chronicle*, Mar. 22: 1500 level—Have continued to extract ore and old fillings in working upward in the old south stope, from the 10th to the 15th floors above the sill floor of this level. 1600 level—Are repairing the main south drift and the east crosscut leading therefrom to the upraise connection with the north drift on the 1500 level. Also extracting a few tons of ore from the old stope east of the main south drift. 1650 level—Have continued making necessary repairs to the drifts on the sill floor of this level. We continue to extract some ore from the old stope, eight floors up in the upraise No. 6 carried up from the main northwest drift; also from the old stope in working north from the crosscut run west from the northwest drift. From these north workings, 27 feet up, a west drift has been advanced 30 feet in a porphyry and quartz formation carrying a low

assay value. From the winze which was sunk from the crosscut run west from the northwest drift, at a point 12 feet down, we are working east and west in the old timbers and extracting some ore therefrom. Have extracted during the week from all parts of the mine 611 cars of ore about 605 tons. Shipped to Morgan mill 867 1270-2000 tons of ore. Average assay value, per railroad car samples, \$32.15. The average assay value, per battery samples, of all the ore worked at that mill during the week (845 tons) was \$28.11 per ton. Bullion shipped to the Carson Mint, assay value, \$12,691.94.

OPHIA.—500 level—Jointly with Mexican Co. continue doing necessary repair work in the west drift from the main shaft, 1565 level—The winze now going down below the sill floor of this level has been sunk during the week 11 feet; total depth, 15 feet. In this sinking we have extracted during the week and raised to the surface 31 tons of ore, the average assay value of which is \$20.85 per ton. The bottom of this winze gives an assay value of about \$5 per ton.

MEXICAN.—On the 1565 level—West crosscut No. 2 from the north drift from the east crosscut from the bottom of the winze, sunk from the 1465 level down to this level near the south boundary, has been extended 20 feet; total length, 69 feet, continuing in a soft porphyry formation carrying clay separations and showing fine lines of quartz. Jointly with the Ophir Co. on the 500 level from the Ophir shaft continue doing some necessary repair work in the west drift from the main shaft.

UTAH.—340 level—The south drift from the main west drift at a point 595 feet in from the shaft has been extended 22 feet; total length, 205 feet; continuing in porphyry, clay and quartz formation.

SIERRA NEVADA.—The intermediate tunnel on Cedar Hill has been advanced during the week 14 feet, making the total length 232 feet; the face is in porphyry. The joint Sierra Nevada and Union west drift has been advanced 13 feet, making the total distance west of the joint shaft 3036 feet. The last ten feet has been in soft clay and porphyry, from which there is a flow of four inches of hot water.

UNION SHAFT.—The joint Sierra Nevada and Union west drift 900 level, has been advanced 15 feet, making the total distance west of the joint shaft 3036 feet; the last 10 feet has been in soft clay and porphyry, from which there is a flow of four inches of hot water.

ANDES.—North drift from east crosscut No. 1 north on 420 level advanced 11 feet; total length, 172 feet; formation quartz. We are also easing timbers in this drift.

BEST & BELCHER.—200 level—West crosscut No. 1, started in northwest drift, 170 feet from our south line, has been advanced 5 feet during the past week and work discontinued; face is in hard porphyry; total length, 135 feet. At a point in this crosscut, 67 feet from northwest drift, run a north crosscut 15 feet, passing through quartz giving low assays. 900 level—The southwest drift started in west crosscut No. 3, 20 feet from top of upraise No. 1, 1000 level, has been extended 22 feet; total length, 42 feet; face in porphyry. Suture tunnel level—The joint east crosscut with Best & Belcher Company has been advanced 32 feet during the week, passing through porphyry; total length, 115 feet.

GOTTL & CURRY.—200 level—During the past week west crosscut No. 5, started in northwest drift, 432 feet from main west drift, has been extended 17 feet; total length, 400 feet; face in porphyry. Suture tunnel level—The joint east crosscut with Best & Belcher Company has been advanced 32 feet; total length, 115 feet; face in porphyry.

HALE & NORCROSS.—Have completed repairs in south compartment and put in new guides from the 1100 to the 1300 level, so that the cage can now run through to the 1300 level in this compartment. Are now putting in new guides in the north hoisting compartment. Main incline—We continue making the necessary repairs. 1400 level—Have about finished repairs on this level. 1800 level—Advanced west crosscut on our south boundary 22 feet; total length, 32 feet; face in porphyry. The north prospecting drift from end of west crosscut No. 3, north of incline, was advanced 8 feet; total length, 50 feet. Have stopped work in this drift. During the week have done some work in the upraise started in No. 4 west crosscut from main north drift, but have suspended work for the present in this upraise. From crosscut No. 4 on our north line the Savage Company has started a drift into their ground.

CHOLLAR.—Are retimbering the west drift, 450 level, and making good progress retimbering the two north compartments of the main shaft above 930 level.

POTOSI.—East crosscut No. 3, 850 level, is on 310 feet; face is in clay and porphyry and streaks of low-grade quartz. The east crosscut opposite Potosi winze, 930 level, is out 321 feet; face is in porphyry. The north drift from top of raise, 1000 level, is out 208 feet; face is in porphyry and low-grade quartz. From this drift have started an upraise at a point 45 feet north from top of raise, 1100 level, which is 12 feet above the sill floor; top shows five feet of ore, car samples of which assay from \$20 to \$25 per ton. The east crosscut from the end of the south drift, 1000 level, is out 48 feet; face is in porphyry. Extracted and sent to the mill the past week 421 tons and 1500 pounds of ore from the 550, 930 and 1150 levels. Milled during the week 360 tons; on hand at mill, 144 tons. Average battery assays, \$24.69; average car sample assays, \$31.70. Shipped to U. S. Mint, Carson, 417 pounds of crude bullion.

ALPHA.—No work has been done on the 1800

level during the week, on account of timbering the Ward shaft.

EXCHEQUER.—No work has been done on the 1800 level during the week, on account of timbering the Ward shaft.

WARD SHAFT.—No work has been done on the 1800 level during the past week, as we are yet engaged in retimbering the shaft.

BULLION.—No work has been done on the 1800 level during the week, on account of timbering the Ward shaft.

APEX.—Have an incline winze in the ledge 20 feet, giving indications of finding a large body of ore, which is increasing in value as it attains depth. It is very encouraging to the owners and to the community to have such glowing prospects. J. A. Higginson, secretary and treasurer of the Apex Company, will arrive shortly from New York to inspect the property, when a large force of men will be put on to develop it. Operations have been retarded, owing to the inclement weather.

KENTUCK.—From the stopes above the 160 level we continue to extract from two to three tons of ore per day of the average value of \$30 per ton as per car samples. The south drift from the Jacket east crosscut on 1100 level is in 130 feet and continues in ore of fair quality.

OCCIDENTAL.—The main north drift on 750 level has been extended 12 feet; total distance from No. 1 winze, 687 feet; the face of the drift is in quartz and porphyry. East crosscut from bottom of No. 2 winze in south drift, 750 level, is in 11 feet, face showing low-grade ore. The Zigzag drift, Sutro tunnel level, is in 882 feet; face in hard porphyry.

CON. NEW YORK.—The winze below the 650 level is down on the slope 110 feet; the bottom is in quartz showing bunches of ore of good grade. The west crosscut from the southwest drift from the shaft, 850 level, is out 117 feet; face is in quartz yielding low assays.

SILVER HILL.—The southeast drift, 450 level, has been advanced 6 feet, through hard porphyry; total distance from north line, 78 feet.

ARIZONA.

DRAGON.—Tombstone *Epitaph*, March 26: A. H. Wein, who has a lease on the old Peabody mine, shipped a carload of 20 tons of copper ore on Saturday. This ore goes to New Jersey. This makes a total of 70 tons shipped since last September, with an average return of 38 per cent copper and 27 ounces silver per ton. Mr. Wien has another shipment ready that will run still better than any yet taken out. The mine has been worked by the present lessees and has proved a bonanza for them and a source of profit to the owners of the property.

DOS CABEZOS.—A few new ideas are creeping into this camp. One mine-owner at least has been found who will lease his property. Stewart and Madden, owners of the Ewell Springs, have consummated a deal with Boyer & Fitch, whereby the latter will work the property and reduce the ore on a percentage. The lessees have control of five stamps and two concentrators of the Cincinnati mill near the mine and will start them up on the ore. This transaction, which appears on its face to be a very commonplace one, is a revelation to the inhabitants of the Dos Cabezas mountains. It is the first time that an owner of a claim on the big ledge has been found willing to do business as it is done in other mining camps on the coast, and the *Prospector* is of the opinion that it will prove an entering wedge in the building up of Dos Cabezas district.

SILVER CAVE.—Our informant, who is just from Dos Cabezas, says that this mine is a bonanza. From three to four feet of ore has been uncovered that will average across that distance \$52 per ton, while assays in many instances run from \$200 to \$300. The shaft is now down 20 feet below the tunnel which cuts the big ledge. A drift on the ledge is being run east and this high-grade ore is being taken out and piled on the dump. Mr. Delong, who is managing the property, is willing to make terms similar to those made by Stewart and Madden on the Ewell Springs, with a bond for purchase.

THE CASEY GROUP.—Openings on this bonanza from one end to the other show this wonderful property to be all that it has been represented to be. A shaft has been started on the easterly end of the claim, out of which \$75 ore is being taken the full width of this shaft.

DOS CABEZOS NOTES.—T. C. Bain is taking out ore from his mine, formerly the Murphy. He has it opened with one 40-foot shaft, one 20-foot shaft and a 90-foot tunnel. Sam Hanson is working the claim adjoining the Bain property. He is running a tunnel to strike the ledge, which he hopes to encounter in about 10 feet more of work. Sylvester Porter is working the old Greenhorn mine, which was originally the property of Sid Elsworth, the pioneer stage-driver, who drove over the old Butterfield route in early days. The Greenhorn was one of the earliest locations of the camp. A tunnel is being driven to tap the ledge. The old Rouse mine, at Hungry Gulch, eight miles east of Dos Cabezas, now belonging to Dan Wanghalt, is to have a cannon-ball mill placed upon it by the owner, who recently purchased the one which has been idle for some time.

DAKOTA.

OIL AT NEWCASTLE.—Deadwood *Pioneer*, March 22: After about a month of hard fishing, the tools lost in the test well of the Eagle Oil Co., at Newcastle, have been recovered and the drill will now be started to reach the well down to the third sand. The well is now about 600 feet deep, in the second sand, in which a 25-barrel pumper of heavy oil was struck. According to calculations based on old oil districts, the third sand ought to be tapped at about 900 feet, in which there is every reason to expect a good strike, a gusher being by no means improbable. A strong pocket of gas was

opened in slate at about 300 feet, and other small veins at a greater depth, while the presence of oil has been apparent almost from the start. The drillers consider the prospects as very flattering.

THE SITUATION AT HARNEY PEAK.—The situation at Harney Peak remains unchanged, and the men have about as little idea as the outside world as to what the great tin company proposes to do. Mr. Childs is still in New York and is frequently heard from, but nothing definite has yet come of his visit and the idle workmen are feeling far from encouraged. Quite a force of men are still at work keeping the mines free from water, but beyond this there are no signs of activity. The impression still obtains that operations will be resumed, but this seems to be pure guesswork, and as the company don't seem inclined to divulge its intentions, time alone will determine the future of the Harney Peak properties.

NOTES.—The Buxton Co. is working some 12 men and placing good ore on the dump for shipment in the spring. The Golden Reward Co. is working a large force of men on its different Bald Mountain properties and on the Wells-Fargo group, in Blacktail, shipping to its own works daily about 150 tons of good ore. It is expected that the pump will be in place in the Horseshoe shaft in a couple of days, when operations will be resumed and the expected ore still further sought after. Mr. White is as confident as ever that the ore is there in immense quantity, and that he will soon find it. A pump has been started in the Comet shaft, which is about 50 feet deep, and the work of sinking resumed. This shaft is not on, but adjoins, the Comet property, whose owners are bearing a portion of the expense for the benefit it is thought to be to their property. Homestake dividend No. 176, of 10 cents per share, is payable March 25th.

IDAHO.

ANOTHER MINE CLOSED DOWN.—*Cœur d'Alene Barbarian*, March 25: The effect of the high freight rates charged by the railroad companies for the transportation of ore is rapidly manifesting itself in all parts of the Cœur d'Alene, and the owners of mines see no way out of the difficulty but by suspending work on their various properties. The prices quoted in the Eastern market for silver and lead, combined with what is regarded as exorbitant transportation, are proving serious stumbling blocks in the way of mining progress and prosperity. Following in the wake of the Bunker Hill and Sullivan, the owners of the Morning mine at Mullan on Monday last closed down all work for an indefinite period. In an interview with a representative of the *Panhandle News* regarding this shut-down Superintendent Huntley said: "It would be impossible for me to tell you what will be done in the future, but one thing is sure, the mine will not be touched again till freight rates come down or else the prices of silver and lead go up. Our mine produces low-grade ore, and under present conditions we cannot work the mine at a profit. It costs us but little less than \$3 to mine and tram the ore, which at times has not run more than three to four ounces in silver. This shut-down is not a question of labor and we are not trying to make a cut in wages. Our company recognizes that you cannot get good men in a country like this for low wages, so there are but two hopes—one for a raise in the price of silver and lead and the other for reduced freight rates. When the company purchased this mine last spring there were thousands of tons of ore blocked off. True, it was very low-grade ore, but we saw that there was a large body and that with a good mill and other facilities for handling it, it would be a good investment. The company has expended over \$400,000 here. We have a fine mill, and as soon as it pays to work it again we will do so. At the present time we have given it a good, fair trial. We have gone behind and we can better afford to let the property lay idle and pay the taxes on it and interest on the investment than to continue operations at a loss."

UTAH.

NEWS FROM THE CRESCENT.—*Park Record*, March 25: The Crescent is again looking up, and, with a fair price for silver, will make a much better showing during the present year than it did last, as the ore mine at the mine are filled to overflowing with first-class ore and a high grade of concentrating rock. The writer is reliably informed that the 400 level is panning out in a remarkable manner, and there is more and better ore in sight to-day than at any time during the past three years, and the chute gives every indication of growing better as depth is obtained. A deal has been on foot between the Crescent Company and Mr. Treweek of the Alliance, whereby the former will be given the privilege of extending the Alliance tunnel into Crescent ground. While the deal has not as yet been closed up, there is every prospect of its being so as soon as Mr. Treweek returns from the East. This will give the Crescent a chance to prove its ground to considerable depth, and demonstrate whether it is advisable to drive the long drain tunnel now under contemplation. If no agreement can be reached with the Alliance Company, there is little doubt but that the proposed drain tunnel will be commenced at once, and, in that event, a number of assessments will undoubtedly be levied before it is completed.

THE GLENCOE SOLN.—According to advertisement, the Glencoe property was sold at Marshall's sale yesterday to satisfy the judgment secured against it by the Utah & Montana Machinery Company. Deputy U. S. Marshal John L. Weber presided, and the property was bid in by C. P. Mason for an amount equal to the judgment and costs of sale. This places the property in a peculiar position, and is quite liable to involve it in serious litigation, as Supt. Curtiss has also secured a judgment against the same property for wages due himself and the men em-

ployed, and, as the *Record* is informed, the question of wages supersedes all other claims.

CAMP CROSSCUTS.—During the week the Ontario mill shipped 42 bars of bullion, containing 24,772.08 fine ounces of silver. The Ontario is shipping no ore at all these days, and the only hauling being done is to the mill. Very little ore is being taken out. Matters at the Ontario drain tunnel are progressing smoothly these days, and about ten feet a day is being made. The face of the tunnel is in hard lime which carries lots of water. No men have as yet been laid off at the Daly West on account of the accident last week. It is thought that the machinery will be repaired and in operation again within a few days. Considerable active prospecting is reported as going on near the divide between Thayne's canyon and Cottonwood in spite of the deep snow up that way. The work is being done on the Scott Hill side of the canyon. At the Bogan group of claims the work of sinking the big incline is going steadily forward with increasing prospects of a good body of pay ore being soon uncovered. So far, very little drifting has been done on the vein, though what has been done is very encouraging. The Daly Mining Company has declared its regular monthly dividend of \$37,500, payable March 31st, in Salt Lake, San Francisco and New York. The Daly is improving with each passing month, and, unless the bottom falls completely out of the silver market, will continue to pay regular dividends. Richard Mackintosh, the sampling millman, has made arrangements whereby he will use the Crescent concentrator for sampling Anchor and other ores until his new mill is completed, plans and specifications for which are now being prepared. The construction of the new mill will be commenced as soon as the weather settles down and the snow gets out of the way.

WASHINGTON.

THE OLD DOMINION.—*Colville Dominion*, March 25: The Old Dominion is again the scene of the most lively camp in the State of Washington. Of late very little has been known of the workings of the property, excepting that the company has lately exhibited unusual confidence in the mine and has arranged for the expenditure of something like \$100,000 in development work on the property. Last week a large additional force of men was employed at the mine and the output of ore consequently increased to almost double. All these outward appearances have had the effect of inspiring great interest on the part of the general public as to the real condition of the Old Dominion, which for the past eight years has been the chief source of distributing revenue to the large surrounding country. It now transpires that the mine has developed in the upper workline six feet of a vein of pure lead carbonates, which will run as high as \$500 in silver to the ton, and instead of being an ordinary pocket of this quality of crude stuff, it seems to be a well-defined vein, and no perceptible indication of running short in quantity. The nature and extent of the Old Dominion remains no longer an uncertain quantity. It is certainly the biggest and richest mine in the State of Washington. During the eight years that have elapsed since the discovery of the Old Dominion she has produced over \$2,000,000 worth of the precious metals of the country.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING MARCH 21, 1893.

- 493,972. — RAILWAY CATTLE GUARD — J. J. Burke, Roseburg, Or.
- 493,886. — SELF-CLEANING SCREEN — A. Fereva, Nelson, Cal.
- 493,887. — ALMOND-HULLER — A. Gamble, Nordhoff, Cal.
- 493,993. — FUNNEL — E. N. Gaudron, Portland, Or.
- 493,994. — FUNNEL — E. N. Gaudron, Portland, Or.
- 493,714. — METALLIC LATHING — E. Hawes, Sacramento, Cal.
- 494,010. — CULTIVATOR — H. M. Little, Rivera, Cal.
- 493,933. — CAR COUPLING — J. C. Look, San Jose, Cal.
- 494,067. — CAR COUPLING — J. C. Look, San Jose, Cal.
- 493,832. — FEED-BOX — J. L. Martin, Amity, Or.
- 494,112. — CANAL DIGGER — McMullen & Wood, S. F.
- 493,834. — LIN-HOLDER — D. O'Leary, Winchester, Cal.
- 493,877. — OIL CAN — T. A. Schleuter, Oakland, Cal.
- 494,046. — FOLDING GRATE FRONT — W. H. Vance, S. F.
- 22,301. — DESIGN FOR SPOON — W. S. O'Brien, S. F.

The following brief list by telegraph, for Mar. 25, will appear more complete on receipt of mail advices:

California.—Frederick W. Barkhaus Jr., Wrights, applicants for distributing water for irrigation; Lyman L. Dennick, Los Angeles, Ind.; George Edwards, Berkeley, heating attachment for gas burning; Edward H. Gerrish, San Francisco, liquid-shaking and cooling machine; Oscar M. Hill, Santa Paula, centrifugal honey extractor; Wm. L. Johnson, Pomona, salt box or cellar; Andrew G. Phillips, San Francisco, saw flier; Edward T. Taylor, Oakland, cash register and indicator; Wm. S. O'Brien, San Francisco, design for spoon-bender.

Oregon.—Frank Orth, Astoria, two patents for surgical appliances; Robt R. Parrish, Portland, fanning cover for beds, etc.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of especial mention:

CAR-COUPLING.—John C. Look, San Jose, No. 493,933. Dated March 21, 1893. The invention relates to the vertical-plane type, having pivoted hook-heads and pivoted guards, and consists in an automatic lock for the pivoted guard whereby it is held in a fixed position when the coupling is under draft and released when buffing, or when a coupling is to be made. It more properly relates to an improvement on a car-coupling described in patent No. 474,090, granted to the same inventor May 3, 1892.

CAR-COUPLING.—John C. Look, San Jose, No. 494,067. Dated March 21, 1893. This relates to the vertical-hook type of coupler, having a flat-face, pivoted hook-head, with a buffer-arm and guard integral with the draw-bar. It consists in a buffer-arm, the face of which is flat, or at right angles to the line of the draw-bar in order to meet the opposing flat-face hook-head and prevent the breaking of the hooks. It consists also in other devices, combinations and arrangements whereby the flat-face buffer-arm can be effectively used and other results obtained in connection with such arrangements. One of such other results is the turning of the pivoted hook-head in the coupling operation by lateral force instead of longitudinal impact. Another of such results is the forcing of the hooks into each other in drawing, and thereby getting the full strength of the hooks instead of allowing them to assume their positions voluntarily. The invention further consists in a novel chain-and-spring connection between the pivoted hook-head, commonly called the "knuckle," and the unlocking lever, whereby the knuckle is thrown open when the lever is set uncoupled and the cars are separated.

SELF-CLEANING SCREEN.—Antony Fereva, Nelson, Bette Co. No. 493,886. Dated March 21, 1893. This invention relates to the class of self-cleaning screens and consists in peculiar and novel combinations of endless traveling, shaking screen and rollers for supporting the screen, and with which it comes in close and direct contact, and adjustable tightening roller and a top supporting roller. In this device, by having an endless traveling screen which, during the course of its travel, comes in direct and close contact with the surfaces of the rollers, the cheat sticking in the meshes of the screen is forced out by this contact with the rollers, whereby the screen in its travel is enabled at all times to present a perfectly clear and clean operating surface.

ALMOND OR WALNUT HULLER.—Albert Gamble, Nordhoff, Ventura Co., Cal. No. 493,887. Dated March 21, 1893. The object of this invention is to provide a simple and rapidly operating machine for removing the hulls of almonds or walnuts. The unhulled nuts are supplied to the hopper, and by it are fed down upon a rapidly rotating cylinder. They are caught by the arms of the cylinder and hauled or thrown by force against a board or wall which forms part of the apparatus. The force with which the nuts strike against this wall is sufficient to cause them to rebound into the path of rotation of the beater arms of the cylinder, and, while still in flight, they are struck by said arms and the hulls are broken and disengaged from the nuts, both nuts and hulls then falling down upon the inclined bottom of the casing, and, passing under the wall, are discharged into a suitable receptacle. The nuts are not injured by the blows of the beater arms, as they are then in the air, and the blow delivered, while sufficient to break and disengage the hulls, is not enough under the circumstances to injure the nuts, as would be the case if they were struck by the arms while resting on some solid foundation.

FOLDING GRATE FRONT AND HEARTH.—Wm. H. Vance, S. F., assignor of one-half to Georges Humphreys. No. 494,046. Dated March 21, 1893. This consists of plates hinged together and pivoted or fulcrumed at the lower end, and adapted to fold up so as to lie flat in front of the grate and form a hearth, or to be unfolded and turned up so as to fill the entire grate-front. In conjunction with this is a damper.

MACHINE FOR FORMING CAN BODIES.—Robert D. Hume, Gold Beach, Oregon. No. 493,588. Dated March 14, 1893. This invention is designed to form can bodies for various purposes, and it completes them in a single continuous operation, commencing with the sheets of tin which are supplied at one end and are then cut to the desired size. They are then moved forward automatically and delivered to mechanism which bends the edges to form the interlocking hooks, after which they are advanced to devices which bind them into a cylindrical form, interlock the edges and close the seam. From this point the cylindrical bodies are advanced to a point where acid is applied to the seams to facilitate soldering, and are then delivered to the solder bath where melted solder is applied to the seams, the surplus being removed by wipers, after which the can bodies are delivered from the machine in a completed condition ready for the heads. The movements are all effected by suitable mechanism, the bodies being moved forward by carriers having an intermittent motion.

BACK FILES of the MINING AND SCIENTIFIC PRESS (unbound) can be had for \$3 per volume of six months. Per year (two volumes) \$5. Inserted in Dewey's patent binder, 50 cents additional per volume.

FRUE ORE CONCENTRATOR

OVER 3200 IN ACTUAL USE.

Manufactured under Patents of April 27, 1880; September 18, 1883; July 24, 1888; and March 31, 1891.

SAN JACINTO ESTATE, LIMITED,
Office of General Manager,
P. O. Address, South Riverside, San Bernardino Co., Cal.
CAJALCO, Dec. 18, 1891.

MESSRS. ADAMS & CARTER, 132 Market Street, San Francisco, Cal.—GENTLEMEN: After a continuous trial of different concentrators comprising the Frue Vanner, the "Holland," "Paradox," "Triumph" and the "Woodbury" concentrators, extending over several months, we find that we prefer the Frue Vanner, as it is easier of adjustment, runs smoother, has less wear and tear, and—having a positive travel—gives less trouble than the other more complicated and ever changing machines now in use here. The Frue Vanner not only saves cleaner concentrate, but has less loss in the tailings, and is in several ways preferable to the other concentrators here.
I am, my Dear Sirs, Yours faithfully,
S. HARRIS, Manager

California Street Paving Material.

Supervisor Denman deserves the thanks of the community for his efforts on behalf of good foundations for the bituminous pavement now being laid in this city. He has introduced a declaration of intention not to accept bituminous pavement laid upon a concrete foundation composed of red rock, and notifying the Street Superintendent to specify that none but clean sand from near Black Point and rock fully up to the specifications of the Board must be used in concrete foundations. Mr. Denman declared that he lately inspected a number of streets and found that the bitumen was wearing out, although they had only been accepted a short time. Upon a careful examination he invariably found that the pavement had not been spread upon a proper foundation. He said that he had been told that unless the rock and sand were properly made it did not matter how much cement was put in. Red rock will not stand the test, because it easily becomes mud and does not make good concrete.

There is plenty of good rock available, and its use should be insisted upon by the Supervisors and Superintendent of Streets. It is not necessary to limit the contractors to one special kind of rock, but they should be prevented from using that which is known to be bad.

The question of proper foundation for this kind of pavement is a very important one indeed, for no matter how good the bituminous material, unless laid on a good base, it soon gets in bad order.

An equally important consideration, however, and one to some extent ignored, is the character of the bituminous rock itself, with respect to the percentage of fixed bitumen it contains. California has the most extensive and varied deposits of asphaltum and bituminous rock in the United States, but there is a very great difference in these deposits as to the value of the material for paving purposes.

Some material has a high percentage of fixed bitumen and some has a very low percentage. That with a small amount is friable and apt to crack when the volatile oils have evaporated. This evaporation takes place more readily when the substance is spread out and exposed to the sun and air as when laid for street paving.

The better grade of material with a high percentage of fixed bitumen is almost a different substance, so changed are the characteristics. This is more plastic and much

more durable. After shipment it can be reduced with sand, and still be better than the poorer grades.

There should be a chemical examination of these paving materials, and more attention paid to the grade which is used on the streets. Some of it is unfit for use where there is heavy travel, by reason of its friability after some months use. There are so many good deposits to draw from in California, that it is unnecessary to accept the poorer grades of material simply because they are cheap. It will pay better to get good bituminous rock or asphalt in the first place, since it lasts much longer and requires less re-

A Blast Furnace Hoisting Machine.

The engraving on this page represents a Lidgerwood hoisting engine of the regular double cylinder reversible link motion type, with compound gear and improved throttle valve connection. They are made particularly strong and substantial in every part. Owing to their simplicity of design, they are not liable to get out of order or give out at a critical time; and as there is nothing about them with which an ordinary engineer is not familiar, they are very easily taken care of and run. This hoist is especially de-

signed for blast furnace work. The engines are designed to run two cages in the usual manner, one ascending while the other is descending, and the drums are of sufficient capacity to hold double ropes, if desired; or, being spirally grooved, a single rope with a few turns around the drum, and the ends fastened to the cages, will operate equally as well. Hammered steel drum, crank and intermediate shafts of great strength, are used to ensure safety. The safety brakes on the crank wheels are applied automatically, by means of an adjustable steel toe on the rocker shaft, by simply moving the lever to the central position, and are released as the lever is moved either way to hoist or lower. The cages are under complete control of the operator, and are handled by means of chains

DOUBLE CYLINDER REVERSIBLE LINK MOTION AND SAFETY BRAKE GEARED HOIST.

pairs. This is a matter to which the attention of the city supervisors should be turned.

SAN FRANCISCO parties are figuring on the possibilities of building another smelter in Stevens County, Washington. The chances are favorable that if they decide to operate there Colville will be made the base of operations. There have been some fine showings of high grade ore developed through the county during the winter.

The old Barbee & Walker mill at Silver Reef, Utah, which has been remodeled so as to run by water power, will be started up in a short time. It has a capacity of 50 to 75 tons a day. Chloriders are at work mining low grade ore, and good times are expected in the old sandstone camp.

NONE of the miners' unions or Montana have any connection with the United Mine Workers of North America, who threaten to strike in the Pennsylvania coal mines. Montana miners have an independent organization known as the State Association of Quartz Miners.

or ropes running up the hoistway. The cages are usually adjusted so that at the top and bottom they stop themselves automatically. All parts are made to gauge, on special tools, and are perfectly interchangeable, and finished parts of all sizes are always kept in stock. Every engine is thoroughly tested by steam at the works before being shipped to the agents here, the Parke & Lacy Co.

At the last meeting of the board of trustees of the Mechanics' Institute, Arthur F. Allen, a graduate of the University of California, was appointed instructor of mechanical drawing for the institute, in place of David Cummings, who submitted his resignation.

THE foreman of the coinage department of the San Francisco Branch Mint in this city reports the coinage for March as follows: Double Eagles, \$1,000,000; Eagles, \$250,000; Half Eagles, \$400,000; total coinage for the month, \$1,650,000.

FOUR THOUSAND MINERS are thrown out of work by the closing of several collieries in Rhodda Valley, South Wales.

Comment.

Those who look upon California as a gold-producing State only may be surprised at the figures of quicksilver production given in an article in another column. While they refer mainly to the product of only one mine, they give an indication of what has been done with quicksilver properties in this State. There are many other mines, some of them now producing quite largely. Quicksilver is one of the valuable products of California which no other State has to any extent. The same may be said of chrome ores. Borax is only found in California and Nevada. The values of these products never appear in the statistics of mineral production. There are many other mineral and metallurgical products for which we get no credit in the published statistics, these being based mainly in gold, silver, lead and copper. California does not, therefore, have the standing it really merits in point of mineral wealth. It is to be hoped that hereafter the State Mining Bureau will prepare the annual statistics of production of mineral substances, and not leave it to the United States Mint Department which gives figures only of gold and silver. With correctly prepared statistics published early every year by the State Mineralogist, and including all mineral substances, California would have a better reputation as a mining State.

San Francisco men are figuring on building a smelter at Colville, Washington; and parties from Portland, Oregon, are figuring on building a smelter at San Francisco. Apparently the disposition to go away from home to make investments in mines or reduction works is not confined to any one place. The more smelters there are the better it will be for the miners, for competition will bring about fair rates.

While the arrivals of foreign and coast coals have been light recently, we still took 117,800 tons at San Francisco in March. British Columbia gave us 34,400 tons, and we got 25,800 tons from Great Britain, 16,400 from Seattle and 22,500 from Tacoma, the rest coming from Australia and the East. The Vancouver Coal Company's mines at Nanaimo are the largest producers on the coast. The Vancouver Coal Company has two large mines, namely, the Nanaimo and the New Wellington, that are working three shifts of 400 men each, or a total of 1200 men. The output is from 1900 to 2300 tons a day, although it could be made 4000 if the demand warranted. The mines ship from 500,000 to 600,000 tons of coal a year to San Francisco, both by steam and sail. The owners, while denying that there is to be any cut in wages of miners, claim that they make no money, because coal is too cheap. The idea of coal being too cheap on this coast is rather amusing.

With coal at half its present cost, San Francisco manufactures would experience a revival. It is a good thing that the wheat fleet from Great Britain, by bringing coal here, keeps the coast coal prices down. That is, it is good for the consumer, although the colliery men do not view it in that light.

If there are now any hydraulic mines being worked surreptitiously, or contrary to law, in the area drained by the Sacramento or San Joaquin rivers, as claimed by the anti-debris people, they can only do so a few weeks longer. The penalty clause of the Caminetti law goes into force May 1, 1893, and anybody found illegally mining after that date may be fined up to \$5000 or imprisoned for a year, or both, and anybody destroying or damaging a dam or restraining works is subject to the same penalties. Some of the valley papers think all the monitors in the country were turned loose after the Ford bill passed. All the muddy water coming down with the winter floods is laid to illegal hydraulic mines. That some men have taken advantage of the abundance of water there can be no denying, but they have done this every year where possible. The large majority, however, are abiding by the law. Those who have not will be compelled to after May 1st. While the MINING AND SCIENTIFIC PRESS has advocated the resumption of hydraulic mining by legal methods, it has never expressed or had any sympathy with those few men who broke the faith pledged in their behalf by the State Miners' Association. These men have greatly injured the miners' cause for their own personal benefit. They are as much enemies to the mining industry as the anti-debris fanatics. If such men are caught violating the law, we shall rejoice in their punishment as much as the most ardent anti-miner. The Miners' Association, through its executive committee, has tried its best to stop illegal mining, but has been unable to control all individuals. They are few, as we have stated, but their acts have been magnified by opposing interests so as to include all the hydraulic miners in the State. A few weeks more, however, and these men will be confronted by grave penalties for violation of the laws. If they persist, punishment will follow, and they will receive no sympathy from the law-abiding mining community. The anti-debris papers can afford to wait these few weeks without stirring up further useless strife and contention.

Our anti-debris friends of the valley are needlessly alarming themselves on the subject of the effect of the Ford law and recent hydraulic mining legislation generally. In the MINING AND SCIENTIFIC PRESS of last week Senator Ford explained the situation very clearly. The miners are given no rights they did not formerly possess, but these rights are more clearly expressed in the code. They cannot now work hydraulic mines and commit injury any more than they could before. The reason the miners rejoice is not that they can go ahead and mine in any way they want to, but because both the Government and the State have officially recognized hydraulic mining as a legitimate industry when it can be carried on without material injury to the streams or adjacent lands. Congress had enacted a law to this effect before the legislature did the same. The limitations of methods of conducting the business are expressed in the Caminetti law which is now in force. The anti-debris associations and officers have had their own way for so many years that they have come to look upon their own way as the law. These congressional and legislative enactments, following the most recent decisions of the U. S. Courts, settle the whole matter. The talk of the valley people of accepting the Caminetti law because they like it, and rejecting the Ford law because they do not, is foolish. The State law is in direct line with the Government one. The miners can now mine, but under certain specified restrictions. These restrictions, however, are laid down by the United States laws, and not by our anti-debris association, and in this the miner has a distinct advantage. The people of the State generally are glad that there is now a special law on the subject which takes the matter out of the hands of prejudiced men on both sides of the controversy. The Government provides a Debris Commission, and the State provides one, these to work in conjunction. It is probable that they can settle all differences without assistance or advice from the Anti-Debris Association. It is now entirely an engineering proposition, to be determined by engineers, and prejudiced partisans will be apt to have very little to say.

D. P. CARR has been elected secretary of the Southwest Silver Convention, to be held at Silver City, N. M., on the 4th and 5th of July.

THERE is \$55,381,615 in coin in the Sub-Treasury in San Francisco. Of this, \$27,238,415 is in gold.

THE *Mining Age*, of San Francisco, Salt Lake and Denver, has suspended publication.

Record of a Quicksilver Mine.

The New Almaden quicksilver mine, Santa Clara Co., California, once the proud rival of the celebrated Almaden mine in Spain, has given up its second place to the Idria mine in Austria, and its production is steadily declining. Last year the total product was the least in its history for any twelve months work. The mine's highest production was in 1865, when it yielded 47,194 flasks of quicksilver of 76½ pounds each. This was an average of 3,933 flasks a month from 11.30 per cent ore. In 1892 the yield was 5,610 flasks or 467½ flasks a month from 0.72 per cent ore. As far back as 1877 the ore yield was down to 4.93 per cent, and then for many years it was between two and three per cent. In 1888 it was 2.40 per cent; 1889, 1.73 per cent; 1890, 2.02 per cent; 1891, 1.22 per cent, and 1892, 0.72 per cent. This is the first year in the history of the mine when its ore was below one per cent. In the early history of the mine the yield of the ore was between 20.22 and 36.74 per cent, and it was always above 10 per cent until 1867. The mine yielded 12,000 flasks in 1890, 8,200 flasks in 1891 and 5,610 in 1892. These figures of product and percentage, while not complete, show that the mine is pretty well worked out.

The quicksilver mines and reduction works of New Almaden are fifteen miles south of the city of San Jose, Santa Clara County, in the Santa Cruz mountains, at an elevation of 1700 feet above the sea. These mines were first worked for quicksilver in 1845, but the operations were on a small scale, and no record exists earlier than 1850. They have been the most productive quicksilver mines in the world, excepting only the mine of Almaden in Spain. They are developed to a depth of 2500 feet, and the workings extend horizontally over a piece of ground one mile square. About 350 men find steady employment, the work being actively prosecuted throughout the year. From the 1st of January, 1864, to the 31st of December, 1892, the number of feet of drifting and sinking in the mines of the company, as shown by the records, amounted to 262,270 feet, or 49 67-100 miles, at a cost of \$2,221,337.71. This does not include the excavations made in extracting ore during the period named, nor any expense for the same, while for the ground opened up during the previous period (1850 to 1864) 15 more miles of drifting and sinking can be added.

The reduction works consist of eight furnaces, and include the most improved methods for working quicksilver ores, and may be considered as the most complete and perfect in that respect in the world.

Mr. James Butterworth Randol was the manager and sole representative of the Quicksilver Mining Company in California for twenty-one years, which position he resigned on the 6th of March, 1892. During his administration 389,122 flasks of quicksilver were produced, and sold at an average of \$36.32 per flask; from this and rentals, etc., \$14,939,055.41 were received, and the disbursements were: for pay rolls, \$6,703,628.66; materials and supplies, \$2,125,628.49; miscellaneous expenses and taxes, \$936,793.64; a total of \$9,766,050.79, leaving a profit balance of \$5,173,004.62.

A record has been kept since July, 1850, and from this mine alone 919,698 flasks of quicksilver were produced from 1,418,450,840 pounds of ore, of an average percentage of 4.96. Including 10,571 flasks from the Enriquita mine, the total product of all the mines on the company's property for forty years and three months (483 months) has been 930,269 flasks of 76½ pounds each, or 71,165,578 pounds, or 35,582 tons of quicksilver.

It will be noticed that during Mr. Randol's administration (21 years) the mine produced 389,122 flasks of mercury, and from this and rentals \$14,939,055 were received. But this is only 21 years of the 40, and only accounts for 389,122 of the 930,269 flasks. What the receipts were from the other 540,147 flasks has not been made public, or is not of record.

The world's production of quicksilver in 1880 was 122,536 flasks, of which California mines produced nearly one-half, which with a total production of 113,842 flasks in 1889, California only claimed 23.25 per cent. The percentage is still less this year, and the export trade has fallen off materially also. New utilizations of the metal have not been discovered and the general depression in the Comstock mines has had a bad effect on the California quicksilver mines. Between 1880 and 1889, 50 mills in the Comstock region were working 1,268,083 tons of ore, used 2,498,258 pounds of quicksilver or 1.79 pounds per ton of ore. Comparatively few mills are working now and much less ore is being treated.

We have considered in this article only the principal one of the California quicksilver mines, but there are many more mines, some of them producing largely. The record of this one mine, however, is of great interest as showing the nature of the quicksilver mining industry in this State. California is usually looked upon as a gold-

producing region only, and its quicksilver mining interests are seldom considered or referred to in its statistics of mining products. Yet it is the only State in the Union producing quicksilver, except Oregon, from which a small amount comes. We are indebted to Mr. Robert R. Bulmore of the New Almeda mine, and Mr. J. B. Randol of this city, for the statistics given in this article.

Foundry Notes.

Contracts were awarded this week by the city trustees of Vallejo, Solano county, for the pipe and the tunnel work for the new Vallejo Water Works system. Several San Francisco firms were bidders and the competition was close. The tunnel on the line is to be 1905 feet long, and the contract for it was awarded to Phillips & Searls for the sum of \$10,560. Wehner & Farrel of San Jose also bid on this work and claim that the bid accepted was higher than theirs, the award being based on a mathematical error. The San Francisco Bridge Co. bid \$10,000 for this same work, but inserted a clause in their bid that they would not take the tunnel unless their bid for pipe was also accepted. The Bridge Co. withdrew this exception, finally, and offered to take the contract for \$10,000, but the trustees refused to entertain any bids with "strings" attached, and thus awarded the contract to Phillips & Searls for \$560 more than the San Francisco Bridge Co. asked.

As to pipe, section 1 for 12-inch riveted pipe amounting to 20,430 feet was awarded to W. W. Montague & Co., of San Francisco, for \$18,560, theirs being the lowest bid on the section.

Section 2 of 42,923 feet of 8-inch lap-welded pipe and section 3 of 11,493 feet of 10-inch lap-welded pipe was awarded to Riffe & Hinkle, contractors, of Portland, Or., for \$43,250.92. Before this award was made there was considerable discussion. The Risdon Iron Works of San Francisco, whose bids for sections 2 and 3 was for Mattheson joint lap-welded pipe, claimed as they were the lowest bidder on that class of pipe, the board had decided to adopt, the contract should be awarded them. Trustees Frey and McCauley claimed that Riffe & Hinkle, of Portland, Oregon, were lower than the Risdon Iron Works on the section named. The discussion that followed shows that these gentlemen had intentionally ignored the freight reduction clause in the Risdon bid, and as some members of the board appeared not to fully know the circumstances under which this clause had been inserted, the representatives of the Risdon Iron Works asked permission to make a statement. His statement was in substance: "On the evening the board received these bids and after the Risdon bid had been handed to the Water Committee and by them locked up in this safe, but prior to the expiration of the time for accepting bids, he asked Mr. Browne of the Water Committee if it would be in order for him to insert a freight reduction clause [in the Risdon Iron Works bid] that would enable the board to make a large saving in the cost of pipe. After conferring with Mr. Frey, who also gave his consent, the bid was withdrawn, the clause inserted, bid sealed, and returned to the committee, Mr. Frey remarking that 'we want to consider everything that will make a saving to the city.'"

Mr. Frey denied that he had assented to this and there was considerable wrangling over the matter. The contest for the contract was wholly between the Risdon Iron Works and the firm of Riffe & Hinkle. The last-named firm took exception to that part of this Risdon's bid on the matter of freight, claiming it specified nothing; and had no right to be considered. They claimed that they were the lowest bidders, and were entitled to the contract. The bid accepted was for \$43,250.92. The Risdon Iron Works bid was \$41,617.62, less the difference between all-rail freight and freight by steamer, approximated at \$2000, or \$42,617.62, equal to \$633.30 less than the successful bidder on the facts of things. The board, in coming to its conclusion as to who was the lowest bidder, by a vote of 4 to 3, refused to consider the approximated sum of \$2000 as a specific part of the Risdon's bid, and on that ground awarded the contract to Riffe & Hinkle.

Thus, on both this tunnel and the pipe work of sections 2 and 3, there were contractors who bid lower than those who received the awards, as explained. The pipe will all come from the East. The contracts for the distributing system in the city are shortly to be let.

The Thompson-Houston Electric Company has filed a replevin suit against the San Francisco and San Mateo Railroad Company to recover possession of electrical machinery and appliances furnished, to the amount of \$100,000, sold under a stipulation that the ownership of the property was not to pass from the Thompson-Houston Company until the full purchase price should be paid. The supply company now demands payment, or the return to them of the material furnished the railroad.

At the meeting of the directors of the Idaho mine, of Grass Valley, on Monday, Edward Coleman resigned as superintendent of the mine. He has been superintendent since 1865. The mine has produced \$11,500,000 in gold and has paid \$4,500,000 in dividends. Eugene Creller, for years the amalgamator at the mine, was elected superintendent. Mr. Coleman goes East, but will make his home in San Francisco. The directors declared dividend No. 273, the amount being \$3 per share.

A BIGH deposit of cinnabar ore is reported opposite the old Napa Consolidated mine, just across James creek, ten miles from Middletown, in Napa county. The discovery was made by H. Fraser, G. A. Sairy, J. B. Jamieson and H. Shore, four old miners, who have been at work some time. On Saturday they found their ore to contain ten per cent of quicksilver.

Coast Industrial Notes.

The cost of operating the municipal electric light plant at Alameda, for the three months ending March 31 was \$2517.87.

As soon as the weather will permit, work will be commenced on the electric railroad between Nevada City and Marysville.

The board of officers to examine into the needs and requirements of the Mare Island navy-yard, consisting of Captain Mathews, Chief Engineer Farmer and Naval Constructor Taylor, will convene about the 12th of the month.

There are at the present time six beet sugar plants in this United States, three of which are in California, two in Nebraska and one in Utah. The three California factories turned out during the season of 1892 fully 23,000,000 pounds.

The new jute mill at San Quentin is nearly finished, and within six weeks 800 convicts will be at work turning out jute bags from the largest jute factory in the world. The new mill doubles the capacity of the prison plant, and this means a possible output of from five to six million bags a year.

Some Portland, Oregon, men intend to organize a company to can turtles at Magdalena bay, Lower California. Mr. Allen M. Barry stated that if his company was incorporated it would be located in San Francisco, as it would be more convenient to have the goods shipped to this city than to Portland, Or.

The butter shipments from Humboldt county last year amounted to 1,936,000 pounds, this amount including keg, pickled roll, etc. From present indications the shipments for this year 1893 will be far in excess of this amount. As yet the creameries have done practically nothing in the way of shipping cheese.

The Treasury Department has notified the Collector of Customs at San Francisco that on the exportation of dynamite manufactured by the Giant Powder Company of San Francisco from imported glycerine and other materials a drawback bill will be allowed equal in amount to the duty paid on the glycerins used in the manufacture, less the legal deduction of 1 per cent.

The schooner Ozar, which sailed this week for Mazatlan, Mexico, with a general cargo, is a veritable floating magazine, having on board 50,000 pounds of dynamite and 1000 cases of gunpowder, consigned to a Mexican firm. The exports of ammunition to Mexico in the past three months have been unusually large. It is generally understood that it is intended for transshipment to some one or two Central American republics.

At the last regular monthly meeting of the International Brotherhood of Steam Boilermakers and Iron-Ship Builders of the United States and Canada the following officers were selected for the ensuing year: President, O. J. Gilhert; vice-president, Fred Murphy; recording secretary, M. J. Bird; financial secretary, John Connors; corresponding secretary, M. B. Sullivan; treasurer, Hugh McAvoy; marshal, Harry Boucher; board of trustees—William Shandley, Charles Tracey, John Norris.

TRACKING for the new electric road on Mission street has been completed from the Chiua-avenue terminus at the Five-mile House for nearly a mile to a point some 200 feet below St. Mary's College. Ground has been broken and plowed half a mile farther in, and is ready to receive ties and rails. The new railroad is being solidly built, and a good foundation of finely crushed and rolled macadam is being laid. Rapid work is being done by the Pacific Improvement Company, which has the contract to lay the roadbed, but two weeks having elapsed since the commencement of rail laying. In that time over a mile has been laid with rails.

The Los Angeles, Owen's Valley and Utah railroad is projected to begin at Bishop's creek, about twenty miles north of Independence, Inyo county, and ten miles from the upper end of the canal. The line will pass through Independence, Lone Pine, Olancho, Rose Springs valley and Indian Wells valley. Thence it will bear to the west, and end at Mojave, the total length being 140 miles. Engineers are now making the survey, and securing the rights of way. Little grading is required. Work will be pushed, and it is intended to extend the line eventually southerly into Los Angeles and northerly into Utah. An English company is to build the road.

INFORMATION has reached this city to the effect that by an agreement entered into between the rubber manufacturers of the East there will be an increase in the price of rubber goods. It is said that the increase in the price to the jobber by the new list and terms is 25 to 33 per cent. This will cause an advance in rubber boots of about \$1.50 to \$1.75 a pair, and of 25 to 30 cents on overshoes. The manufacturers will have their headquarters in Boston. It was expected that the compact would be effected before the winter set in, but some factories held out too long. There are a few manufacturers though who have not joined the combine, but they exact the same terms as those in the compact.

THERE are about 250 lathers in San Francisco and they are unsatisfied with the wages. It is claimed by the lathers that for two years they have been at the mercy of the plasterers, who have systematically reduced wages, until it is impossible to make half the money which was formerly paid for work. An expert lather will put on from 2,000 to 2,400 laths in a day, and when they were paid by the piece, it was at the rate of \$2.50 per thousand. But of late the highest wages have not been above \$2 per day. It is understood that they propose classifying lathers in three grades, which shall receive respectively \$2.50, \$3 and \$3.50 per day, and that all work on which members of the union are employed shall be abandoned until the increased demands are met by the bosses.

THE city council of Santa Rosa adopted an ordinance calling an election May 9th for the purpose of voting \$165,000 in bonds for the construction of a new system of water works. A few days ago the council asked Colonel Mark

L. McDonald, president and principal owner of the Santa Rosa Waterworks Company, to make a proposition for the sale of the present system. He complied with the request, offering to sell his system to the city for \$210,000. As the last sworn statement of the company valued the works at about \$153,000 the council declined the proposition. This system to be adopted, should the bonds carry, is the Wagner steam-wheel system, and it will be put in by the National Water Supply Company of Cincinnati, O.

J. M. ASHTON, General Western Attorney for this Northern Pacific Railroad, with headquarters at Tacoma, is at the Palace. Mr. Ashton said it had been very dull in Washington for two years past, but lately there has been much improvement. The greatest progress of this past year has been at Everett, where a town of almost 6000 has been built up in a little more than that time, and where extensive manufactories employing thousands of men have been established. Spokane is reasonably active, and it is quiet at both Seattle and Tacoma, but the outlook for the latter cities is especially promising. The lumber interest is dull, so Mr. Ashton states, but lately purchasers from Wisconsin and Michigan have been arriving, and this with an increased activity in mining near Mount Tacoma and Monte Cristo and other districts, has put the new State on a much healthier basis.

THE steamer Rosalie, built at Oakland for bay excursions had a successful trial trip a few days since. She is 146 feet long, 17 broad and 10 deep. Her engines are 600 horse-power and capable of propelling the little craft at the rate of sixteen knots an hour. Her net tonnage is 500. The woodwork in the cabin is of native sycamore, beautifully polished. Soft terra-cotta mosaics cover the floors. The ceiling is covered with a cream-colored paper. The large aftercabin, directly beneath the main saloon, is finished as handsomely as the saloon. The bar forward is a feature of the steamer. The floor is covered with the finest of English linoleum and the heavy beams are tinted in cream. The smoking-room on deck is furnished in keeping with the rest of the vessel. Electric lights are used throughout. The Rosalie is one of the handsomest steamers ever built on this bay.

THERE is trouble of a serious nature between the members of the American Fishing Union, which comprises the men who go out to sea in small boats on the one hand and the owners of steam fishing boats and the heavy dealers on the other. For some time the former have complained that they were not being dealt with fairly, and as a last resort, so they say, they decided to ignore the middle men and engage in business on their own account. Accordingly they banded together and opened a market of their own on Merchant street in a building formerly occupied by a firm of pork-packers, but which is newly fitted up. The new venture is simply a move on the part of the fishermen to benefit themselves and the public at the same time. In the past the middle men have not acted fairly either way, but have taken every opportunity to carry things with a high hand. By combining they compelled the men who catch their fish to sell at ruinous prices, and then would force the public to pay whatever was demanded. The result was an enormous waste, which it is proposed to do away with.

SANTA MONICA has been declared an open port, ready to do shipping business with any part of the world. The ship County of Antrim sailed from London, England, January 18th, with 10,000 barrels of cement, consigned to Balfour, Guthrie & Co., clearing for San Pedro. On March 8th John M. Crawley, assistant general passenger and freight agent of the Southern Pacific Company, on behalf of Balfour, Guthrie & Co., made application to the Collector of Customs for permission to discharge the cargo of the County of Antrim at Santa Monica. The Collector referred the matter to the Secretary of the Treasury at Washington. A telegram was received by Collector Osborne from the Treasury Department, not only granting permission to the County of Antrim to discharge at Santa Monica, but extending the privileges to all vessels containing bulky goods, under the provisions of section 29, Act of Congress, approved June 25, 1884. This is a very important concession to Santa Monica, and while not conferring upon it the full dignity of a sub-port of entry, to all practical purposes it places it on an equality with any other port in legal facilities for the discharge of bulky cargo from foreign ports.

A NEW MARKET has been developed for the San Francisco merchants by the operation of the Oregon Pacific, Willamette Valley and Coast Railroad Company. For a long time the merchants of this city have had their business cut into by the encroachment of northern and southern railroad lines, but since a line of steamships to Yaquina bay, Or., and a railroad into Willamette valley, connecting with the Oregon route of the Southern Pacific Company, has been established, a large new field has been opened. While the San Francisco merchants have not fully realized the importance of the traffic, the business men of Portland have become quite exercised over it and are trying to get the Union Pacific and the Southern Pacific roads to make rates so as to compete with the new plan of the Oregon Pacific, Willamette Valley and Coast Railroad Company. This company has a lower rate from and to this city from the fertile Willamette valley by their railroad and steamship line. A meeting of the Merchants' Transportation Bureau was held in the Chamber of Commerce at Portland on March 20th to take steps to prevent the San Francisco merchants from entering into what they consider their territory, but this new railroad and steamship line is determined to meet any rate they can make in order that the San Francisco merchants may have a good chance to compete for the business of the Willamette valley and adjacent country. The steamship Willamette Valley leaves this port every few days, connecting with the Oregon Pacific Railroad to Corvallis and Albany. Here a further connection is made by river steamers to Portland by the same line, which gives an entrance into the eastern portions of Oregon and Washington. By a connection with the Oregon route merchandise is carried as far south as Ashland.

Money.

SAN FRANCISCO, April 3, 1893.

TO THE EDITOR:—Money is anything which has the quality of legal tender in payment of debt, and, in this point of view, we easily distinguish two kinds of money; firstly, coin of which the material is commercially equal to the amount of service which the coin represents; secondly, paper notes, intrinsically worth nothing. Our gold coin is an example of the first, barring the cost of coinage, and our greenback illustrates the second, barring the commercial value of the paper, which is insignificant. There is also an intermediate class consisting of coin having a more or less considerable intrinsic value, but materially less than the face value. In this position is our present silver coin, also our five-cent nickel and copper cent.

A gold eagle is in itself the guarantee of a return of the amount of service given for it; but a greenback is only the promise of such return. The silver dollar, with a present intrinsic value of about 63 cents, varying from day to day, is to that extent a guarantee and, as it is redeemable in gold, it is a promise to the extent of 37 cents, more or less. The nickel and copper coins are intrinsically worth far less than the face value, and there is no promise of redemption; but these are legal tender only in small amounts and, as they can be paid to the Government for postal service, and are not used in considerable transactions, their lack of intrinsic value is tolerated.

The value of the promise depends on the good faith and responsibility of the party making it, and, when confidence in either is impaired, such money suffers a discount to an extent which balances the fear of loss by the hope of gain. The discount on a legal tender promise may be disguised as a premium on good coin; this was the case with our greenbacks during the rebellion, or it may take the form of high prices and large wages, giving the illusion of good times, to be followed by a general collapse probably. Understanding these things, it is easy to perceive how an "inflated currency" of paper money may lead to widespread disaster by the failure to fulfill its promise. History records several instances of the kind. Our legal tender silver dollar would now be suffering the one or the other of these forms of discount were it not backed by the good faith and gold of a government in which we have confidence.

The public mind is full of fallacies on the subject of money; this is shown by such common sayings as "money makes the mare go," and "money makes money." Money does nothing. Labor and intelligence make money and all good things that we have, except such as are the free gift of nature, as land, air, water, etc. Money is neither a motor nor a creator, it is simply an instrument. I might say it is a lubricant, but all imagery is vain in treating of practical matters. It is well enough for a poet to say: "Her neck is like the swan," that may convey a very lucid idea to the enamored swain, though it is rank nonsense in fact. No woman's neck was ever like a swan, nor even like a swan's neck, and when we think about money as an adjunct of the social system, it is better to realize its true character than to invest it with imaginary qualities. Money is simply a convenient instrument, by the use of which we may exchange services without the necessity of finding the person who may happen to be prepared to render the precise kind of service which we may require in return for ours. For instance: I want a pair of trousers and I propose to pay for them by shoveling coal; but the tailor may not want coal shoveled, while the hotel-keeper may, so I shovel coal for the hotel man, he pays me money and I give that money to the tailor in exchange for a pair of trousers, and so on.

Another popular delusion is that the free spending of money condones its unjust acquisition. Thus, an English lord who derives a large income from his estate—that is, from the toil of others to whom he makes no return—is looked on as a benefactor if he employs many people to do nothing useful, and almost a saint if he also gives to useful workers an opportunity to earn over again a part of that which they or their fellows have already earned and given to him, under compulsion, for nothing. The one kind of lord whom Washington & Co. forgot to abolish—the very cream and essence of lordism, the *landlord*—may also be a good and useful citizen, but, as a *landlord*, he is a pauper, fed and clothed by other's toil, absolutely useless, and more burdensome than a dozen inmates of the poorhouse.

Counterpart to the above fallacy is the common idea that the rich man who does not spend his money is keeping it out of circulation, the truth being that few rich men keep large sums in hand. They usually deposit in a bank or—often if not in active business—buy bonds and other *promises* (called securities in financial slang), so that the money does actually circulate.

Many enthusiasts have thought, because they did not think enough, that intrinsic value of money might be dispensed with. They have imagined that it would suffice if the Government should issue paper money, not even pretending to redeem it ever, which, circulating from hand to hand, would answer every purpose. We are not civilized enough for that yet. We cannot trust our Governments quite so far, and all such experiments have brought disaster.

Yet I see no reason why we must be perpetually digging up gold and silver for money. Admitting the necessity for a metallic basis for the currency, why not make a given quantity of precious metal serve indefinitely, at least for use in our own country? Let the Government buy metal, pay for it with legal tender notes, coin it or cast it as ingots and keep it. We might require a billion or more dollars; what matter? The notes would pass at par; some of them would be lost by fire and other accidents, but that happens under the present system, to the great profit of bankers. At stated intervals let the notes be called in and replaced by a new issue; the lost notes would thus inure to the benefit of the Government—that is, of the

community instead of the bankers. The same gold would serve perpetually as the basis of the currency; it would not be worn away nor "sweated" as coin is now, nor lost utterly by shipwreck. The notes should be redeemable only on the demand of the nation.

For paying foreign countries, should we be foolish enough to buy more than we sell to them, which is quite needless, we might dig some more gold from the ground, but I fancy such notes would soon pass all over the civilized world. The saving of wear and tear of coin and pockets, of the cost of continual coinage and recoinage, the avoidance of absolute loss, since private losses by fire, etc., would all fall into the government, and the saving in labor and expense of transportation, would far more than compensate the cost of the notes. As a bulwark of safety to the government this plan would be vastly superior to a national debt, and it would impose no burden of taxation on the people as a debt does. In case of great emergency, as war, a special issue, similar to that of greenbacks could be made, to be replaced in due time by the gold notes as they should be gathered in as revenue, or otherwise paid. Of course there would be danger of counterfeiting, but we have that now, and I suspect it is as easy to counterfeit coin as notes. In this connection, I am surprised that some enterprising persons should not he (perhaps they are) making *genuine* standard silver dollars, absolutely equal and similar to the government dollar, at a profit of 30 per cent. It might be done in a foreign country, or on some remote island or mountain.

I propose to make a few remarks on the double standard next. C. H. AARON.

Jetty Harbors of the Pacific Coast.

At the last meeting of the American Society of Civil Engineers, Capt. Thos. W. Symons, U. S. Engineers, submitted a paper on the above subject. The Pacific Coast is generally high and rocky, and has few good harbors. The shore is formed largely of sands easily moved. From the southern limit of California to the northern limit of Washington, the length of shore line is 3120 miles, of which California possesses 1097; Oregon, 285, and Washington, 1738 miles, the latter including that of the islands in Washington and Puget Sounds. The slope of the ocean bottom near the land is about four fathoms per mile. On the Washington coast 100 fathoms depth is reached at about 20 miles from shore; on the Oregon coast at 10 miles, and along California at 6 miles. A depth of 1500 fathoms is reached at about 60 miles from shore, giving an average slope of 25 fathoms per mile.

The main ocean current off the coast is from the northwest, producing a reflex eddy current to the northward along the coast. Along some parts of the coast, but not all, this is continuous throughout the year. The prevailing summer winds are from the north and northwest, and the severe winter winds from the south and southwest. These cause currents near the shore in the same direction, extending seaward 16 to 50 miles, of 1 to 1½ miles per hour. The tides increase in range from 3.7 feet at San Diego, in the south, to 6.2 feet at the mouth of the Columbia. At the head of Budd's Inlet the range of tides reaches 18 to 20 feet.

The marked peculiarity of these tides is that in each lunar day there are two high and two low waters which are generally unequal in height and different in interval. They are called "lower low," "higher low," etc. From lower low the tide rises to the lower of the two high waters, then falls to a higher low water, rises to a higher high water, and then falls to the lower low water. Sometimes there is little difference between the "lower high" and "higher low," or practically no change for hours. The datum plane is a mean of the "lower low," and is about one foot below that of mean low water.

The rock along the coast is mostly sandstone, that in the projecting points being the harder. In addition to this source of sand, the coast range of mountains at about 20 miles from shore consists mostly of soft sandstone. The visible sand along the coast consists of dunes entirely destitute of vegetation; of others covered with driftwood, upon which a feeble growth exists, and large areas are exposed at low tide. A careful study of the movement of the sands must be made in every locality where improvements are projected. In some places, as at Coos bay, for example, the sand moves in a cycle, being first washed up on the spit, then dried and carried by the winds into the bay. The tidal currents sweep it out to sea and the waves throw it back on the bar, to again begin the round. The control of this movement by plant growth, while yet experimental, bids fair to accomplish much good.

Where the sand is heavy and coarse, the scouring of a channel through a bar is slow; but, on the contrary, when once formed, it is more stable than where the sand is light. The immense forests of the interior furnish great quantities of drift material, so that the whole North Pacific Coast is lined with it. Logs four to six feet diameter and 100 feet long are found intermingled with stumps and other forest debris. At the mouth of a drift-bearing stream, special precautions have to be taken to prevent injury to works in progress. At Port Orford, in Oregon, and San Pedro, in California, harbors are proposed for deep ships to be formed by breakwaters. Jetties have been, and are, under construction at other points.

The first jetty to be constructed on the Pacific Coast was at Yaquina bay, a narrow estuary, 20 miles long, and 115 miles south of the Columbia river; its tidal area is five square miles, and its drainage area 262 square miles. The average height of tide is seven feet, and the maximum range 11 feet. The mean outflow of tide at ebb is 32,000 cubic feet per second, and the channel, carrying seven feet at low tide across the bar, was constantly shifting in position. A quarter of a mile out from the bar is a reef of rocks which broke the swell and acted as a breakwater. The depth inside was four to five fathoms. Examinations

by boring showed that the maximum depth to be expected by scour was 18 feet. The heavy waves of winter assume a motion of translation at depths of eight to ten fathoms, and carry great masses of sand shoreward.

The plan of improvement adopted was to construct two jetties 2300 feet apart at the harbor throat, and converging to 1000 feet at deep water, the north one being 3600 feet and the south one 2300 feet long. These were so located as to deflect the channel to the south of the reef. The jetties are rubble mounds reaching to high water. The south jetty was built on brush mattresses four feet thick, resting on sand, and the north one on the rockbed. A tramway was carried on a trestle, and an interesting feature was the use of a revolving pile-driver, which could drive piles 15 feet in advance. The mattresses were of brush fascines and pole-bound together, and were constructed underneath the tramway tracks and around the piles, loaded with stone and sunk. The sinking of piles in sand is now done entirely by the hydraulic method. The total cost of the jetties was about \$90 per lineal foot.

The result reached has been to double the low-water depth on the bar and maintain it in a good location; the least depth in a year has been 14 to 15 feet. Outside of the channel, against the jetties, great quantities of sand have accumulated. It was only when both jetties were completed that permanency ensued in the channel, as before the north jetty was completed the channel wandered greatly.

At the mouth of the Columbia river the work is about completed, and the largest vessels can now sail in and out easily. The bar extends in a curve convex to the sea, with its vertex four miles out. Inside, there were shoals and sand islands among which the channel ran, with a depth on the bar of 19 to 27 feet. The estimated mean tidal discharge is 1,000,000 cubic feet per second. The fresh-water discharge from the river is 90,000 feet at low water, and 600,000 when the river is high. A jetty, four and three-fourths miles long, consisting of a rubble mound built on mattresses three feet thick and 40 feet wide, was built up to low water, to concentrate the water of the river within a moderate width, and discharge it as a unit to the sea. The result has been to increase the depth at low water to 29 feet in a single channel, thus far permanent, which is 1300 feet wide; at 27 feet depth it is one mile wide. The jetty has cost \$83 per lineal foot. The jetty, while called a low-tide jetty, has really been built four feet higher, to allow for subsidence.

Other works were described, including Wilmington harbor, Cal., Coos bay, Humboldt bay and Coquille river. The paper went into details of construction, the methods of carrying on the work, the use of quoins to prevent undermining, and the relative advantages of low and high jetties, the latter being considered generally preferable.

The Marshall Nugget at the World's Fair.

CHICAGO, ILL., March 14, 1893.

TO THE EDITOR:—After a trip through southern California, basking in its heavenly climate, and drinking in its beauties, transformed to the snow and slush covered streets of Chicago, was anything but pleasant. This morning, so delightful in San Francisco, to say nothing of lovely Redlands, Riverside and Santa Anita, the air is full of driving snow, and you may believe I am glad that I can remain indoors. I can give your readers no news obtained by personal observation in regard to the fair grounds and the progress being made there for astonishing the people of the world. That the coming exposition is to be grand beyond anything imaginable, there can be no doubt.

I learn that the California Commission has assigned the glass case at the foot of the Marshall Monument, erected in the Mining Department of the California Building, to Judge W. W. Allen for the exhibit of the first nugget of gold picked up by James W. Marshall in the mill-race at Coloma, Jan. 19, 1848. It is a graceful acknowledgment to all the the world that California accords all the credit for the discovery of gold to Marshall. The exhibit will be in fine shape, and the wonder of the visitors will be that so small a chunk of gold could have wrought such wonderful results.

I will send you a detailed report after I have been to the fair grounds and seen what is being done, and I assure you I will not risk that until the weather is more like that you enjoy than it is now. R. B. AVERY.

BIDS for work on the breakwater, which has been in course of construction at San Luis Obispo harbor for four years past, were opened this week by Lieutenant Colonel W. H. H. Benyard of the corps of government engineers. The breakwater, according to the plans originally adopted, is to run out from Point St. Luis, on Whalers reef, to a length of 2400 feet. The breakwater has already been constructed 600 feet out over the reef. The bids opened were from Robert Tibbets for \$3 60 per ton for rock; Patrick O'Neill, \$2.77 per ton, and Albert Polhemus, \$1.94 per ton. Lieutenant Colonel Benyard has recommended that Polhemus be awarded the contract, and he will probably get the job. The appropriation to be used is \$28,000, which, at \$1.94 per ton, will permit the purchase and delivery of 15,000 tons of rock. It is estimated that this amount will extend the breakwater 400 feet, or a total length of 1000 feet. Mr. Polhemus is a San Diego contractor.

THE Castle Crag of Soda Creek Railroad, Shasta Co., now completed four miles, will be pushed on to Bartle on the upper McCloud, and the splendid new sawmill there which has remained idle for a year will be started up, and a big lot of sugar pine logs piled up will be slashed up at a rapid rate. The Company's mill at Castle Crag will be run to its full capacity and more power added, and perhaps a new mill will be put somewhere on the line of the railroad. The McCloud pines will soon be the scene of great stir and activity.

The Lease or Tribute System of Mining.

The following is an abstract of a paper by Benjamin B. Lawrence, Denver, Colo., presented at the Montreal meeting of the American Institute of Mining Engineers:

The lease system is the gradual result of the development of our larger producing mines throughout the State of Colorado. The operation of a mine, or group of mines, by corporations has been attended, in many cases, by disaster, owing to the difficulty of securing a day's work from the men employed in the mine, the loss entailed by careless mining and sorting of high-grade ores, and by lax or inefficient management on the part of superintendents and foremen.

Given, therefore, a mine that has been practically abandoned by its owners for the reasons given, but still possessing merit, the lessee appears on the ground and secures a lease for a year, or term of years, from the owner or owners, paying them a royalty upon the gross smelter or mill returns of the ore which he mines. In this way, many of our abandoned mines have been reopened by the miner, who, with two or more of his associates, has been enabled by careful attention to obtain profitable results.

This procedure led to the leasing of portions of a mine to different lessees, the mine still remaining under the control of the owner or owners. The lease system is now largely in force in Clear Creek and Lake counties, and, in order that its workings may be clearly understood, we will cite the instance of a well-known mine in Georgetown, Clear Creek county. This property is owned and operated by Mr. G. under the lease system, and his methods have proved so successful that his example may be followed with profit by many other mines of this description.

The lessee applies for a lease, we will say, upon a block of ground in level "C." This block of ground is the extension of drift "C" for 100 feet, which he drives at his own expense, the owner furnishing the necessary supplies, powder, fuse and candles, the lessee paying for these and for hoisting the ore and dirt and all other necessary expenses incident to the handling of the ore. The terms of the lessee are that he should drive a level 100 feet, and have the privilege of back-stopping this ground to the level above. The royalty which he pays to the owner of the property depends upon what the ground immediately behind, above and below him has yielded, if it has been opened, and varies from 25 to 33½ per cent. Should the level have been contracted for and driven by the owner, and this 100 feet of back show ore in paying quantities, the lessee pays a royalty of from 33½ to 75 per cent of the gross smelter returns.

By this method the owner develops his mine at little or no cost to himself, the lessee driving levels, sinking winzes, etc., in order that he may open stoping ground. It is evident that, under this method, the owner takes little or no risk, and is assured of profit if ore is found. The lessees are under full control of the foreman of the mine, and are subject to the same rules as would govern them if under day's pay.

By dividing a mine up into blocks of ground, varying from 50 to 100 feet in length by the distance between the levels, each lessee works his own particular block of ground, the ore being kept separate, and, when delivered on the dump, becomes the property of the lessor or owner of the mine. The ore is then shipped to the nearest sampling works and its value ascertained, the lessee paying the cost of the control sample.

The advantages of this system as applied to the mines of Clear Creek county, over the day's-pay plan, may be briefly summarized as follows:

1. The mine once opened can be operated with a small working capital.
2. The percentage of profits received from the sale of ore are absolutely net, the lessee paying all costs of mining, hauling, etc.
3. As a lessee is interested directly in the ore which he mines, he will take care that none is lost, either in the mine or in sorting it. As the ore of this district will average at least \$200 a ton, and many rich specimens are found, it also precludes the danger to all mine owners of the small speculations by employees.
4. Under the lease system the mine is not liable for lien.
5. The lessee is responsible to the owner of the mine for carelessness of any kind which may result in damage to the mine or accident to men working therein. Under day's pay the owner is responsible to his employees.
6. But little supervision of the men is necessary under ground. They will all do a day's work under the lease system, as they are working for themselves, and a man will work harder for himself than for any one else. The opportunities in a mine for shirking work are perfectly understood by both employer and employees.
7. Economy in the use of supplies of all kinds. Under day's pay a miner will use almost twice as much powder as under the lease system.
8. Miners will take great chances to find pay ore. Development will therefore cost little, as every miner working in a mine is interested in its product and the opening of new ground; he is familiar with the mine, and the owner has the benefit of his experience in finding ore, which may often baffle the keenest manager and foreman.

The system has proved an undoubted success in the leading mines of Clear Creek county, and is now being rapidly introduced into the other camps of the State, notably in Leadville and Aspen, as its working is capable of being so adjusted as to suit the character of the mine.

It is often necessary, should the mine be in poor ground, to encourage the lessee by what is known as allowance of footage, which means an allowance of, we will say, \$2 a foot to drive a drift, which, under day's pay or contract, would cost \$7 a foot, giving him the privilege of leasing the ground which he opens up. With ample working capital, given a non-productive mine which it is proposed to develop, it is advisable to open the property under contract, leasing the stoping only. The royalties, as has been

stated, which rule in Clear Creek county, vary from 25 per cent to 75 per cent of the gross mill returns.

It is the popular belief that only those mines which have failed under corporate management are worked under this system, and also that in leasing a mine you are practically "gouging" or destroying it as a workable property. This belief is entirely erroneous, as this system is now applied to some of our best producing mines, and they can be kept in as good condition under the lease system as under day's pay or other plan. The men leasing blocks of ground in this way do not obtain any more privileges than if they were employed by day's pay. The system is recommended to the careful attention of all mine operators.

Electrical Shot Firing in Mines.

Following is an abstract of a paper read before the Southwestern Branch of the National Association of Colliery Managers of Great Britain, by F. Brain:

About 150 years ago Benjamin Franklin first proposed that a spark from an electric machine should be used for firing a cartridge of gunpowder. It was not, however, until 1835 that this proposition was adopted and applied practically. Between 1835 and 1840 some very useful work was done by Sir Charles Pasly with electric exploders, in blasting the hulks of wrecked vessels on the British coast. In those days a Daniell and afterward a Grove and a Bunsen battery was used. These have subsequently given place to the Leclanche battery. In all these cases the current of electricity is of low tension, and the exploding apparatus is bulky. Recognizing the necessity of having an instrument that takes up much less space and is much lighter, electricians have devoted a good deal of attention during recent years in inventing high tension apparatus that would be easy to carry about, especially in mines and rock excavations. Most of these consist of ebonite friction plates with suitable collectors and condensers, but the latest type consists of small magneto-electric machines. The fuses used with the high and low tension currents are naturally quite different from one another. The low tension fuse consists of two copper terminals, fixed at a certain distance apart by an ebonite head and connected by a fine platinum wire. This platinum bridge is embedded in fine gunpowder or other explosive, and inclosed in a cup. The head thus prepared is inclosed in a detonating cap containing a small amount of fulminate of mercury, and this in turn is inserted in whatever explosive it is desired to fire. In the high tension fuse the bridge of fine wire is dispensed with, and in its place is used a sensitive chemical composition which explodes on the passage of the electric current through it. The high tension generator presents another advantage over the low tension apparatus, because it is much surer in its effect. A chemical battery is irregular in its action owing to polarization, and it is usually necessary to test it before each firing. This, of course is dangerous. A high tension generator is, however, almost certain in its action, and there is therefore no need to test it. A high tension apparatus, for firing one or two shots, measures 6½ in. by 5½ in. by 5½ in. and weighs 5¾ lbs.

The use of electric fuses is highly necessary in mines where there is any firedamp. During recent years many flameless explosives, such as roburite and tonite have been largely adopted in place of gunpowder in fiery mines, but the charges in most cases were at first, and in many cases still are, ignited, by the ordinary time fuse. This is really just as dangerous as if a gunpowder charge were used. An electrically ignited fuse is the only really safe exploder for a fiery mine. It is also extremely useful when several shots are to be fired simultaneously. It is also safer, because while the time fuse can hang fire, an electric fuse never does, and thus accidents cannot occur from workmen going to replace an apparently ineffective fuse.

Very great exactness is necessary in all operations connected with electric shot firing. The instructions given by the Electric Blasting Apparatus company, with its magneto-electric exploders, will therefore be of considerable interest.

Charging.—In charging a shot hole, great care should be exercised; 1st, that the electric detonator is inserted and secured in the explosive; 2d, that the fuse wires are kept straight from the explosive charge along the side of the shot holes; 3d, that the tamping used is not of a gritty or cutting nature; 4th, that the leading wires are not abraded, kinked or otherwise damaged during ramming; 5th, that the joints between the ends of the fuse wire and the ends of the firing cable are perfectly made by the copper wires being quite clean, bare and well twisted together; 6th, that the ends of the firing cable connected to the terminals of the exploder are clean, bare and firmly screwed down.

Firing.—In firing a shot great care must be exercised; 1st, that the firing cable wires are not connected to the terminals of the battery while any workman is at the face, while the shot hole is being charged, or while the fuse wires are being connected; 2d, that the operator's hands do not touch the terminals of the exploder; 3d, that the handle of the exploder is turned with a firm, quick action three or four complete revolutions and then—and not till then—while still keeping up the speed, the knob firmly pressed to fire the charge. The strength of the current mainly depends on the speed of the handle.

Faults.—1st, the constant use of the cables causes the insulation to become rubbed off and a short circuit is the result; 2d, the wires sometimes get injured in tamping; 3d, the fuses are often faulty by damp and are sometimes not adapted to the particular shot to be fired.

Connecting.—Where several fuses are being fired simultaneously, they should be connected in parallel, and not in series.

Conditions.—The form of exploders, cable, fuses, etc., depends on; 1st, the explosive used; 2d, the length of firing; 3d, the length of fuse wires; 4th, the conditions of working, whether the holes are wet or dry, whether a pit is being sunk, a heading made, or the coal face being worked.

Magnets.—With magneto-electric exploders, the magnet gradually gets weaker, and should be tested by hand or voltmeter from time to time.

Some Misconceptions Concerning Asbestos.

During the past decade the uses of asbestos have become widely extended, and consequently brought to the knowledge of the great majority of those who live within range of our industrial centers. As a result of the wide applications of this substance, and of the interest excited in the minds of many by a "stone" which may be teased out into a fluffy mass resembling silk or cotton, there has arisen a somewhat extensive literature of asbestos. This is scattered through geological, chemical, technical, and even religious publications, while there have appeared one or two not unpretentious volumes devoted entirely to this mineral. In these there are frequent statements which clearly indicate that the writers entertained serious misconceptions, and to call attention to some of these is the object of this paper.

1. There is a misconception as to the mineralogical character of asbestos, and this has arisen from the use of the name in a somewhat generic sense. Dana in his "Mineralogy" says that asbestos is a finely fibrous form of hornblende, but that much that is so called is fibrous serpentine. This statement seems to divide many of our writers into two camps, the one calling the mineral a variety of hornblende, the other proclaiming its serpentine character.

The Canadian province of Quebec produces, it is estimated about 85% of the world's supply, the balance coming principally from Italy. The products of these two countries are known the world over as asbestos, and it is not unreasonable, therefore, to ask that they be allowed to appropriate the name, even though they be of other composition than the mineral to which mineralogists originally applied the term, and that other minerals, if such there be, used for similar purposes, be otherwise designated.

The asbestos of commerce is a hydrated magnesian silicate of the same composition as ordinary serpentine rock; in other words, it is fibrous serpentine. It is curious to note, however, that the Canadian miners working continually among serpentine and nothing else have fallen upon the word hornblende, and apply it to a very coarsely fibrous and polished serpentine, such as is often met with along lines of faulting.

2. The second misconception is in reality but a special case of the first; it is to the effect that Canadian and Italian asbestos are different minerals. In the early days of the asbestos industry Italy was the only source of supply, and immediately prior to the discovery of the Canadian deposits a powerful company had been formed and had succeeded in bringing under one control the numerous small mines of the Italian district. Under the circumstances, it is not to be wondered at that the Canadian fiber found no favor in the eyes of the owners of the Italian mines. The Canadian mineral was declared to be far inferior to the Italian; the latter, it was maintained, is true asbestos, while the former is only fibrous serpentine. As a matter of fact, the two minerals are practically of the same composition, as is shown by the following results of analysis of fair samples recently made by myself: Italian—Silica, 40.30; magnesia, 43.37; ferrous oxide, .87; alumina, 2.27; water, 12.72; total, 100.53. Canadian—Silica, 40.57; magnesia, 41.50; ferrous oxide, 2.81; alumina, .90; water, 13.55; total, 99.33.

Canadian asbestos has largely displaced the Italian, not because of difference in composition, but by reason of the greater ease with which the former can be wrought into the various forms required in the arts.

3. The third misconception is that asbestos is in nowise affected by heat. This is set forth in such statements as "temperatures of 2000° to 3000° are easily withstood," and "a mineral which has been successfully exposed to a heat of 4500° to 5000° Fahr." Now, what are the facts of the case? It is true that asbestos is infusible except at very high temperatures, but it is equally true that only a very moderate degree of heat, heating to low redness in a platinum crucible, for instance, is required to entirely destroy the flexibility of the fiber and render it so brittle that it may be crumbled between thumb and finger as readily as a piece of biscuit. In this connection, one is reminded that the ancients are said to have possessed asbestos napkins which they cleansed by means of fire, and that Charlemagne in like manner cleansed his tablecloth, to the delight of his warrior guests. It is not improbable that these statements are to a large extent mythical; certainly, if true, the articles in question were not made of asbestos, the hydrated magnesian silicate.

4. The fourth misconception is that asbestos is possessed of high non-conducting qualities. This is perhaps the gravest and most widely spread of the several misconceptions, and is held by many who should know better. As an example of the manner in which this last misconception is set forth I may cite the following from an address of a well-known geologist: "Among the most important properties of asbestos is that of non-conductivity or its power of resisting the action of heat." Here we have the misconception clearly stated; it is that because asbestos is infusible it must of necessity be a good non-conductor. The truth is that asbestos itself is a very poor non-conductor, as any one may prove by placing a vessel of water on a sheet of asbestos cardboard and applying heat from below, or, more simply still, by placing a piece of wood on a sheet of asbestos millboard on a hot stove. If, however, asbestos is teased out and worked into a fluffy mass, we then obtain a non-conducting material, but it is the air inclosed by the fibers that is the real non-conductor, the asbestos serving simply to entangle the air. The use of asbestos in the manufacture of non-conducting coverings for boilers, etc., is due to its fibrous texture and its infusibility. The latter property gives it a decided advantage over hair and other fibrous materials which char under continued exposure to heat, while the exceeding flexibility of its fibers gives it a like decided advantage over mineral wool and other fibrous but brittle mineral substances.

The removal of the misconceptions to which attention has been called will in no respect tend to decrease the uses

of asbestos, for the mineral has a sufficiency of good quality of its own to maintain and increase the demand; while, on the other hand, a true conception of its nature and properties will prevent its use under conditions where only disappointment can follow; a circumstance which in the end would tend to bring discredit upon a most valuable mineral.—J. T. Donald in *Engineering and Mining Journal*.

The Trotter.

The odium that once justly or unjustly attached to the trotting horse breeding industry has, under the modern influences which have surrounded it, and by reason of a greater public interest and, consequently, a better acquaintanceship, so entirely disappeared as to be now little more than a memory. The terms, "fast horses," "horse racing," etc., were practical synonyms for loose morals, gambling and general wickedness. In those old days the goody-good moralists were absolutely certain that the trotting horse and his master were under the direct management of his satanic majesty, who, it was believed, made no other use of them than to contaminate the good morals of the children of earth. The race track was the devil's favorite playground. Much of this was the result of the densest ignorance on the part of the pharisaical critics, who were so blinded by prejudice and the bias of early and faulty training that they were unable to distinguish the good things from the greater of lesser that was undoubtedly connected with the industry. But step by step the bad has been compelled to give place to the higher and better, until now, while not pretending it is absolutely free from corruption any more than any other commercial industry, we present the light harness-horse breeding industry to the world as being strictly moral, legitimate and high-toned, and last, but not least, profitable. Men can make evil of anything, but the light harness-horse industry has called to its support, and is calling, such a class of men as make it probable that in the aggregate no other branch of commercial activity is represented in morals, intelligence and enterprise in a more satisfactory manner than it. Such has been the revolution of feeling in this direction that judges of our supreme courts, members of the national senate, members of the cabinet, scholars, statesmen and capitalists form a very considerable portion of its active membership. Ministers of the gospel as a class, are well represented, and it is no longer a rare thing to see a horse paper ornamenting a preacher's study table. They do not propose letting the devil have all the good things. All this is highly pleasing, and matter for sincere congratulation; but the good is not complete. Like every other business, there are certain wrongs and evils which must be daily combated and righted to insure the desired ends, and as the ultimate life and success of this broad industry rests almost entirely in the proportion of strict right and business principles upon which it is as a business conducted, the search-light need to be turned into the sulky, into the judges' stand, into the sale ring, upon the pedigree-maker and the pool-box, and the legend, "Drop a sum of money in the slot and see the light go out," must be taken down at once; the signs point to this end. It is now a rare thing to meet a breeder who misrepresents his stock; on the contrary, it is the rule for the purchaser to be agreeably disappointed. This is wise and means that the breeders and turfmen are rapidly focusing to a point where the platform shall be "an honorable business, honestly conducted."—Clark's Horse Review.

The Value of Trade Journals.

The trouble with a great many advertisers in trade journals is that they expect too much. They expect the advertisement to do more work than their best travelers, whose expenses are as much in one week as the yearly cost of the advertisement. As a rule, no attention by the advertiser is given to the advertisement except perhaps a change of wording once in six months. Speak to your customers through it the same as your traveler would talk to them, and you will soon discover that the trade paper is the only medium. The publisher of the best journal in existence can only sell you space and guarantee circulation among your probable buyers. He cannot guarantee that the advertisement will pay you. That rests with yourself. You must use the space to your best advantage, and last, but not least, do not give your travelers all the credit for the year's business. Another mistake is that advertisers look too much for cheap advertising. When you are sick do you look around for the cheapest doctor? Or, if you want to engage a lawyer, do you look for the low-priced and most obscure? Certainly not. The best evidence of the value of a paper as an advertising medium is its ability to secure and hold the best-paying class of advertisements.

BRITISH COAL AND METALLIFEROUS MINES IN 1892.—

A return just issued shows the number of mines at work under the Coal and Metalliferous Mines Acts in each inspection district, the number of persons employed in and about the mines, and the tonnage of mineral obtained therefrom during 12 months. In the Yorkshire and Lincolnshire district, comprising Yorkshire (exclusive of the North Riding) and Lincolnshire, 404 mines were at work under the Coal Mines Act, employing 67,804 persons underground, 14,361 above ground, and 2530 on private railways and washing and coking coal. These wrought 23,313,506 tons. In the Durham district, including the North Riding, there were 225 mines at work, employing 57,994 persons underground, 14,278 above ground, and 5015 upon private railways and washing and coking coal. The number of tons wrought was 26,892,804. Under the Metalliferous Mines Acts, in the Yorkshire (exclusive of the North Riding) and Lincolnshire district, there were 56 mines at work, employing 353 persons underground and 541 above ground. The minerals wrought amounted to 57,649 tons, and 1,138,092

tons not coming within the scope of the Acts. In the Durham and the North Riding there were 80 mines at work, employing 1349 persons underground and 1385 above ground. These wrought 97,553 tons of minerals, and 253,912 tons of minerals from open work not coming within the scope of the Acts. In the United Kingdom there were 3439 mines at work under the Coal Mines Act. These employed 536,091 persons underground, 112,359 above ground, and 19,533 upon private railways and washing and coking coal. The quantity obtained was 197,693,592 tons. Under the Metalliferous Mines Acts there were 1189 at work, employing 23,098 underground and 16,330 above ground. These obtained 4,000,397 tons of minerals, and 5,792,519 tons from open works not coming within the scope of these Acts.

The New School Law.

The following are extracts from the new school law passed by the late legislature:

The County Superintendent must apportion the school moneys to each district four times a year. Balances (where eight months' school has not been maintained) must be placed to credit of unapportioned County Fund and be reapportioned.

Districts lapse when there is an average daily attendance of five, or less than five pupils, during the whole school year.

County Superintendent has power to issue temporary certificates.

County Superintendent must approve or reject all plans for schoolhouses. Trustees must submit plans for his approval.

New school districts shall not be formed at any other time than between the first day of December and the fifth day of April.

Boundaries of a school district can be changed only between the first day of January and the fifth day of April upon petition to County Superintendent.

Schools must be opened in new districts not later than the second Monday in September, in the year in which the order for its creation was made by the Board of Supervisors, otherwise the order has no effect.

Election for School Trustees must be held on the first Friday in June.

When a School Trustee resigns, it must be in writing, and sent to County Superintendent.

Trustees must make no contracts with employees to extend beyond June 30th.

Trustees must appoint a Census Marshal on or before the first day of April.

Census Marshal must take the school census between the fifteenth and thirtieth days of April.

All orders of Trustees for books and apparatus must, in every case, be submitted to the County Superintendent for his approval before said books or apparatus shall be purchased.

The Library Fund consists of not less than five, nor more than ten, per cent of the County Fund, annually apportioned. It must not exceed \$50. Trustees must, in the month of July in each year, notify the County Superintendent what amount they desire to be apportioned for their respective districts for the year.

All of the present County Boards of Education in the State were legislated out of office, and it was made the duty of Boards of Supervisors to appoint four members at the June meeting and designate the two who are to hold two years and the two members who are to serve one year.

County Boards of Education must, at their first meeting subsequent to July 1st, annually, organize and elect a President.

County Board of Education may issue certificates of these grades, to wit:

High School certificates, valid for six years.

Primary certificates, valid for two years.

Special certificates, valid for six years.

Holders of California Life, Educational and Normal diplomas, who present their diplomas to the County Superintendent and have their names recorded in his office, are not required to file their certificates before assuming charge of a school.

No books other than those published by the State can be adopted or used as text books in the subjects of reading, orthography, English grammar, arithmetic, geography, U. S. history, physiology and civil government in the public schools. High Schools are exempt from the above requirements.

There shall be no construction to permit the adoption of any text books upon any subject covered by the State series.

There are many and various conditions upon which Educational, Life and Normal diplomas, and so forth, may be issued by County Boards, too extensive to be here enumerated.

The High School laws have been revised and amended to meet requirements of such schools. In Union High School districts, provision is made for building, levying taxes, maintaining school election and organizing of offices, admission of other districts and various other matters. County High Schools are entirely under the control and management of the County Board of Education.

All proceedings for establishment of County and High Schools, prior to passage of the present law, are validated. The Act takes effect from and after its passage.

THE United States Supreme Court has given a strict construction to the eight-hour law. Any work done on Sunday, and all work done on other days in excess of the eight-hour limit, entitles the worker to extra pay. The deficit of one day cannot be charged against the excess of another day in order to make an average of eight hours. Each day must be separately accounted for, and all work in excess of eight hours entitles the employee to extra compensation. The advocates of the eight-hour system could hardly ask for anything more to their taste than this final decision.

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, Department 10, San Francisco:

Continental Combination Can Co., S. F. Capital stock, \$300,000. Directors—George A. Moore, H. C. Hunter, A. C. Shattuck, Robert B. Bain and Robert B. Hume.

Graltney Hardware and Implement Co., Escondido, San Diego county. Capital stock, \$15,000. Directors—H. C. Graltney, George T. Hawley, George M. Hawley, H. G. Myers and H. S. Cliff.

American Colony, Canal and Irrigation Co., Easton, Fresno county. Capital stock, \$28,800. Directors—Robert Smith, E. M. Still, George T. Wright, James McChirry and F. C. Shumarel.

Gladyata Water Co., Redlands, San Bernardino county. Capital stock, \$50,000. Directors—E. G. Judson, R. J. Waters, A. E. Sterling, R. E. Archer and C. E. Fish.

American Invention Improvement Co., S. F. Capital stock, \$1,000,000. Directors—J. K. Bigelow, L. M. Bigelow, E. Gardner, D. M. Curtiss and C. E. Gunn.

Modesto Warehouse Co., Modesto, Stanislaus county. Capital stock, \$50,000. Directors—A. L. Cressey, F. A. Cressey, J. R. Broughton, H. P. Weyer and C. M. Maze.

The Mokelumne Water Co., Lodi, San Joaquin county. Capital stock, \$50,000. Directors—J. R. Bothwell, C. F. Copeland, F. S. Chadbourne, T. W. Newell and S. D. Woods.

San Francisco Wine and Liquor Co., S. F. Capital stock, \$20,000. Directors—I. S. Rosenbaum, S. H. Rosenbaum, Henry Falkenstein, R. H. Putzman and Helen Rosenbaum.

Madera Electric Light Co., Madera, Fresno county. Capital stock, \$100,000. Directors—D. M. Tomblin, Sol. Lazare, R. L. Hargrave, O. B. Gannyard and J. E. Newman.

Montecito Creek Water Co., Santa Barbara. Capital stock, \$25,000. Directors—E. H. Sawyer, E. S. Sheffield, T. P. Izard, E. B. Hall and A. Magee.

Los Angeles and San Diego Steamship Co., Los Angeles. Capital stock, \$500,000. Directors—Wm. B. Arkey, A. B. Smith, Geo. N. Nolan, A. A. True and C. W. Hunt.

Saint Mary's Electric Damper and Pressure Regulator Co., S. F. Capital stock, \$4,000,000. Directors—Joseph St. Mary, H. W. Chase, W. C. Starr, J. P. Moore and John Collier.

Needles Land and Cattle Co., Needles, San Bernardino county. Capital stock, \$50,000. Directors—T. L. Blackburn, F. Monaghan, Daniel Murphy, G. S. Briggs and George Nay.

Evans Extension Ditch Co., Visalia, Tulare county. Capital stock, \$54,400. Directors—W. H. Hammond, W. G. Penneaker, J. W. Thomas, R. E. Hyde, H. C. Ray, J. C. Ward and J. W. Fewell.

Jeffress, Mitchell, Tutt Co., Oakland. Capital stock, \$150,000. Directors—M. J. Mitchell, Geo. H. Jeffress, E. R. Tutt, J. C. Buttner and James Graham.

Alamitos Oyster Co., Long Beach, Los Angeles county. Capital stock, \$25,000. Directors—J. Bixby, J. McGarvin, A. L. Lovett, J. W. McGarvin and W. F. Sweeney.

Crescent Oil Co., Los Angeles. Capital stock, \$25,000. Directors—C. J. Hutchins, H. C. Converse, E. S. Lockwood, W. B. Nicholson and E. T. Wright.

Mohave Cattle Co. Capital stock, \$50,000. Directors—Paul Breon, Henry Lambert, Daniel Murphy, George H. Wheaton and George W. Harnold.

Indianapolis Furniture Co. Capital stock, \$100,000. Directors—Charles Wollpert, John Nightingale Jr., Hamilton Page, Ernest Roach and G. F. Ochs.

Bernhard Mattress Co. Capital stock, \$50,000. Directors—Joseph Bernhard, Samuel Bernhard, Henry Bernhard, Louis Bernhard and George W. Van Worst.

Wallowa Developing Co. Location of mines, Oregon. Capital stock, \$500,000. Directors—Scott E. King, Frank J. Lease, J. W. Pew, Francis Avery and W. H. Dinsmore.

Automatic Novelty Manufacturing Co. Capital stock, \$100,000. Directors—Fred Bangerter, John H. Greefken, Richard Derby, Richard Stevenson and John Derby.

United States Indicator Co. Capital stock, \$1,000,000. Directors—Henry G. Krasky, A. M. Loryea, A. R. Otter, G. H. Lehman and A. B. Murray.

Newfield Co. Object, the sale of machinery, implements, farm and lumber lands, etc. Capital stock, \$50,000. Directors—Aaron Newfield, Marcus Newfield, Philip Kahn, Sarah Newfield and Hannah Newfield.

George Detrick Co. Capital stock, \$50,000. Directors—Edington Detrick, Timothy J. Lyons, Edington Detrick Jr., George F. Detrick and Charles R. Detrick.

Sites Sandstone Co. Capital stock, \$500,000. Directors—David O'Neil, Charles O. Alexander, Augustus Abbott, John C. Quinn and William R. Jones.

St. George Gold Mining Co. Object, to reduce gold and silver-bearing ores in Vanderbilt district, San Bernardino county. Capital stock, \$10,000,000. Directors—James L. Flood, George R. Wells, William S. Lyle, John W. Mackay and James E. Walsh.

Gold Bar Mining Co., Vanderbilt, San Bernardino county. Capital stock, \$10,000,000. Directors—J. L. Flood, Geo. R. Wells, W. S. Lyle, J. W. Mackay and James E. Walsh.

El Rey de Oro Co., Vanderbilt, San Bernardino county. Capital stock, \$10,000,000. Directors—J. L. Flood, G. R. Wells, W. S. Lyle, J. W. Mackay and James E. Walsh.

Hoboken Gravel Mining Co. Directors—Martin Jones, Samuel L. Theller, J. S. Finch, B. W. Bates and Sylvester Gardner.

Art Brass Works. Directors—M. A. Cahn, J. W. Burtchall, P. E. Barker, A. Cahn and Joseph Naphaly. Capital stock, \$25,000.

Scott Billiard Table Company. Directors, A. E. Scott, J. W. Wright, John F. Nolan, John T. Bryne and C. H. Hirst. Capital stock, \$100,000.

AT SELBY'S last week a big bar of gold was received. It came from the Harqua Hala Bonanza and Golden Eagle Mining and Milling Company's mine in Yuma county, Ariz. The weight of the bar is 379 pounds avoirdupois and 5527 ounces Troy weight. It measured 5½x13¼ inches on top and 6½x15 inches on the bottom, and was 8 inches high. The value was \$96,169 80. This was the output of a 30-stamp mill for 54 days. The mine belongs to Hubbard & Bowers.

IN the suit of John Doe against the Waterloo Mining Company, on trial in the Los Angeles United States Court, involving title to disputed ground in mining claims at Calico, Judge Ross rendered a verdict for the plaintiff. Several suits are involved and are practically settled by this decision, in which several hundred thousand dollars in damages were claimed. The case had been contested in the courts for several years.

OSBORN'S

Prospector's Field Book & Guide
RECENTLY PUBLISHED.

The Prospector's Field Book and Guide in the Search for and the Easy Determination of Ores and other Useful Minerals. By Prof. H. S. Osborn, LL.D., author of "A Practical Manual of Minerals, Metals, and Mining." Illustrated by 44 engravings. 12mo, 175 pages. Price \$1.50, by mail, free of postage, to any address in the world.

CONTENTS.—Chapter I. Preparatory Instruction. II. Cry-tallography. III. Surveying. IV. Analyses of Ores, Wet Method, Dry Assay of Ores. V. Special Mineralogy, Gold. VI. Platinum, etc., Silver. VII. Copper and Iron. VIII. Lead and Tin. IX. Zinc, Iron, X. Mercury, Bismuth, Nickel, and Cobalt. XI. Aluminum, Antimony, Manganese, and other Minerals. XII. Precious Stones. Appendix, Correction of Weights and Measures, Prospector's Pointers, Index.

BY THE SAME AUTHOR.

A PRACTICAL MANUAL OF MINERALS,
MINES AND MINING.

Comprising suggestions as to the localities and associations of all the Useful Minerals; full descriptions of the most effective methods of both the qualitative and quantitative analyses of each of these minerals, and hints upon the various operations of mining, including architecture and construction. By Prof. H. S. Osborn, LL.D. Illustrated by 171 engravings. 8vo. 367 pages. Price \$4.50, by mail, free of postage to any address in the world.

Descriptive circulars giving the full Tables of Contents of the above books sent free to anyone who will send his address.

A New List of Leading Books on Metal Mining, Metallurgy, Mineralogy, Assaying, Chemical Analysis, Geology, etc., sent free to any one, in any part of the world, who will send his address.

Our new and revised Catalogue of Practical and Scientific Books, 88 pages, 8vo, and our other Catalogues, the whole covering every branch of Science applied to the Arts, sent free and free of postage to any one in any part of the world who will furnish us with his address.

Scientific Progress.

The Apparent Growth of Gold.

Of the many myths prevalent regarding gold, the greatest one of all is its growth. Of course there are many interesting instances where ancient worked-out galleries in mines are slowly closing up by the incrustation process, so that space long ago excavated is being filled with an accumulation resulting from the oercolation of water through the adjacent wall rock. This water has in chemical combination such minerals as iron, copper, sulphur, and the precious metals, which are deposited in the open crevice, making for a second time a mineralized body which will show by analysis the above-named and many more minerals. In fact, I have had this actual experience resultant on the examination of an old gold mine in Honduras, Central America, that had been worked some time prior to any history we have of that country. This circumstance gave to the natives the idea that gold grew, and they so expressed themselves; while it seemed in the case of one individual a transmutation idea had permeated his head, for he explained that the green carbonate of copper was undergoing a change into silver, while the silver in turn would develop into gold.

In India I found a caste of mining people who believed that gold grew in the bottom of the large lakes situated in that country. They expressed no practical reason other than fairy-tale superstitions; and even in this country there are converts to the idea. I was much amused and interested some years ago to hear an intelligent acquaintance maintain in strong and not altogether religious terms that "the stuff grew and he knew it." His experience was based on the fact that in a certain pile of tailings, resulting from the milling of heavy sulphuretted gold ores, he had treated at one time several tons with no result. Again, in three years time, he discovered by a pan test that the same pile had gold in it, whereupon he treated several tons, with the approximate result of one dollar per ton. After this last treatment he declared the tailings were barren of gold so far as he could detect by the mechanical means at hand. In order to convince him I selected an average sample, which on assay gave 2 pennyweights 20 grains gold per 2000-pound ton. This was considered not worth the working, but my friend maintained that the gold would grow again in two or three years.

True to his word, in two years he was at the pile again, and by his crude but sure method was saving one dollar per ton from the ore that would yield *nil* by his methods two years before. Again I took samples for assay, and was somewhat surprised to find that the value had increased just 50 per cent, as the result of my determination was 5 pennyweights 16 grains per ton. On investigation I found the sulphurets to be of a character readily decomposed by the elements—in fact to such an extent that, as I afterward calculated, over one-half the pile must have been decomposed or washed away, so that with the decomposition a certain rapid concentration was maintained by the action of heavy rains, and the natural advantage this particular ground offered causing the gold to remain behind while the oxides were carried away in suspension by the water. My explanation has failed to convince my friend of the pick and shovel. As the gold in the tailings has become about exhausted, his last attempt to make it pay was a failure. He remains strong in the conviction that a few years will grow it again.—Science.

Unfreezable Dynamite.

The use of dynamite in cold weather, says E. R. Watman, is attended with some difficulty, owing to the freezing of the material and its consequent liability to fail to explode when the fuse is fired. With proper methods and care the dynamite can be thawed with reasonable safety, but numerous accidents occur (more than get reported in the public press), due to carelessness in the operation and to the treacherous nature of the material, or a combination of both conditions. Dynamite will stand treatment at one time which at another time will result in explosion. An expert on explosives says that the most dangerous means of thawing cartridges are ingeniously devised by ignorant laborers; baking, boiling and toasting being favorite methods, while at a stone quarry, in one instance, an apparatus was arranged for steaming the cartridges over a pot of boiling water. In this latter case the nitro-glycerine leaked through the canvas cover and settled on the bottom of the pot, with the result that an explosion occurred,

the water acting as a tamping to the charge. The fact that small quantities of explosives containing nitro-glycerine will burn quietly and without explosion if ignited by direct contact with a flame has led to the dangerously mistaken reasoning that merely heating the explosive can produce no ill effect. If a dynamite cartridge is ignited or placed in a fire it will probably burn harmlessly away, but if placed on a stove or in an oven and gradually heated to its exploding temperature of 350° to 400° F. a violent explosion is almost certain to result, while before that point is reached the dynamite will become extremely sensitive to shock.

In England alone, from the beginning of 1872 to the beginning of 1890, there were reported 63 accidents due to improper thawing of dynamite, by which 50 lives were lost and 76 persons injured. Reference may here be made to the explosion of dynamite, December 28, 1892, in a thawing apparatus at the works for commencing the Brooklyn end of the proposed New York and Brooklyn tunnel, by which 4 persons were killed and about 20 injured. According to report the thawing was done by placing the cartridges on shelves in a chamber 6 feet square and 8 feet high, heated by a coil of steam pipes.

An unfreezable dynamite, invented by Liebert, a German, has been used to some extent in Europe, and has been favorably reported on by chemists and experts in explosives, and it would appear most advisable to test its practical efficiency in this country. The dynamite is made in the usual way, but its composition includes a chemical by which its freezing point is lowered from 40° above to 50° below 0, F., while the explosive power is slightly increased and the sensitiveness to concussion slightly decreased. This dynamite, it is claimed, is not affected by damp; it may be kept for considerable time without deteriorating or losing its special properties, and its cost is little, if at all, in excess of that of ordinary dynamite. It is patented in the United States.

The Absence of Air from the Moon.

Astronomers have long felt that the absence of air from the moon is a fact that demands some special explanation. Most of the globes in space which are known to us are encompassed by more or less copious atmospheres. Why then is the moon an exception? Why should there be a gaseous investment to the earth and to Venus, to Mars and to Jupiter, and why should the moon alone be devoid of such covering? The sun and other stars are also so very copiously endowed with gaseous surroundings that the total want of anything of the kind from the moon becomes all the more enigmatical.

At last a light has been thrown on the matter, and an explanation is now provided which is so consonant with the present state of physical knowledge, that I cannot hesitate to accept it. The absence of air from the moon is a necessary consequence of the kinetic theory of gases.

According to the principles of this theory, now generally accepted among physicists, any gas such as oxygen or hydrogen is composed of molecules which move with an extreme degree of rapidity. The molecules of hydrogen, for instance, which are the most nimble of all the gases in their movements at ordinary temperatures, dash along so fast as to travel, on the average, somewhat more than 6000 feet a second. Oxygen and nitrogen have movements which are generally much less than those of hydrogen. But it is to be noted that, in the course of their movements, individual molecules frequently attain velocities very much in excess of the average pace. This is the important point for our present purpose, for on it depends the explanation of the phenomenon of which we are in search.

It can be shown that the mass and the dimensions of the moon are such that if a body were projected upward from its surface at a pace, let us say, of half a mile a second, that body would ascend to a very considerable elevation. Ultimately, however, the attraction of the moon would overcome its outward movement, and the body would tumble back again. If, however, the initial pace were so much greater that it attained a certain critical amount of about a mile a second, then the missile, according to the laws of motion, would ascend from the surface of the moon and go on and on never to be again recalled by any power that the moon's attraction could put forth.

Let us suppose that the moon were now to be invested with a new atmosphere of oxygen or nitrogen. The molecules of these gases will, of course, be darting about with the velocities appropriate to their nature; but, generally speaking, the speeds with which they are animated remain within the limits of velocity which it is in the power of

the moon to control. But these are only the average speeds, and it will frequently happen that individual molecules will be animated by a speed equaling or exceeding the critical pace of a mile a second. If this takes place at the upper layers of the moon's atmosphere, the little molecules will take leave of the moon altogether. Other particles follow in the same fashion, and thus it happens that an atmosphere composed of such gases as these we know could not permanently abide on the moon.

On the earth we have and we retain a copious atmosphere. The reason simply is that the earth is massive enough to require that a projectile shall attain a speed of about six miles a second before it goes off and takes leave of our globe. This velocity it would seem that the molecules of oxygen and nitrogen do not generally or ever reach. Hence it is that while the earth can retain the atmosphere with which it was endowed, the moon is unable to do likewise.—Sir Robert Ball in Science.

Mechanical Progress.

Carborundum—A New Abrasive Material.

In a recent lecture of Mr. Nikola Tesla on the production of light by alternating currents of high frequency he referred to the use of a material called carborundum as the light-giving material of an incandescent lamp. The nature of this new material has just been made public by the issuance of a patent, No. 492,767, to Mr. Edward G. Acheson, of Monongahela, Pa., and it appears likely to become of no small importance in the arts.

The new material, says *Engineering News*, appears to be that extremely rare article in these days, a new chemical compound of simple form. It is, as nearly as can be determined, a compound consisting solely of carbon and silicon, one atom of each element to a molecule, so that the chemical symbol of carborundum is Si C.

Physically it is a crystalline substance, very brilliant and usually of a dark color, although the color varies with the materials used in its preparation. The crystals are irregular, resembling bort, and are usually octahedral, although other well-defined forms can be found. Some of the crystals are transparent and colorless. The crystals are extremely hard and highly refractory, withstanding for a long time, at least, the action of the blast from an oxyhydrogen blow-pipe. In fact, the material seems to be intermediate in its physical characteristics between the carbon crystal, the diamond and the silicon-oxide crystal, quartz, resembling the former, however, more than the latter.

It is good evidence of the extreme hardness of carborundum that the first use to which it was applied, and that for which the inventor originally designed it, was the cutting of diamonds. Notwithstanding the old saw of "diamond cut diamond," this material was found to do excellent work on the diamond-cutter's lap, and is the first material other than the diamond itself which has ever been successfully used for this purpose. Prejudice of the workmen, however, as well as the limited possible demand in this industry, led the Carborundum Company, which had undertaken the manufacture of the material, to work up trade in other directions. In June, 1891, the price was considerably reduced and it was brought to the attention of brass and metal workers as a substitute for emery. In June, 1892, further improvements were made in the process of manufacture, increasing the output to 25 pounds per day, and the price was reduced to \$2 to \$4 per pound, according to the quality purchased.

Since that time the material has been extensively applied in the construction of grinding wheels, which are being widely used. The Westinghouse Electric Co. alone uses several thousand wheels per month in grinding in the stoppers of its new lamps. The advantage over emery is in the much greater rapidity of grinding, which overbalances the increased cost of the material.

It may be said that further reductions in the cost of materials may be expected, so far as they will operate to increase the demand for it, as the process of manufacture is simple and the materials are inexpensive. The process in general consists of subjecting a mixture of coke with silica, or silicate of alumina and a flux of common salt, to the action of the heat of an electric furnace. This is accomplished by forming an electric arc in the midst of the mass of material. When the chemical action is completed the products are removed from the furnace and the carborundum is freed from impurities by breaking it into small pieces and washing

and drying. The different-sized crystals are then graded. The company is now building three additional furnaces, which will increase its output to about 500 pounds per day. The applications of the material for cutting and polishing glass, porcelain, steel, cast iron and other hard materials are steadily increasing, and the new discovery promises to be of great and permanent importance in the arts.

A Pound of Coal.

"The day is not far off when we will get heat and power without the intervention and assistance of fire," said Civil Engineer Marston McGrath to a St. Louis *Globe-Democrat* reporter. "The solution will come when we get electricity direct from coal without the loss of any part of the wonderful energy that there is in the fuel. I never knew fully the value of coal as a power-producer until I saw it exemplified on a recent trip across the Atlantic in the steamer *Majestic*. The vessel carried 2400 tons of coal, almost enough to give a half-bushel to every family in St. Louis, and it used up 290 tons a day to maintain a speed of about 23 miles an hour.

"This seems like an awful lot of coal, doesn't it? But the *Majestic* is a big boat, 582 feet long, and it requires an expenditure of 18,000-horse power to drive it at top speed through the water.

"Figure the thing out, though, and you will see that 1½ pounds of coal, which is less than a good handful, furnishes one-horse power for one hour, and one horse power represents the lifting to a height of one foot of 300 pounds, so that your 1½ pounds of coal lift 300 pounds one foot and sustains it for one hour.

"Or take this illustration: It would require 100,000 galley slaves rowing night and day to carry the *Majestic* at a speed of 23 miles an hour. Dividing 18,000-horse power into 100,000 galley slaves, we find that over 1½ pounds of coal represents the work for one hour of about six rowers. Of course there wouldn't be room for the placing of more than 400 oars on the *Majestic*, and 10 bushels of coal would do an equal amount of work, while the 100,000 galley slaves, if they averaged 150 pounds each, would weigh five times as much as the 1740 tons of coal required by the *Majestic* for a six days' trip."

A SUCCESSFUL TEST of a small copper model gun, tempered by the secret process of F. Aillard, of Lewis, Quebec, has, it is reported, been carried out at the Citadel, Quebec. Before firing, the gun was carefully gauged at two different points, one and two inches from the breech end of the powder chamber. In the first experiment, the gun was charged with three-fourths of an ounce of sporting powder, and wadded with a plug of paper driven well home with a mallet. After firing the charge, the gun was examined and gauged at the above-mentioned points; the diameters were unchanged. The next test was a very severe one, 1½ ounces sporting powder being used, leaving only sufficient room for a plug of paper, which, as before, was driven hard home, filling the oierce to the muzzle. This charge was fired with a piece of Bickford's fuse. On examination, after firing, it is stated, the gun showed no flaw or perceptible expansion.

NICKEL STEEL FOR BOILERS.—It has been reported that the Detroit Dry Dock Company of Detroit, Mich., intended to use nickel steel for boilers. The *Railroad Gazette* states that the company has been endeavoring to get information touching on the question of nickel steel and its uses, particularly for boiler purposes. It has canvassed the necessary ground to reach a decision in regard to its use in marine boilers, but thus far has found it very difficult to secure any reliable statistics. It has secured some prices, which have not encouraged it to consider the matter further, as the steel at present is too expensive for such use. The reason for considering the matter was a desire to decrease the weight of boilers, or with the same weight of steel as is now used, to be able to carry higher boiler pressures.

20-Stamp Mill for Sale.

In Southern California, a 20-stamp Gold Quartz Mill, with engine, boiler, self-feeders, rock-breaker, etc. As the premises are adjacent to Railroad, the mill could be conveniently removed. Can be had at low price for cash. Address "Quartz Mill," care MINING AND SCIENTIFIC PRESS, San Francisco.

Sampling Works for Sale.

The works are situated at Daggett, Cal., in the Calico Mining District, and on the side track of the Atlantic & Pacific Railroad. They contain a first-class 60-horsepower Engine and 45-horsepower Boiler with Ore-crusher and other machinery, Mill Scales, A-saying Outfit, etc., all nearly new. Also upon the premises an office building and a comfortable dwelling-house (portable). The above can be had at a bargain. Apply to JOHN H. GILLESPIE, 1914 Stockton St., San Francisco.

Metallurgy and Ores.

SELBY
SMELTING and LEAD CO.,
416 Montgomery St., San Francisco

GOLD AND SILVER REFINERY
And Assay Office.

Highest Prices Paid for Gold, Silver and
Lead Ores and Sulphurets.

—MANUFACTURERS OF—
BLUESTONE,
LEAD PIPE,
SHEET LEAD,
SHOT, Etc., Etc.

cal Mgr. and Asst. Treas.; T. L. WISWALL, Gen'l Mgr.
and Secy.; PETER MCCOY, Treas.; W. L. COOPER, Eng.

TRADE MARK.

General Office of Company:

Rooms 8, 9 & 10, Tabor Grand Opera House
Block, DENVER, COLORADO.

Also mills in operation as follows, viz: The Denver Mill,
Denver, Colo.; The Livingston Gold Mining Co., Boulder
Co., Colo.; The Puzzler Gold Mining and Milling Co.,
Boulder Co., Colo.; The Cripple Creek Gold Extraction
and Power Co., Colo.; Calumet Gold Mining Co., Middle
Creek, Shasta Co., Cal.; The Shasta Gold Ex. Co., Mid-
dle Creek, Shasta Co., Cal.; The Mercer Gold Mining
Co., Fairfield, Utah; Chumley's Mines, Humboldt Dis-
trict, Yavapai County, Ariz.; The Crowned King and
Last Chance Mine, Yavapai Co., Ariz.; The Union Mines,
Maricopa Co., Ariz.; The Revenue Con. Gold Mining Co.,
Revenue via Norris, Mont.; The Creighton Mining &
Milling Co., Creighton, Cherokee Co., Georgia; and
others in course of erection.

The object of this company is to introduce the Mac
Arthur-Forrest process

We have purchased from the Cassel Gold Extraction
Co., of Glasgow, Scotland, the exclusive right for the
United States to use patents covering this process.

If you desire an experimental test communicate with
the secretary.

If the results of the tests are favorable, we will then
make arrangements to treat a quantity of not less than
five tons at Denver.

We are fully prepared to grant royalties to mine and
mine owners, or rights covering districts and counties.

The process consists of pulverizing the ores to a fine-
ness of about 50 mesh, and then subjecting the same to
an action of a very diluted solution of cyanide. A few
tubs especially constructed according to our diagrams,
for triturating, settling and filtering, is all that is re-
quired extra in connection with any kind of pulverizing
stamp or rolls.

The total cost, as a rule, does not exceed from \$2.50
to \$5.00 per ton.

The most desirable class of ores for this process
he so-called refractory gold ores, pyrites, hematites
manganese and tellurium. We have also treated suc-
cessfully dry silver ores.

We will be pleased to answer any inquiries and fur-
nish any desired information. Address,

T. L. WISWALL,

Practical Hydraulics.

A Book for Civil Engineers, Miners, Mill-
men, Hydraulicians, Mining Engi-
neers, and Irrigators.

By P. M. RANDALL.

This new work is by one of the most experienced hy-
draulicians of the country. It abounds with useful
tables for ready reference, in which the results of ab-
struse calculations are all placed in a form so that one
can find what he wants in a moment. For the engineer
the principles, formulae, coefficients, etc., are given; and
for those not familiar with higher mathematics, ex-
amples, rules, and tables are prepared. Thus the needs
of the scientist and the practical miner or millman are
each met. It is the most complete work on the subject
yet published, and is specially applicable to the Pacific
Coast.

Table of Contents.

The following brief abstract of the contents will give
an idea of the branches of the subject treated:
General Plan; Discussion of the Principles of Hydraulics;
Rules Deduced from Formulae Obtained; Examples
and Calculations; Extensive Tables for Ready Refer-
ence; Fundamental Laws of Hydraulics Demonstrated
and Expressed in Formulae and Rules; Flow of Water
through Openings; Weir Coefficients; Triangular
Weirs; Flow of Water Over Quadrant Weir (tabulated);
Application of Tables; Submerged Orifices; Flow
Through Orifices in Thin Partitions; Tables and Appli-
cations; Miners' Inches; Tables and Calculations; Flow
of Water Through Short Tubes and Compound Tubes;
Flow of Water Through Pipes; Tables of Velocities and
Cubic Feet Flows for Given Feet per Mile and Diameters
of Pipe; Coefficient for Bend-Circular and Angular;
Flow Through Nozzles; Inverted Siphons; Flow or
Water in Open Channels; Extensive Tables; Rough and
Ready Notes; Hints for Speedy and Approximate Esti-
mates, etc.
Price, \$2.00, post-paid. Sold by DEWEY PUBLISHING
CO., Publishers, 220 Market St., San Francisco, Cal.

INVENTORS, TAKE NOTICE!
L. PETERSON. MODEL MAKER.

226 Market St., N. E. cor. Front (up stairs) San Francisco
Experimental machinery and all kinds of models. Tin,
and brasswork. All communications STRICTLY CONFIDENTIAL.

BACK FILES of the MINING AND SCIENTIFIC PRESS (un-
bound) can be had for \$3 per volume of six months. Per
year (two volumes) \$5. Inserted in Dewey's patent
holder, 50 cents additional per volume.

Useful Information.

Valuable Pacific Coast Shells

Occasionally large and valuable shipments of shells of various descriptions are made from San Francisco to Europe and elsewhere. These comprise rather an important item in our export trade. Formerly abalones received more prominence as an article of export, but they are still in good demand, being used for many purposes, both ornamental and useful. On the California and Mexican coast the *halibuts*, or abalone, shell is much sought for by the Chinese for food and bait. Large quantities of the shells are exported to China and Europe annually for the manufacture of buttons, etc. The pearls found in these shells are light green, and irregular in shape, but the luster is often very beautiful, and they have ranged in price from a few dollars to \$100 dollars each. The most valuable variety known to commerce is the Mexican. It is found clinging to cliffs, reefs and submarine rocks throughout the coast of Mexico from San Tomas, close to the American line, as far south as Acapulco. Blue-green abalones are gathered by Mestizos and brought to Wilmington (San Pedro) by traders and fishermen.

The next most desirable of seashells is the black, of California. By some this is regarded as the richest and most beautiful of all. The wholesale price of this shell has been given as high as \$1000 per ton, and it is used in the same industries as the one heretofore mentioned. The gray is common to the whole coast, and has had a market value of \$700 per ton. It is used for numberless purposes, useful and ornamental. Los Angeles is the center of this trade and Europe is the market, France being the largest buyer. The shells are stored at San Diego, San Pedro, Los Angeles and Santa Barbara, and are shipped as the trade demands. The Chinese, besides providing an unlimited market for abalone meat, which they regard as a luxury, also compete with Europe for the possession of the shells, which are used in China much as they are in Europe.

The abalone-shell trade of California long ago assumed large proportions, the annual value reaching a very respectable figure. In bringing these shells to the perfection of beauty, that determines their value, both the Chinese and European manipulation embraces four processes: First, ground upon a common grindstone; second, applied to an emery wheel; third, polished by hand with pumice stone; fourth, a secret process which gives the final polish.

Mother-of-pearl are the most valuable of all shells, and are known to the trade as the "Tahiti Shell." They are deep-water shells and are found around and off the coast of the island of Tahiti. Native divers raise them to the surface and they are brought to California by traders who procure them in barter. The Tahiti shells are marketed solely as articles of vertu, bric-a-brac and curios. In Europe they find additional use and value in the manufacture of rare and elegant articles of fancy, fashion, toilet and jewelry, and in the creation of costly and artistic island work.

Pearl oyster shells are found along the Mexican coast, and at La Paz their gathering and shipment forms quite an industry. They are used in the manufacture of pearl buttons, and the trade is confined almost exclusively to France.

The Redwood's Disappearing.

The question as to whether a redwood forest that is once cut away will renew itself is one that has occasioned much discussion among lumbermen. So far, however, as the evidence supplied by the abandoned logging woods of this county is concerned, the question must be answered in the negative. There are, adjacent to Eureka, tracts that were "logged off" more than 30 years ago, yet there is little or no new growth of timber upon them.

When redwood trees are cut, sprouts sometimes spring out from the stump and grow quite rapidly for a time, but that these sprouts seldom or never develop into large trees can be seen by examining almost any old logging claim.

Another noticeable feature about our redwoods is that groves of young trees are seldom found, and then only on the outer borders of the forest. Back in the primeval forests a young tree is seldom seen. One explanation of this is found in the fact that the redwood seldom or never propagates itself by means of its cones, as do pines, spruce, hemlock, etc. Practically speaking, all the young trees are sprouts.

Several years ago the writer, accompanied by Hubert Vischer, an agent of the State Forestry Commission, spent several days in

investigating this question of the reproduction of the redwoods, and the conclusion reached was that, practically speaking, the forests will never be reproduced. This conclusion is also in accordance with the theory of Professor Kellogg, the botanist, that our redwood forests are the remnants of a former epoch, and are the results of geological and climatic conditions that have long since passed away. If this theory be true, in another generation all that will be left to indicate the grandeur of the departed redwoods will be an occasional blackened and decaying stump, unless some provision be made to soon preserve as a park some portion of the primitive forest as a heritage to future generations.—Humboldt Times.

The Farrier's Art.

Points to be observed in shoeing a horse properly:

Twist off the old clenches, or rasp them off without touching the crust.

Gently raise the shoe in such a manner that the crust shall not be broken or spoiled.

Don't use a knife, but with a rasp make the sole quite level.

The toe must be rasped down more than at the heels, and the more you can rasp away the soles at the toes without making the sole convex, the shorter the toes will look, and bear in mind that this is the only way that the toe must be shortened.

Endeavor to keep the frog so high above the heels that when the shoe is on, it shall be about one-sixteenth of an inch above the level of the shoe.

With the rasp held at an angle, gently rasp around the edge of the crust to take off the broken edges before the shoe is applied.

The sole of the foot being a dead level and flat, and the foot side of the shoe a dead level and flat, there will be no occasion to burn the foot to make a fit.

Be careful that the shoe fits the foot all around the heels, and that the hoof does not project beyond the hoof.

In like manner the shoe must not project beyond the hoof.

See that the nails fit the holes tight.

In order that the foot may expand when placed on the ground, don't use nails far back on the inside.

Let the nail's point come out in a level line all around the foot about three-quarters of an inch above the foot side of the shoe.

The shoe having been nailed on, twist off the projecting points of the nails and turn down and hammer down the stumps to form clenches.

The rasp must not touch the foot after the shoe is on.—London Live Stock Journal.

AMERICAN SAILS.—It will be gratifying news to all Americans to learn that the British are beginning to recognize the knowing cut of American sails. Last season the two little Yankee fin keels exported from the Herreshoff yard at Bristol, R. I., had things their own way in British waters. For the first time in history, a full suit of sails for a racing 40-rater is to be sent to Great Britain. John M. Sawyer & Son, of South street, who for years have been making sails for all the crack American craft, have received the order from George L. Watson, the designer of Lord Dunraven's Valkyrie and the Prince of Wales' Britannia, to make a suit of racing sails for a boat now on the stocks. It is really an encouraging sign to see our British cousins go in for a suit of American cotton duck, in place of Scotch jute. The British "spinnaker silk," so called, perhaps, because there was not one atom of the product of the silk worm in its composition, has gone out of fashion in these waters. The climate is too trying. It can't stand our air. It has a tendency to split and blow out of the holt ropes in the slightest squall. In its stead has come into fashion a pure product of the American mills, fine as satin, strong as steel, and thus again Britain bows down to Yankee ingenuity.—N. Y. Recorder.

THE beautiful sheet of artificial ice, on which so many Parisians have skated during the present season, is the result of a careful working out of a system that proved unsuccessful some three years ago. The machinery consists of two ammonia ice machines, driven by two 50-horse power steam engines. The ice machine has pumps which force ammoniacal gas into water-cooled condensers, liquefying the gas, which then passes into large reservoirs, where it expands with the production of cold. The same gas is pumped back and used continuously. The rink is about 60 by 130 feet in size, with a floor of cork and cement, upon which is laid three miles of connected iron pipe. Through this pipe circulates a solution of chloride of calcium, an uncongealable liquid, which, by passage through

spirals in the refrigerating reservoirs, is cooled to 5 to 20 degrees below zero, according to necessity. The water over the pipe is thus kept frozen, and daily sweeping and flooding preserves the smoothness of the ice.

Electricity.

Concentric Wiring and Safety Wiring.

In the very first systems of distribution of the electric light in multiple arc, which we believe was that proposed by De Khotinsky, it was suggested to use the earth as the return circuit, but when electric lighting became a commercial industry this was abandoned and all circuits were very carefully insulated from the earth. Gradually, however, it was found that certain indisputable advantages existed in grounding the neutral wire of a three-wire system; and now the other extreme is reached by the advocates of what is called concentric wiring, who claim that great advantages, besides much greater safety arise in grounding one wire of any system, be it three-wire or two-wire. Thus, after a complete cycle, we are led back to the very first method. This system, to which a reference will be found in our digest this week, consists essentially of two conductors, one outside of the other, enveloping it completely, the outer one being grounded as thoroughly as possible; all switches, cut-outs, etc., are made of metal instead of porcelain, and are grounded. The claims made for it are not unreasonable, and it seems to us that such a system is well worth more careful consideration, notwithstanding the prejudices against it. It should not be forgotten, however, that, unless a system is grounded thoroughly at both ends and at as many points as possible, leakage currents may arise due to a difference of potential of a few volts between different parts of the wire and the earth, such currents being sufficient to do considerable mischief in corroding the wires. In a system in which such earthed currents are used, as in lighting or railway work, if grounded at all, the wires should be very thoroughly grounded not only at the two ends of that wire, but also at intermediate points; such grounds, furthermore, should be soldered contacts, as one should not trust to mere contact produced by pressure.

In connection with the system of concentric wiring, just referred to, we may be pardoned if we call attention once more to a fact which is not understood and appreciated as much as it ought to be, especially by insurance companies, who are our dictators and rulers in regard to wiring. Some of their rules say that the two wires must be kept a certain distance apart; as a matter of fact, however, it can readily be shown that the closer they are together the safer they are. This may readily be shown by nailing two bare wires on a board and moistening the wood between them; when they are two or three inches apart the leakage current will slowly set the wood on fire, and as this requires a very small current the fire may be started without blowing the safety fuse. If, on the other hand, they are close together, separated only by a thin layer of insulating material capable of absorbing moisture, the current will become so great that the fuse will be blown immediately, before any charring or ignition can take place. The experiment is such a simple one that those who do not believe this statement can readily satisfy themselves by making an actual test. In making this test it is advisable to put some salt or soda into the water. Contrary to general belief, it therefore appears to be much safer to place the wires as close together as possible, provided proper precautions are taken to prevent the accompanying flash from igniting any very inflammable material.—Electrical Review.

Electric Lamps in Omnibuses.

Some time ago, the London General Omnibus Company decided to try the experiment of introducing electric lamps into the leading routes of omnibuses owned by them, and, after negotiations, entered into an arrangement with the Bristol Electric Safety Lamp Works to supply 140 omnibuses with small incandescent lamps worked by their patent battery, according to the London *Electrician*.

The battery selected for this service weighs about eight pounds, and is placed in a wooden box under one of the seats. The box is provided with two brass spring terminals, which make automatic contact with the battery when it is let down into the box. The lamp is of a special design, and is made as shallow as possible, to allow of its being placed in the center of the roof, it being found that this arrangement distributes the light most satisfactorily all over the car-

riage. The lamp is covered by Mr. L. Bristol's patents, and offers great advantages for omnibus work, since breaking of filaments from the shaking of the carriages is avoided. Ordinary bottom loop lamps are used, and two wire hooks, which expand sideways, clasp these loops firmly. A wire spring, which catches the top of the incandescent lamp, forces it against the wire hooks and increases the clutch of the hooks.

The batteries are charged at Victoria, seven in series, from the Westminster Electric Supply Corporation's mains, small incandescent lamps being used as resistances. The batteries have, we understand, stood the test in a very satisfactory way, and the severe shaking to which they are necessarily subjected while in use has had no effect upon the plates.

The installation has been very successful, the only difficulty experienced being to get time to charge the batteries for the whole night's run, as the lamps are delivered between the hours of 9 and 12 A. M., and the serving out commences about half-past two, but a sufficient number of spare batteries now provided will overcome this difficulty.

A type of lamp and battery which is used by the ticket inspectors in the employ of the London General Omnibus Company consists of a pocket accumulator and a button-hole lamp.

Engraving by Electricity.

A discovery is announced which, if practicable, may possibly entirely revolutionize engraving by the ordinary present-day system, and particularly those of photographic processes, says *Invention*. The subject is drawn on a plate of zinc, which is covered by a layer of bitumen either by the artist or by photographic means; then it is plunged into a bath of diluted acid, when it is put into communication with a battery, one pole of which is simply placed in the acid. When the current has been set to work the acid attacks the metal very quickly, a few minutes sufficing to obtain the required depth, as it is very easy to control the current. This process is the more preferable to the present methods, as the regulation of the engraving to an exact mathematical depth is easily obtained, whereas in the method of engraving by acid baths the surface of the plate is covered with a pellicle of hydrogen, under which small air bubbles continually appear, necessitating the constant moving about of the bath and a constant brushing of the plate.

The discoverer believes that the action is due to a polarization on the surface of the metal. As we take it, the current of electricity is utilized for the production of plates, not by acting directly upon the plate itself but in the proper regulation of the current so as to give more or less action direct to the acid. It is noted in this process that if a plate of metal is plunged into a bath of acid and put into contact with one pole of the battery there are no bubbles to be seen on the parts of the metal in contact with the acid, and the etching is made much more regularly and quickly than under ordinary conditions. The obviating of these air bubbles on the surface of the metal is a very important point, because their presence results in unequal biting of the surface of the plate, both laterally and vertically, and outlines lose their effect by the clearness of the design being interfered with. It is this which causes the necessity for the use of the rocking vessel and the constant use of the brush in the ordinary methods.

A CLEVER CONTRIVANCE has been invented for the detection of small pieces of magnetizable metal, such as needles, tacks, steel and iron chips, etc., that may have entered the human body unawares and hidden themselves in the skin or deeper tissues. The instrument was devised by Dr. J. B. Williams, formerly of San Francisco, and consists essentially of a partially astatic combination of small magnetic needles suspended within a glass tube, the tube being covered with unfoil to minimize electric action, except for a small space through which the needle can be observed. It is claimed that the instrument is sufficiently delicate to detect the presence of one-eighth of an inch of steel or iron wire at a distance of six inches from itself. Such an instrument will be of the greatest service in many cases where the ordinary methods of detecting the presence of foreign metallic substances are ineffective and unreliable.

Complimentary Samples.

Persons receiving this paper marked, are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber please show the paper to others.

Machinists in the Navy.

The United States Navy is finding trouble in obtaining men of the desired quality as machinists. It has been repeatedly pointed out, says *Iron Age*, that this failure does not result from any reluctance to comply with the conditions generally imposed by a military service—cleanliness, discipline and the privilege of going on shore. We think the true reason may be found in the fact that there is inborn in the American mechanic a strong ambition to advance himself. He is willing to begin at the lowest round of the ladder, provided he is assured there is a chance of rising. He is willing, and in fact prefers, to work with the understanding that promotion depends solely upon his ability and attention to business. Further than this, the ambition of the American mechanic, in nine cases out of ten, is never satisfied, because, no matter to which rung he may ascend, he always sees something higher to strive for. These aspirations are killed the instant he enters the navy, and, to express it in a left-handed way, he therefore stays out. He knows that the position of chief engineer will never be within his grasp, no matter how well qualified he may prove himself to be, and that even an assistant position with any responsibility will not be offered him. As far as advancement is concerned he does not enter the navy through the proper channel—he has not the requisite technical education and has not been through a school of marine designing.

We should rather place "the costly machinery of a modern war vessel" in the hands of a man who had long practical experience in the shop and in the care of machinery of a like character, than in the hands of the designer of that machinery who had had no practical experience. When everything is running smoothly the special qualifications of the chief engineer are of minor importance, but it is in the time of emergency, such as an accident to some part, that his skill and training as a mechanic are brought into play, and it is at this stage that wide, practical experience proves superiority.

The advantages to be derived from the system of recruiting from the ranks are recognized in foreign navies and in the merchant marine of every country. Had it not been customary and possible for a man to enter the service at a low rank and finally rise to the highest, Chief Engineer Tomlinson would not have been in charge of the Cunard steamship "Umbria" when her shaft was recently broken in mid-ocean. This was a case of gradual promotion due to merit. It is not too much to assume that had Mr. Tomlinson known that a post of responsibility was beyond his reach he would not have entered the marine service. In the German navy the designing engineers serve on shore, and the engines are in charge of men recruited from the chief machinists. It will be seen that the machinist may rise to the grade of engineer-in-chief. Practically the same regulations govern advancement in the Austrian and Italian navies, and in the latter the mechanic may rise to the grade of a commissioned officer. In these countries the machinery is not in charge of scientifically educated engineers, but of men of practical experience brought, we might say, from the shop. More particularly in Germany, Austria and Italy, there are two distinct classes which in no way conflict with one another—the designer who has nothing to do with the machine he creates, and the engineer who takes the machine as built and runs it to the best of his ability. Promotion follows the law of survival of the fittest and the path to the highest position is open to all.

One benefit that would result from increasing the prize to be sought by the machinist in the United States Navy would be the introduction of men of superior qualifications at the start. Having an incentive beyond their immediate pay to work for, better men would enter the service. Instituting a competition of this character would end in placing the best men in responsible charge, since only those of superior ability could rise.

Silvering Glass.

The following method of silvering glass is, according to an exchange, said to be eminently successful, and is largely adopted in many manufactories: There are two solutions used in the process, known respectively as the reducing and silvering solutions. To prepare the first, dissolve 12 grains of Rochelle salts in 12 ounces of water, and boil; then add, while boiling, 16 grains of nitrate of silver dissolved in an ounce of water, and continue the boiling for ten minutes, after which add sufficient to make 12 ounces. To prepare the second, dissolve

one ounce of nitrate of silver in ten ounces of water; then add liquid ammonia until the brown precipitate is nearly, but not quite all dissolved; then add one ounce of alcohol and sufficient water to make 12 ounces. Distilled water should be used in making these solutions. When both preparations are ready, take equal parts of both solutions and mix them thoroughly; then lay the glass face down on the top of the mixture while still wet, the glass being carefully cleaned with soda and well rinsed with clean water. About two drachms of each solution will be sufficient to silver a plate two inches square. The dish in which the silvering is done should be a little larger than the plate. It is better to let the solution stand and settle two or three days before being used.

The English Language.

Professor Vamhery has been lecturing on the "Fashions of Language" before the Buda-Pesth English Club. English, he said, may now be called the most fashionable language in all the five parts of the world. It began to spread in the first decades of the century through English literature, and in Asia by means of accelerated communication. Steamers were the wings of the English language in the far East, and its spreading from India and the Straits settlements to China and Japan is simply miraculous.

There is no exaggeration in saying that the number of English-speaking Asiatics amount to-day to 3,000,000; that of Europeans to more than 1,000,000, and these, added to the 126,000,000 Anglo-Saxons, give a total of English-speaking men and women of 130,000,000. Should the increase continue in the same proportion, the middle of next century will have 200,000,000 English-speaking persons and the English will have no rival in the world beside the Chinese.

Phonetically English is unsuitable for the foreigner, and the lecturer declares he always suffered acute pain in the jaws when speaking publicly in England and trying to imitate genuine English. The phonetic difficulties are, however, amply rewarded through the expressiveness, the rare precision, vigor and exactness in which English surpasses all other European tongues. London News.

ELECTRO-METALLURGICAL PROCESS.—Some particulars of the electro-metallurgical process which, according to the German experts who have tested the method, is to revolutionize the metal industry have reached us, says *Invention*. Not only iron, but also other metals, such as gold, silver, copper and aluminum, can, it is said, be extracted from their ores by this new and infinitely cheaper method. When it is considered that the current generated by a dynamo driven by a small gas or petroleum engine will be capable of extracting day for day more metal than the largest blast furnace is able to produce, some idea may be formed of the radical changes which are likely to be the result of the employment of the new process. The inventor has, it is reported, succeeded in devising a practical process which has secured the ready support of a number of well-known American and German capitalists, who propose forming a gigantic international syndicate. The statement as to the saving of 80 per cent on the present blast-furnace method is said to be no exaggeration.

To the World's Fair!

WEEKLY EXCURSIONS!

Are you going? If so, call on or write to the undersigned before arranging for your trip. The "SANTA FE ROUTE" is the only line under one management from California to Chicago! Palace and Tourist Sleepers through to Chicago every day without change! Excursions every Tuesday. W. A. BISSELL, G. P. A., 650 Market Street, Chronicle Bldg., San Francisco, Cal.

SUPERIOR MILL AND MINING COMPANY. Location of principal place of business, San Francisco, Cal. Location of works, Placerville, El Dorado County, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 15th day of February 1893, an assessment (No. 1) of five cents (5c) per share was levied upon the Capital Stock of the Corporation, payable immediately in U. S. Gold Coin, to the Secretary, at the office of the Company, Room 2, No. 323 Front St., San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 24th day of March, 1893, will be delinquent, and advertised for sale at public auction, and, unless payment is made before, will be sold on Wednesday, the 5th day of April, 1893, at 1 o'clock P. M., to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.
I. N. WITHERS, Secretary pro tem.
Office, Room 2, No. 323 Front St., San Francisco, Cal.

POSTPONEMENT.

At a meeting of the Board of Directors of the Superior Mill and Mining Company held on the 28th day of February, 1893, the day of delinquency in the above assessment was postponed to April 3d, 1893, and the day of sale to MONDAY, April 24th, 1893, at the same hour and place.

Dewey & Co.'s Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

Cor. Jefferson & First Sts., Oakland, Cal.

MANUFACTURERS OF

ACID, ALKALINE AND WATER-PROOF PAINTS,

Superior to anything of the kind in the market for
IRON, WOOD AND TIN.

Unequaled for Submerged Timbers. Red and Brown Paints for Roofs, Warehouses, Stables, Fences, Etc., mixed Ready for Use. Also, Sheathing Paper, Portable California Mastic Roofing, the Best in the Market for

RANCH AND CITY.

AND UNEQUALED FOR

Teredo-Proof Pile Covering.

This Company also Manufactures a Malthine Compound for

RENDERING BOOTS AND SHOES WATERPROOF.

The same is a superior article for Preserving Harness rendering it impervious to Moisture and keeping it always pliable and soft.

Send to Factory, Jefferson and First Streets, Oakland for Samples and Prices.

PRACTICAL TREATISE ON HYDRAULIC MINING.

By AUG. J. BOWIE, JR.

This new and important book is on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on Heavy Grades methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdy, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. A very practical work for gold miners and users of water. Price, \$5, post-paid. For Sale by DEWEY PUBLISHING CO., 220 Market St., San Francisco, Cal.

THE RUSSELL PROCESS.

BOOKS ON ASSAYING.

By C. H. AARON.

Part I.—Gold and Silver Ores.

SECOND EDITION—PRICE \$1.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:

Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorchification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Ozel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutions and Expedients; Assay Tables.

The volume embraces 130 12mo. pages, with illustrations, well bound in cloth; 1889. Price, \$1, postpaid. Sold by DEWEY PUBLISHING CO., Publishers, No. 220 Market Street, San Francisco.

Parts II and III.

Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Etc.

SECOND EDITION—JUST OUT.

Price \$1.75.

This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.

Table of Contents:

Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Humid Assay of Silver; Oxy-Lusac's Method; Volhard's Method; Manipulation; Lead Ores; Copper Ores; Tin Ores; Mercury Ores; Zinc Ores; Nickel and Cobalt; Chromium; Bismuth; Arsenic; Antimony; Sulphur; Salt; Note.

One of the methods given for the Assay of Copper is new, original and exact, as is also one of the processes for Zinc. The book contains 161 pages with illustrations, and is strongly bound in cloth. Much of this original text is replaced by new matter.

Price, postpaid, \$1.75. Sold by DEWEY PUBLISHING CO., Publishers No. 220 Market St., San Francisco.

GLADSTONE MINING COMPANY, C. J. Clark, M. E. Gen'l Supt. FRENCH GULCH, Calaveras Co., Cal., Dec 12, 1891.
 MESSRS. ADAMS & CARTER, San Francisco, Cal.—DEAR SIRS: During my experience in mining and milling, I have used twenty-four of your four-foot Frue Vanners on different kinds of ore, both gold and silver. I have made competitive tests against them with other widely puffed-up concentrators and have always found the Frues in first place. When I built this mill (20 stamps), I determined to put in six-foot Frues in order to save space and machinery. I am now running four of your six-foot machines and they have been going for Twelve Months. They are taking the pulp from 20 stamps, crushing a minimum of fifty tons per day, and do better work than the four-foot tables. They require no more attention than a four-foot table and handle at least twice the quantity of ore. I have run them up to 80 tons per day and could not see that they were crowded. They stop and start as easily as the smaller tables and have the advantage of double capacity with the same bearings and wearing parts, requiring no more oil, and no more wear and tear than the smaller tables. My repair account for the past six months has been too small to mention. In order to give an idea of the work they are doing here I will state that the ore has varied monthly from \$8 to \$20 per ton and the tailings from nothing to 80 cts. per ton. I will conclude by saying that I cannot endorse the six foot Frue Vanner too highly, and it is the only table that I would have in my mill.

C. J. CLARK, Gen'l Supt.

CONCENTRATORS

ARE OUR SPECIALTIES.

THE BLASDEL CONCENTRATING BELT COMPANY.

We are now having our new Improved Concentrating Belt manufactured in San Francisco. We keep always on hand Belts suitable for the Triumph and Frue machines, but can make any length or width desired. The advantages of these belts over any others will be readily seen by practical millmen. First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers, thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight rifled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevent it from banking on the sides and forming channels through the center. These slight rifles also save very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth. We can safely say that it is a better concentrating belt than has ever been manufactured. It will last much longer and will handle more pulp. We also manufacture smooth belts with same flanges when desired.

H. G. BLASDEL, Jr., Manager, 419 California St., San Francisco.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

KEYSTONE.—*Ledger*, March 31: The Keystone mine, at Amador City, is to be lighted by electricity. The plant will be an extensive one. Surveying has been done preliminary to putting in the plant. The New London, Plymouth district, the property of Wm. Hynds & Co., has been bonded to Eastern capitalists for five months. The new company intends to go to work on the property in a short time, erecting machinery and developing the mine. Nothing definite can be learned as to when the Zelle mine will resume operations. It will be several weeks yet, however, as there is considerable repairing to do. Our people will naturally rejoice when work begins at the mine, as it will add a monthly revenue of \$3000 to \$3000 to the town. As we have before noted in this column of the *Ledger*, the Bunker Hill is about to be opened by a company of gentlemen from the East. They have secured a working bond on the property and their manager is now on the coast looking after their interests. Certain work has to be done within a certain specified time, and they will have to get to work immediately in order to save their bond. The manager says they will get to work in a few weeks. The Bay State Mining Company has had a hard contest with the water during the last six months. Some time ago it contracted with Knight & Co., for a pump, which was put in operation about a month ago. For some time the working of the machinery was not what it should have been, but the contractors made some changes which have produced desired results, and now the Bay State's pump comes up to the requirements of the contract. Knight & Co. have put in another pump temporarily to lower the water, and when it is down the company's pump will be able to keep the mine clear. It is confidently expected by those most interested that in a short time they will be able to resume work in the mine.

VOLCANO.—*Amador Record*, March 30: Some damage has been done here by the late storm. The Volcano Company's hydraulic equipment has had a great influx of debris from above. Sutter creek, with an unprecedented volume of water, brought down an immense quantity of old tailings, which will set back their pay-dirt washing some weeks. Mr. Peck, who owns some good tailings north of the town, had them washed down to his flume in such a quantity that the flume choked up and he could not manage the wash. He is philosophical, however, and worries not. He has quite an extent of ground running up through the town. The Fort Ann and Robinson mine, Mr. Norton superintendent, has been compelled to suspend operations for awhile. There is more water than the pump can handle. At the Mexican mine, after running a long tunnel, Supt. Beardsly has encountered gravel. We did not learn what it prospects. Mr. Byrd is elated over a rich find made on his place three miles west from here. It seems that years ago a man named Eastman and others sank a shaft 50 feet deep in the meadow. Owing to death the work was abandoned. Lately Mr. Byrd took a pan of the dirt from near the shaft, and to his surprise and pleasure obtained \$1 therefrom.

Butte.

BOOMING MINAS.—*Oroville Mercury*, March 30: It is very encouraging to note the increased interest in mining affairs in Eastern Butte. Hardly a train arrives in Oroville but what hears capitalists and prospectors on their way to the quartz mines in this section. This revival extends from the Oregon City mines, near Oroville, eastward to the Hurleton and Forbestown districts and northeasterly to the Merriam and Lumpkin ranges. The most pronounced boom is at Forbestown, where two very large properties are being operated. Fifty stamps and immense reduction works, the largest in the northern part of the State, are running night and day, and the works are to be added to extensively. These works employ big crews of men at good wages, and capitalists are preparing to open other mines. Buildings are going up on every hand and the town is said to rival its old-time prosperity when a thousand men dug gold from the surrounding hills. At Hurleton, too, there are extensive developments going on and several large mines are being systematically opened. Oregon City has its boom, and in every section of Eastern Butte prospectors and capitalists are looking for ledges. The best of all this activity is that it promises to be permanent. The old primitive slip-shot methods of working quartz have been abandoned and latter-day systems and methods have been inaugurated. The quartz mines of Butte never paid in early days because they were not properly handled. They are yielding rich returns now because their owners are using science, common sense and economy in their working. It costs money to open quartz mines, and the rich ones at Forbestown were developed at a cost of several hundred thousand dollars before they began to yield returns. That it was money well spent the present status of affairs indicates. The Stow mine is said to be yielding at the present time \$15,000 a month above all expenses, and the ledge is so extensive that enough ore is in sight to operate the present mill 30 years without running new levels. From present indications we are safe in saying that the next two years will witness an influx of people into eastern Butte unparalleled in its history.

Calaveras.

MUAPHYS.—*Calaveras Citizen*, March 30: A large force of miners has been put on duty at

the Beatrice mine here, and it is presumed work will be urgently prosecuted during the coming months. One of the greatest deterrents to the development of mines in this vicinity is the fact that nearly every piece of land for miles has been subject to agricultural locations which debar all legitimate following of quartz prospecting or mine opening. J. S. Sublet brought in some good ore from the "Chimney Rock" mine located by him beyond the Stanislaus river. He affirms that, in addition to the quartz mine found by him, there is a deposit of gold-bearing placer within the boundaries of the "Chimney Rock" location. I paid a visit to-day to the long tunnel of McCormick, Bisbee & Thomas, at Douglas Flat. The courtesy of a visit was extended by Mr. Thomas, one of the owners, and he gave a detailed illustration of the working of the tunnel and its purposes. The tunnel is now in a distance of 1300 feet and is straight as an arrow. A number of strata has been passed through. Cobble, lava, granite, hard, blue slate and conglomerate are among the varied formations. Two shifts are working—the night and day shifts. Both shifts are composed of men of years of experience, as the splendid workmanship of the tunnel will show. Hand-drills are used and both single and double drilling is carried on as the positions warrant. It is thought there will be about 4000 feet more to be run to tap their main channel on Central hill, though the gravel channel may be encountered at any time now. Two air shafts have been sunk at sections to furnish air for the workmen and of which there is now a good supply, easily expelling the smoke after blasting. The owners are sanguine of opening up one of the best mines in the county at an early date, and they have basis for their expectations, as no mine could pay better than did the Central Hill mine at its past working. The owners are all old-time residents of Calaveras county and are pushing the enterprise for all the mine is worth, and with no view to eventual speculation.

El Dorado.

BEAR CREEK.—*Georgetown Gazette*, March 30: Demuth Bros. have suspended operations on their mine at headwaters of Polecat gulch, but will resume shortly with hydraulic pressure. Bear creek was much higher during the last freshet than ever before in the memory of the oldest inhabitants. The outlook for mines and miners was never so promising as at present. The seam diggings of H. A. Wagner are netting their owner handsome dividends, yielding as high as \$10 and \$12 to the pan. This is a valuable property, and will no doubt be operated on an extensive scale by San Francisco parties during the coming summer. The gold is exceedingly fine, but if it could all be saved by improved machinery, it would undoubtedly prove to be fabulously rich.

Mono.

STRIKE AT BENTON.—*Inyo Register*, March 30: J. O. Wheeler has made a strike about nine miles southwest of Benton, in the Clover Patch district. The ore is free-milling gold, running from \$25 to \$50 a ton. It is thought that Mr. Wheeler has found a proposition that will recompense him for his long work at Benton. Some of our exchanges report concerning the strike that it gives nine-thousand-dollar assays, etc., but the above facts are obtained from direct authority.

Nevada.

THE GREEN MOUNTAIN MINE.—*Grass Valley Union*, March 31: Most of the machinery has already been moved from the old Green Mountain shaft to the new, and two more weeks of good weather will see the work completed. The new shaft is going down very rapidly, but at present the miners are bothered somewhat with water.

OSBOEN HILL MINE.—*Grass Valley Union*, April 1: Work is being pushed rapidly forward at the Osborn Hill mine, of which Mr. Goldstone is superintendent. Workmen are busy cleaning out the shaft, and the work is nearly completed. The new building and machinery will be placed in position the coming week. A very fine looking piece of rock was taken out with the debris yesterday. It had been detached from the ledge by a cave in the shaft. The rock showed gold very nicely and was filled with mineral.

THE SPANCEVILLE COPPER MINE.—*Spenceville*, the location of the Imperial Point and Copper Co.'s mines and plant, now under the able superintendency of Mr. Otto Woehler, is presenting an appearance of great activity. Copper cement is being constantly shipped to the railroad and vast improvements are contemplated in the plant works. The old furnace is being demolished and a new one will be constructed which will be the finest of its kind on the coast. An increased number of men will be employed in the near future, and the prospects are that this little community will soon become a thriving town.

QUARTZ.—*Placer Herald*, March 30: A few of the railroad boys, who are known on this division, are opening up a quartz mine across the river in Nevada county, about 12 miles from Auburn, which, it is said, promises to prove a fine property. They have a well-defined three-foot ledge which is prospected to a depth of over 150 feet, and shows good milling ore from top to bottom. Some tests made in an arrastre yielded about \$15 a ton. They have a mill erected at the mine which they are preparing to run by steam-power, an engine having been recently purchased at Grass Valley for that purpose. Among the owners are Lew Pierson, Geo. Moffett and Thos. Rudick, all prominent and popular railroad boys.

Placer.

BORING FOR GRAVEL.—*Placer Herald*, March 30: The boring machine for prospecting gravel mines, referred to in a late issue of the *Herald*,

has been set up and is being operated on the Forest Hill divide. The Drummond quartz mine, between fowa Hill and Forest Hill, the property of Hon. C. F. Reed, has developed a very rich lead lately, and report says it is now turning out some as fine rock as ever came from a quartz mine in the county.

ANOTHER STRIKE.—A. O. Bell, who made the big strike some years ago on Bald Hill and took out a good many thousand dollars in a comparatively short time, has made another strike which, from all accounts, is as rich as the former one. The strike was made this time on the old Brokaw place, on the Clipper Gap road, between four and five miles above Auburn. He struck rock carrying free gold, we understand, within a few inches of the surface, and in one day took out about \$1000. It is said the lead is well defined, and, at last accounts, its richness was holding out. Bell is a persistent prospector, has unlimited faith in the richness of this region, and in his day has made more lucky finds than any other prospector in the county. He is a big-hearted fellow and when he has money he spends it with a lavish hand, and, consequently, everybody rejoices to hear of his good fortune.

San Diego.

STROCK IT RICH.—*Los Angeles Times*, April 1: A few days ago A. G. Hanson, an old miner, J. G. Austin and A. H. Colby, a well-known breeder of Shorthorn cattle from Nebraska, who is down here for his health, made a strike of an unusually sensational nature while prospecting in the mountains about 30 miles northwest of Julian, in San Diego county. In an interview with a *Times* reporter yesterday, Mr. Colby stated that he and his companions found a big rock of peculiar formation, which was entirely foreign to its surroundings, some four miles below the gulch in which they finally located. This rock, upon being broken up, proved to be rich in gold, and upon this clew the trio started out in their search for wealth. For several days no trace of the rock for which they were hunting could be found; but finally, while walking up a narrow gulch, they saw a ledge of it cropping out of the side of the mountain some distance above them. Upon climbing up to investigate, they found, to their surprise, that the ledge, which was at least 50 feet in width, and cropped out for 40 or 50 yards, fairly glistened with gold, and monoments were at once erected and claims staked out by the jubilant prospectors. A small flask was produced by Mr. Colby containing a sample of the pounded ore taken from the Good Luck mine, as it has appropriately been named, which fairly teemed with the precious metal. The news of this lucky find soon spread, and a large number of miners are already in camp in the vicinity.

Siskiyou.

PLACERS.—*Yreka Journal*, March 29: The Spangler Bros. are making preparations for big work in their extensive placer mine at the mouth of Humboldt creek this season. They will open up the claim from Klamath river, along the creek bed, having just secured a fine double-action or double-cylinder 15-horse power steam engine to hoist the pay gravel into the sluices and also hoist or haul out of the way the immense boulders at the mouth of the creek. They will also drain the claim with a large pump run by an overshot wheel in the creek, using both creek and seepage water for sluices. In case the creek gets too low to run the wheel in midsummer, a wheel will be placed in Klamath river or else the work may be continued day and night by steam-power. The pump must be kept working all the time, hence the necessity of a water-wheel for the pump when the claim is only worked during the daytime. An exceedingly rich find of cinnabar has been discovered lately by H. J. Barton and P. C. Lange on Klamath river, opposite the mouth of Horse creek, below Oak Bar, the claim being known as the Molly O'Leary mine. From prospects so far realized, this mine is destined to prove one of the richest cinnabar lodes in the State, and is also believed to be very extensive. Archie Nichols has been taking out some very rich specimen quartz lately from his ledge on the north fork of Greenhorn, and should he find the ledge permanent, it will be a fortune. C. A. Bsgart & Co. have been ground-sluicing steadily for some time past at their placer claim on Dutch creek, Klamath river, and expect to realize a handsome yield. They intend to keep on sluicing until the water supply gets low before making a cleanup. Austin & Co., of the Greenhorn blue gravel mine, have finally succeeded in fishing up their big pump after considerable hard work in pumping out sufficiently with a number of small pumps. Their big steam pump is now fixed up in first-class order, which will keep the claim drained for good work as soon as the water is all pumped out. The shaft is over 100 feet deep, which, with the drifts, contains a great amount of water, and a heavier flow is coming in at the present time than at any other period of the year, but not more than the pump can handle easily. A. Kaiser and H. Nicholas have taken out about 25 tons of good-looking quartz from the Clark & Wheeler ledge on Humboldt, and will continue getting out more so as to have a good supply for crushing by the time the snow melts off the road for hauling to mill at the forks.

Trinity.

THE HOBBAEN MINE.—*Trinity Journal*, April 1: Last summer a party of Colorado capitalists purchased the Hubbard mine and water-right and the water-right of the John Smith estate and incorporated under the title of the "Trinity River Hydraulic Gold Mining Company." A ditch 12½ miles in length was constructed from Redding's creek to the mine capable of carrying 600 inches of water and at an elevation sufficient to give a pressure of 176 feet at the present opening of the ground. The ditch was surveyed by, and constructed under the direc-

tion of, W. S. Lowden, and the work is well done; and, barring the sides and caves which all newly constructed ditches are subject to, it stands the storms very well. The mine was opened at one of its lowest points and the flume given a good grade, and the amount of auriferous gravel handled by the quantity of water above mentioned would astonish a novice at the business. The water is reservoired and a five-inch nozzle is used on the giant, the stream playing on the bank about 10 hours out of the 24. Two undercurrents are used to catch the fine gold and such other gold and amalgam as escapes from the two main flumes. Last

Wednesday we had the pleasure of visiting the mine in company with L. L. Bailey. On arriving there we found the mine running under economical management, J. R. Flagg superintending, and a quantity of gold that would make a poor man's eyes water was visible in the bedrock ditch and flumes when the water was turned off. Probably there is not a mine in the State that can show more gold for the amount of water run than the Hubbard. A run of 42 hours gave the company a cleanup of 80 ounces from one flume alone, and it is estimated that as much more was deposited in the other flume and undercurrents. The water has been in the ditch constantly since the 17th of March without a break, which is pretty good evidence of the substantial manner in which the work has been done. Wm. Gelder, of Gelder, Bailey & Co., mining brokers of Denver, is president of the company and A. G. Dunbar, who is quite well known here now, is vice-president and general manager—both experienced mining men and noted for their integrity and fair dealing. Mr. Bailey, of the above-named firm of mining brokers, is a young man of sufficient energy and push to make a success of any enterprise he undertakes, and his shrewd judgment makes him a safe man to follow. Just before going to press, we are informed that arrangements have been consummated by which the property of the Trinity Gold Mining Company (Ward mine) is about to change hands. Some of the same parties who are interested in the Hubbard mine are taking hold of the Ward mine, and when water is brought to this ground as contemplated, it will be one of the most gigantic mining propositions in the State. The ground is very rich and the acreage large, and the only thing that has kept this property from producing more bullion than any other on the Pacific Coast was lack of wealth on the part of the owners to bring in sufficient water.

Washoe District.

CON. CAL. & VA. MINE.—*Virginia Chronicle*, Apr. 1: 1500 level—Have continued to extract ore and old fillings in working upward in the old south stopes, from the 10th to the 15th floors above the sill floor of this level. 1600 level—Are extracting a few tons of ore from the old stopes east of the main south drift. 1650 level—We continue to extract some ore from the old stopes, eight floors up in the upraise No. 6 carried up from the main northwest drift; also from the old stopes in working north from the crosscut run west from the northwest drift. From these north workings, 27 feet up, a west drift has been advanced 23 feet; total length 53 feet; continuing in a porphyry and quartz formation carrying a low assay value. From this west drift, at a point 50 feet in, an upraise has been started. Have extracted during the week from all parts of the mine 649 cars of ore about 640 tons. Shipped to Morgan mill 625 230-2000 tons of ore. Average assay value, per railroad car samples, \$35.71. The average assay value, per battery samples, of all the ore worked at that mill during the week (905 tons) was \$32.52 per ton. Bullion shipped to the Carson Mint, assay value, \$13,023.87. Bullion now on hand in our assay office, value about \$13,000.

OPHIE.—1555 level—The winze now going down below the sill floor of this level has been sunk during the week 15 feet; total depth, 30 feet. The bottom is in porphyry and streaks of low assay value.

MEXICAN.—On the 1565 level—West crosscut No. 2 from the north drift from the east crosscut from the bottom of the winze, sunk from the 1465 level down to this level near the south boundary, has been extended 20 feet; total length, 89 feet, continuing in a soft porphyry formation carrying clay separations and showing fine lines of quartz.

UTAH.—340 level—The south drift from the main west drift at a point 595 feet in from the shaft has been extended 24 feet; total length, 229 feet; continuing in porphyry, clay and quartz formation.

SIERRA NEVADA.—The intermediate tunnel on Cedar Hill has been advanced during the week 13 feet, making the total length 250 feet; the formation in the face is porphyry and clay and stringers of low-grade quartz. The joint Sierra Nevada and Union west drift, 900 level, has been advanced the past week 21 feet, making the total distance west of the joint shaft 3057 feet; this face is in hard porphyry.

UNION SHAFT.—The joint Sierra Nevada and Union west drift, 900 level, has been advanced the past week 21 feet, making the total distance west of the joint shaft 3057 feet; this face in hard porphyry.

ANNES.—North drift from east crosscut No. 1 north on 420 level advanced 15 feet; total length, 187 feet; formation, clay and quartz.

GOOLN & CORRY.—Sutro tunnel level—The joint east crosscut with Best & Belcher Company has been extended 19 feet; total length, 134 feet; face in porphyry. From the end of this crosscut we have started a west crosscut and advanced same 7 feet, passing through porphyry.

BARR & BELCHER.—Sutro tunnel level—The joint east crosscut with Gould & Curry Company has been advanced 19 feet during the

week, passing through porphyry; total length, 134 feet. From the end of this crosscut we have started a west crosscut and advanced same 7 feet; face in porphyry.

HALE & NORCROSS.—Main Shaft.—Have finished putting in guides in the north hoisting compartment. Main Incline.—We continue making the necessary repairs. 1800 level.—Advanced west crosscut on our south boundary 21 feet; total length, 53 feet; face in porphyry and quartz.

CHOLLAR.—Are repairing the west crosscut, 450 level, and retimbering the two north compartments of the main shaft above 930 level. The east crosscut near the south line, 930 level, is out 85 feet; face in clay and porphyry.

POTOSI.—East crosscut No. 3, 850 level, is out 329 feet; face in hard porphyry. The north drift from the east crosscut opposite the Potosi winze, 930 level, is out 75 feet; face in clay and porphyry. Have started a cross-cut west from the last named drift, which is out 10 feet; face in porphyry. The raise from north drift, 1000 level, is up 18 feet; roof shows 3 feet of quartz, car samples of which assay \$20. Are repairing Potosi winze below the 1000 level. Are still retimbering the Ward shaft. Extracted and sent to the mill the past week 504 tons and 1750 pounds of ore from the 550, 930 and 1150 levels. Milled during the week 508 tons. On hand at mill, 140 tons and 1750 pounds. Average battery assays, \$26.88; average car sample assays, \$29.05.

BULLION.—Are retimbering the Ward shaft 100 feet from the surface.

APEX.—Have sunk winze 20 feet during the week; total depth 40 feet. The ore increases in value as we go down. Promises of finding a large body of ore when we attain a greater depth are very encouraging.

EXCHEQUER.—Are retimbering the Werd shaft 100 feet from the surface.

WARN SHAFT.—Are retimbering the shaft 100 feet from the surface.

KENTUCK.—From the stope above the 160 level we continue to extract from two to three tons of ore per day of the average value of \$28 per ton as per car samples. The south drift from the Jacket east crosscut on 1100 level is in 191 feet and continues in ore of fair quality.

OCCIDENTAL.—The main north drift on 750 level has been extended 11 feet; total distance from the bottom of No. 1 winze, 698 feet; the face is in quartz and porphyry. Have stopped work in No. 2 winze from south drift, 750 level, and have resumed work in the upraise started above said winze. The raise is up 60 feet and top is in fair-grade ore. The Zedig drift, Sutor tunnel level, has been extended 15 feet; total length, 897 feet; formation, porphyry and clay.

CON. NEW YORK.—The winze below the 650 level is down on the slope 116 feet; the bottom is in quartz, some of which gives good assays. The west crosscut from the southwest drift from the shaft, 850 level, is out 126 feet; face is in hard porphyry.

SILVER HILL.—The southeast drift on the 450 level has been advanced 5 feet during the past week total distance from north line, 83 feet; face in hard porphyry.

Tuscarora District.

NAVAJO.—Times Review, March 31: The stope above the 350-foot level are yielding about the same, as is also the stope above the 150-foot level.

BELLE ISLE.—The stope above the 250-foot level are not looking quite as well as at last report.

NORTH BELLE ISLE.—The stope above the south 300-foot level has yielded about the same. North drift, same level, extended 11 feet; the face looks more encouraging.

Kennedy District.

THE OUTLOOK.—Walker Lake Bulletin, March 24: W. G. Wilkinson, who formerly mined in this county, writes as follows from Kennedy district, Humboldt county: The mining outlook is better here at present than it has been at any previous time. The imperial mine is now pretty well opened up for 400 feet along the ledge by tunnels Nos. 1, 2, 3, 4. No. 1 is in 85 feet; No. 2, 250 feet; No. 3, 80 feet, and No. 4, 100 feet, with a shaft down from No. 2, 50 feet, end all showing a ledge from 1 to 4 feet of good average ore. The Cricket, half a mile east, owned by the same parties—Kennedy, Benton & Co.—has a tunnel in 135 feet, with a ledge of the same grade ore. Then there is the Kearsarge, on the same ledge as the Imperial, owned by Wiggins & Blossom, that has a tunnel of 150 feet, showing a ledge and ore of similar size and character. The Alta, owned by Ed. Stone, adjoining and lying parallel to the Kearsarge on the west, is opened up by tunnel. Fifteen tons of ore are on the dump awaiting shipment as soon as the roads get so that teams can get in. The Gold Note, lying two miles to the southwest of those, is owned by Lawler, Dowdley & Co., and has a ledge of from 18 inches to 4 feet, of high-grade ore; also worked through tunnel. I have a claim of my own that I have run a crosscut tunnel 85 feet, and have out three stringers from 8 to 12 inches, that assay \$17 to \$23. I have yet to run 25 or 30 feet to get to the main ledge before I can tell what I have, but, like other prospectors, expect to strike it rich when I get there. The ore of this camp is mostly too low to ship at a profit, on account of being so far from the railroad, but would pay well to mill here, end, from the amount of work done, there appears to be an almost unlimited supply of ore that will go from \$10 to \$25, with a fair amount that will mill from \$50 to \$100. Kennedy & Co. shipped two carloads last fall that worked over \$80, and are getting out a three-carload lot now that will work as well or better than what they had worked, and between them and Stone, Lawler & Co., I think there will be regular shipments from here this season which will attract more

attention and cause more work to be done, and will be the cause of opening up other properties. I think we will have a mill here soon, which we need badly; then the district will speak for itself.

ALASKA.

FROM THE YUKON.—Jenneau Record, March 23: C. H. Hamilton and John Reed arrived in Jenneau last Monday from the Yukon. They were 40 days coming out, 10 days of which they were in camp, thus making their traveling time only 30 days. They did not bring any important news beyond what was brought out last fall. J. J. Healy's boat, with a trading and mining outfit, did not reach Forty Mile last season, but will arrive as early in the spring as possible. During the winter the miners enjoyed good health and the camp seems prosperous.

TAKOU.—Willis Thorp has leased the Takou Mining and Milling Co.'s property and intends running the mill this season. This property has been operated two seasons out of five. Ore was taken out in numerous places, or, in other words, the property was worked like a person digging a mess of early potatoes, by picking out the best hills. By so working, good returns resulted, but discord in the company resulted in its being shut down. It is hoped that Mr. Thorp will work the property on mining principles and develop it to its full capacity.

BERNER'S BAY.—Next week Mr. H. Mead will start for Berner's Bay for the purpose of making preparations for the commencement of the Berner's Bay Mining and Milling Co.'s 20-stamp mill. Mr. Mead is an excellent millwright and has done some excellent work in Alaska in that line. He put up the Silver Queen Co.'s mill at Sheep creek, on which the excellent workmanship and the arrangements for working cannot be surpassed. He was foreman of the chlorination works of the A. T. G. M. Co. and gave general satisfaction, and when the Berner's Bay mill is completed it will be safe to say that it will be second to none on the coast.

BONDER.—H. E. Hunsaker has given a lease and bond to J. F. Cryder, a mining man from Aspen, Colo., on his Ascension property, on Sheep creek. This property adjoins the Glacier mine on the southwest, the Golconda and Emma mines lying parallel with it on the north. Last season Mr. Hunsaker shipped a ton and a half of ore from the Ascension to the Tacoma Smelting Works that gave returns of about \$100 per ton. This is a good proposition, with considerable good ore in sight.

ARIZONA.

THE OUTLOOK AT WHITE HILLS.—Moheve Miner, March 30: There has been a rumor current on the streets this week that the White Hills Company had discharged all its men and that the mines had been shut down indefinitely. There is absolutely no truth whatever in the report. From late advices received regarding the mines at White Hills everything indicates that the camp is in a thrifty condition, and the prospects are quite favorable for continued prosperity. The company has laid off eight or ten men, not because of any abatement in the mineral output, but because they are doing considerable dead work and have not room for more men until this work is completed. An air shaft is being sunk for the proper ventilation of the G. A. R. mine, as it is not considered safe to continue working in the lower levels under the present system of ventilation. As soon as this air shaft is completed a larger force than ever will be put on end large quantities of the precious metals will be extracted. All the mines in Indian Secret, Weaver and Minnesota districts, together with those of the new gold discoveries 12 miles north of White Hills, are looking better than ever, and it is said by competent judges that this year will see an era of prosperity in that region never before equaled in the history of Mohave county. Frank Feeler is now foreman on the Occident and Horn Silver mines at White Hills. There are about 20 men working on these two mines and more will be added as rapidly as the ground is opened for their accommodation. Conkey & Tyler have completed their lease on the Prince Albert mine at White Hills and will shortly resume operations on a claim owned by them situated on the Canyon Station divide, near Mineral Park. The claim is known as the Lalyng and has produced good ore when worked. Oscar Cowan returned from his prospecting trip along the Colorado river below Needles Tuesday. He does not report any rich strikes, but he found several good-looking ledges during his trip. John Sullivan, who accompanied him, will visit the Harqua Hala country before returning. By Collins, recently returned from the Blackfoot mine, Todd Basin, informs us that that property is producing some exceedingly rich ore—some of it runs 60 ounces in gold and over 500 ounces in silver per ton. Of course this is the first-class ore. Messrs. Stinson & Jimmison have out over a carload and will make a shipment some time this month. The Senator Gold Consolidated Mining Co., of Gold Basin, has just ordered 50,000 feet of lumber for the erection of a ten-stamp mill at the mouth of Salt Wash, 13 miles east of the mine.

BRITISH COLUMBIA.

HIDDEN TREASURE SHOWING.—British Columbia Miner, March 30: Most encouraging reports continue to be brought from the Hidden Treasure. On Sunday, when the owners visited it, the vein had been crosscut for six feet, showing nice concentrating ore all the way. An inch or two of shale was then encountered, and, after this was crosscut, vein matter was again met, carrying ore of a better grade. It appears to be getting richer as the hanging wall is approached. Some very nice specimens were brought down, rich in peacock and gray copper. By the time the hanging wall is reached, the Hidden Treasure will have one of the big-

gest showings on Toad mountain. From the calculations made before starting the tunnel, the vein should be 16 feet wide. If this is so, it is only half crosscut, and the indications are that a very rich streak will be found in the hanging wall. About a month ago the Hidden Treasure was sold for \$1500; now, \$30,000 could not buy it. The owners, immediately after purchasing, set to work and they fully deserve their luck. They have added another to the unusually rich claims on Toad mountain, and uncovered a body of ore unparalleled, except in the Silver King, and the whole camp will reap the benefit. The Hidden Treasure lies about 2000 feet due west of the Silver King, which it parallels, and in the western extension of the Democrat, and is the second extension of the Goldendale. It is possible that it is the same lode which was shown up on the Goldendale last summer.

DAKOTA.

SALE OF MINING PROPERTY CLOSED.—Deadwood Pioneer, March 30: The deal for the Treadwell Fraction and Blunderbuss, Little Nell and Lewis lodes, was formerly closed yesterday, J. S. Childs, superintendent of the Harney Peak Tin Company, being the purchaser. As indicated in these columns yesterday, the Treadwell and Blunderbuss were owned by Daniel Flickinger, and the Little Nell and Lewis by John Delaney, Gus Oberg, John Clancy and Arnold Lewis, and it is authoritatively stated that the price paid for the four claims falls but little short of \$65,000, constituting one of the most important sales in the Hills. Mr. Childs took a hand on the properties some months ago, and although considerable development work has been done since that time, the purchase, he informs a Pioneer reporter, was made mainly on the reports of Prof. Walter P. Jenny, who has carefully inspected all the properties. These inspections, in which were embraced numerous tests of all the various ore deposits exposed, assayed in no instance below \$30 to the ton, and in several cases ran as high as \$400. In speaking of his purchase yesterday, Mr. Childs said: "I have bought these properties as a personal investment, and reports to the effect that the purchase is for other parties are entirely erroneous." Continuing, the gentlemen said he had been attracted to the properties by quiet reports of their value, and some time ago determined, if they could be had at a reasonable figure, and held up as well as he was led to believe they would, that he would buy them. He has not fully decided as to their operation, but left for home yesterday feeling that he had secured some mining property as rich as is to be found in the Black Hills. Changing the conversation to the subject of the Harney Peak tin property, Superintendent Childs said: "You may quote me, if you wish, as saying that the present shut-down is not permanent, although I cannot say when operations will be resumed." Continuing, Mr. Childs said there are at present at work, keeping the various mines clear of water and looking after the property in a general way, about 30 men, and that he has no idea this force will be reduced. Superintendent Childs smiled at the report that he had severed his connection with the Harney Peak Company, remarking that this was the first he had heard of it. In conclusion, he expressed the opinion that operations would be resumed on a larger scale than ever before, the time and extent of which, however, rests entirely with the stockholders.

MONTANA.

PURITAN.—Phillipsburg Mail, March 30: There has not been much to report about the Puritan Company for two months past; but if the vein of ore struck in the east crosscut from the 300-foot level continues to improve as it has done in the past two or three days, there will be plenty to say about the company and its property. It is the hope of all that the Puritan has seen its darkest days, and certainly the management is deserving of reward for the faithful manner in which the "dead" work has been carried on. Since the present management took hold of the property it has done about 1300 feet of underground work, and for a long time hoisted an average of 90 buckets of ore a day; but the ore in the upper levels seemed to be in pocket formation and did not hold out, consequently sinking was continued to the present depth, where there is every indication of permanency to the leads that come together in the east crosscut.

PLACER MINING.—Considerable placer mining will be carried on in various parts of Montana during the season which is soon to open. J. R. Mackey and others are preparing to start operations in Washington gulch, and from other sections we learn that the placer-mining industry will take renewed life this season.

OREGON.

MORE NUOGETS.—Rogue River Courier, March 30: Jeff Hayes and Chas. Swindon brought in two nuggets of gold from their placer on Oscar creek last week, one of which weighed 13½ ounces and was valued at \$220. The other was somewhat smaller. The large nugget was shaped and sized like an Eastern oyster and contained some quartz which was imbedded in the yellow metal. The placer is in the same vicinity as that in which the \$365 nugget was found a few days previously by Broder Custar. The streams emptying into the Applegate and Williams creeks are simply full of gold. On Monday a 4½-ounce nugget was brought in from the same place.

WASHINGTON.

STUCK IN RICH.—Okanogan Outlook, March 25: The Rush mine on Mt. Chacapa is coming to the front with rapid strides. In the crosscut on the 125-foot level a seam of very rich ore was encountered last week near the hanging wall, and Mr. M. G. Barney, one of the owners, who has been stopping at the mine for the last two weeks, brought down several hundred

pounds of the ore, some of which is as rich in free gold as anything yet found in this section. The ledge at the point of crosscut is about 12 feet wide, with over eight feet of ore. The pay streak on the hanging-wall is five feet in width. The discovery of the yellow metal in such large quantities at this depth is very encouraging, to say the least, and the owners of the property, who have had every faith in the mine from the start, are to be congratulated on their good fortune. Development of this property will be continued with renewed vigor, and there is small room to doubt the ultimate result. The Rush group of mines, as a paying and permanent institution, is practically assured.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING MARCH 23, 1893.

- 494,455.—APPARATUS FOR DISTRIBUTING WATER.—F. M. Barkhaus, Jr., Wrights, Cal.
- 494,466.—INDEX.—L. L. Dennick, Los Angeles, Cal.
- 494,470.—HEATING ATTACHMENT FOR GAS-BURNERS.—Geo. Edwards, Berkeley, Cal.
- 494,474.—LIQUID SHAKING MACHINE.—E. H. Gerrish, S. F., Cal.
- 494,421.—HONEY-EXTRACTOR.—O. M. Hill, Santa Paula, Cal.
- 494,205.—SALT BOX.—W. L. Johnson, Pomona, Cal.
- 494,436.—SUBROIAL APPLIANCE.—Frank Orth, Astoria, Or.
- 494,437.—SUBROIAL APPLIANCE.—Frank Orth, Astoria, Or.
- 494,456.—FANNING COVER FOR BEDS.—R. B. Parrish, Portland, Or.
- 494,487.—SAW-FILER.—A. G. Phillips, S. F.
- 494,534.—CASH-REGISTER.—E. T. Taylor, Oakland, Cal.
- 22,308.—DESIGN FOR SPOON HANDLE.—W. S. O'Brien, S. F.

The following brief list by telegraph, for Mar. 23, will appear more complete on receipt of mail advices:

California.—William T. Armstrong, Lerdo, cheese-making apparatus; Theodore Bessing, Los Angeles, gymnastic apparatus; John A. Bliz, Pleasanton, two-wheeled vehicle; James Dowdell, St. Helena, apparatus for making wine; John Martin, Berkeley, grate; James L. Morris, Tiburon, lubricator; J. L. Morris, S. F., lubricator; J. E. Brown, Ferndale, animal poke.

Oregon.—John H. Peterson, Portland, sewing machine.

Washington.—Geo. A. Miller, Colfax, apparatus for excavating wells, etc.

Note.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible by mail for telegraphic order. American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

SAW-FILER.—Andrew G. Phillips, S. F. No. 494,487. Dated Mar. 23, 1893. This is one of that class of saw-filers in which a suitably guided reciprocating frame carries an adjustable connected file. The object of the invention is to provide a saw-filer the frame of which can be adjusted in order to place and guide the file at any desired angle, said file being so mounted that it can itself be adjusted vertically and lengthwise, and to the desired pitch, being regulated in its operation by suitable gauges and indicating devices to cut each tooth equally and to the proper angle and depth.

APPARATUS FOR DISTRIBUTING WATER FOR IRRIGATION.—Frederick W. Barkhaus Jr., Wrights, Santa Clara Co. No. 494,455. Dated March 23, 1893. This consists of a series of communicating tanks having each a vertical series of corresponding outlets, each series being adapted to discharge into its own channel, and a vertical series of separately controllable discharges for the communications of the tanks, so located with respect to the outlets as to distribute the water from each tank through the equivalent outlets in the vertical series of each. The object of this invention is to provide an apparatus for irrigating purposes in which the water may be equally distributed throughout a given area and its distribution regulated and adjusted to the amount of initial supply. It is applicable in all situations, but is especially adapted for use on side hills.

CASH REGISTER AND INDICATOR.—Edward T. Taylor, Oakland, Cal. Dated March 23, 1893. No. 494,534. This invention relates to improvements in cash registers and consists of rotary drums having spirally arranged rows of figures around the periphery, and indicators which are advanced by crows so that their side movement coincides with the advance of the figures upon the drums, and the whole amount received during a day or other period can be ascertained at a glance. The rotation of the drums is effected by depression levers and gearing connecting the levers with the drums, and the distance to which each lever is depressed is regulated so that the drum will be rotated to show an addition corresponding with the amount marked upon the key of the hand depressed. Locking plates permit the movement of more than one key at a time, and other mechanism insures the unlocking and opening of a cash drawer to receive the amount collected. In connection with these devices are a series of indicating plates which are thrown up into corresponding openings whenever a key is depressed, to show the amount received.

Market Reports.

The Markets.

SAN FRANCISCO, April 6, 1893.

COPPER—In the copper market there is evident a general feeling of apathy, not alone on the part of consumers, but of producers as well. Plenty of Lake is to be had at 11¢ and some ingot copper stored in New York might be had a little cheaper. Casting copper must still be quoted at 10½¢ to 11¢, according to quantity and quality, while Arizona refined copper is held at about 9¢ to 9½¢. Furnace material continues to be rather scarce, although, in Butte, that the Anaconda and St. Lawrence mines have commenced hoisting ore at an average rate was correct.

In Europe the demand is decidedly better than here. In the forepart of the week values of G. M. B.'s declined to £45, but closed firmer at £45 10s for spot and £46 for three months' prompt. In contrast with the good demand for fine and best-selected brands of copper is the fact that unrefined and common tough are offered in excess of requirements.

Coinage.

The coinage of the San Francisco Mint in March was as follows:

Descriptions.	Amount.
Double eagles.....	\$1,000,000
Eagles.....	250,000
Half eagles.....	400,000
Total.....	\$1,650,000
January.....	3,100,000
February.....	2,640,000

Since Jan. 1st.....\$7,390,000
Same time in 1882.....7,036,189

Increase, 1893.....353,811
The total for the same time in 1891 was \$11,173,556.

Silver in March.

MANUFACTURERS FOR THIRTY-THREE YEARS.

CALIFORNIA WIRE WORKS

OFFICE, 9 FREMONT ST., SAN FRANCISCO, CAL.

LOS ANGELES AGENCY, LOS ANGELES, CAL.

PORTLAND AGENCY, PORTLAND, OREGON.

WIRE ROPES

For Mining, Hoisting, Transmission
of Power, Etc.

WIRE CABLES

For Cable Railways, Etc.

WIRE RIGGING

For Ships, Derricks, Etc.

WIRE of all kinds

Best Steel.

WIRE NAILS,

BARBED WIRE,

Regularly Licensed.

HALLIDIE'S PATENT WIRE ROPEWAY

FOR THE RAPID AND ECONOMICAL TRANSPORTATION OF ORE AND OTHER MATERIAL.

Erected by us during the past Fourteen Years in Spans of from 200 to 2000 feet. Simple, Economical and Durable Have been Thoroughly Tested in all Parts of the Country

SEND FOR ILLUSTRATED CATALOGUE.

UNION IRON WORKS,

CORNER FIRST AND MISSION STS., SAN FRANCISCO, CAL.

MANUFACTURERS OF

MINING AND MILLING MACHINERY,

Automatic Cut-Off Engines, High-Speed Engines, Hoisting Engines, Quartz Mills,
Manty Chili Mills, Rolls and Concentrating Machinery, Dodd Sigmoidal Water Wheel,
PUMPS (Cornish and Other), Copper and Lead Furnaces, All Classes of Marine Work,
SHIP BUILDERS, BUILDERS OF U. S. WAR SHIPS. HYDRAULIC LIFT DOCK.

NEW YORK OFFICE, 145 BROADWAY. Cable Address, "UNION."

NOTICE TO GOLD MINERS!

SILVER-PLATED AMALGAMATED PLATES

For SAVING GOLD!

IN QUARTZ, GRAVEL, OR PLACER MINES. MADE OF BEST SOFT LAKE SUPERIOR COPPER

AT REDUCED PRICES.

Our plates are guaranteed, and by actual experience are proved, the best in weight of Silver and durability. Old Mining Plates Replated. Bought, or Gold Separated. THOUSANDS OF ORDERS FILLED.

SAN FRANCISCO NOVELTY, GOLD, SILVER, AND NICKEL PLATING WORKS,
68, 70 & 72 First St., San Francisco.

SEND FOR CIRCULARS.

JUSTINIAN CAIRE, Agent,

521 & 523 Market St., San Francisco.

—DEALER IN—

Assayers' and Mining Material.

—MANUFACTURER OF—

BATTERY SCREENS AND WIRE CLOTH.

Agent for HOSKINS'

HYDRO-CARBON ASSAY FURNACES.

IMPORTANT TO GOLD MINERS!

SILVER-PLATED AMALGAM PLATES for SAVING GOLD

In Quartz and Placer Mining.

PRICES GREATLY REDUCED. ONLY REFINED SILVER AND BEST COPPER USED. OVER 5000 ORDERS FILLED. TWENTY MEDALS AWARDED. Old Mining Plates can be Replated. Old Plates Bought, or Gold Separated. These Plates can also be purchased of JOHN TAYLOR & CO., Corner First and Mission Streets, San Francisco.

SAN FRANCISCO GOLD, SILVER AND NICKEL PLATING WORKS,

E. G. DENNISTON, Proprietor.

658 & 655 MISSION ST., SAN FRANCISCO, CAL.

Our Plates have been used for 25 years. They have proved the best. We adhere strictly to contract in weight of Silver and Copper.

An Automatic Safety Stop.

The automatic safety stop illustrated on this page can be attached to any Corliss governor, in any position, so that the lever of the stop supports the weight of the governor. The stop is controlled by the motive agent of the engine and adapted to support the governor sleeve when the motive agent is shut off. Fig. 1 of the engravings is a side elevation of the improvement as applied. Fig. 2 is an enlarged transverse section of the same on the line 2-2 of Fig. 1. Fig. 3 is an enlarged view of the face of the stop. Fig. 4 is a transverse section of the same on the line 4-4 of Fig. 3.

The engine *A*, of any improved construction, is provided with the usual governor *B*, or any other governor, connected with the valve mechanism of Corliss type of engine or with the valve stem of throttling governors, so that further description of the same is not deemed necessary. The governor *B* is provided with its usual sleeve *C*, adapted to rest on a stop preferably made in the shape of a lever *D* when the steam is shut off by the engineer. When, however, an accident happens to the governor while the engine is running, the stop *D*, being from under the sleeve *C*, permits the governor to drop sufficiently so as to completely shut off the steam from the engine.

It is understood that the stop lever *D* supports the sleeve when the steam is shut off by the engineer closing the valve; then the valves of the engine are still in position to take steam as soon as the engineer again opens the

through the pipe *G* into the tube *F*, the latter swings outward at its free end as shown in dotted lines in Figure 3, thus exerting with this free end a pull in the extension of the lever *D*, whereby the latter swings from under the sleeve *C*, to permit the latter to drop below its normal

RICHARDS' IMPROVED LOCK-NUT.

governor in the proper position for starting the engine. The Parke & Lacy Company act as agents for this device.

An Improved Lock-Nut.

A lock-nut invented by George O. Richards of Sisson, Shasta county, which is illustrated on this page is a radical departure toward simplicity of form and apparent effectiveness. The nut really consists of a coiled spring, the nominal interior diameter of which is less than the diameter of the bolt it is to fit, the spring being internally threaded to fit the threads of the bolt. The coils of the nut or spring may be one or more in number and its exterior contour may be curved or angular. It may be round or polygonal and its sides may be straight or inclined as desired. The preferable form is that of an ordinary nut as shown. The thread of the nut which is adjacent to the face which enters first on the bolt is made of a slightly larger diameter than the other threads, so that at its entrance thread the diameter of the nut is large enough to permit it to be entered upon the bolt end; or the end of the bolt itself may be slightly tapered. Then by screwing the nut it will expand and feed itself upon the bolt, fitting very tightly thereon so that it will not be jarred loose.

This is designed to be used upon the outside of an ordinary nut to be locked and effectually prevent it from working off the bolt, especially on bridges, wagons or cars where the plain nut tightens against the wood-work and the vibration is great. It finds also a ready application on fish-

position in case of accident to the governor. As soon as the motive agent is cut off from the pipe *G*, by closing the valve in the inlet pipe to the cylinder, then the tube *F* is relieved of the pressure of the steam and consequently its free end contracts so as to move the lever *D* back to its

AUTOMATIC SAFETY STOP, AS APPLIED TO CORLISS ENGINES.

valve to start the engine. This stop lever *D* is controlled by the motive agent, and for this purpose the following arrangement is made: The lever *D* is fulcrumed within a casing *E*, attached to the support of the governor, as plainly shown in Fig. 1. The lever *D* is provided with an extension pivotally connected by a link with the closed end of a spring tube *F*, preferably bent in the shape of a segment of a circle, as plainly shown in Figs. 1 and 3.

The spring tube *F* is arranged within the casing *E*, and is connected at its open end with a pipe *G*, leading to the supply pipe or other part of the steam chest, so that the motive agent can enter the said pipe *G*, whenever the valve controlling the inlet of the steam through the inlet pipe is opened.

Now it will be seen that when the motive agent passes

normal vertical position, as illustrated in Figure 3, to support the sleeve *C* in a normal position.

It will be seen that while the engine is running, the lever *D* is swung from under the sleeve *C* by the pressure of the steam in the spring tube *F*, so that in case of accident to the governor *B*, the latter can drop sufficiently to throw the cams on the knock-off levers into action, so that the steam hooks cannot catch and open the valves, thus cutting off the steam supply and thereby stopping the engine.

When the engine is running normally and the lever *D* has swung from under the sleeve *C*, as above mentioned, and the engineer shuts off the steam from the supply pipe, then the lever *D* swings back into its normal position before the engine comes to a stop, so that the lever *D* is ready to receive and support the sleeve *C*, thus holding the

plates of rails. This can be used as a lock-nut by itself and without the ordinary nut, since it locks itself securely in the place where it is left after being screwed up. Its formation is such that it is expanded when screwed on and its spring-like compression keeps it in place so that vibrations cannot readily jar it from its position. There is no great degree of expansion but enough to make the spring, of which the nut itself is formed, grip tightly on the bolt. The inventor has assigned an interest to R. A. Shade, of Sisson, and J. N. Vannoy, of 1029 Laguna street, San Francisco, owner of a third of the patent who handles the interests of the other parties. It is the intention to have these manufactured on a large scale in the East. The device is quite simple in character and appears to be effective for the purposes for which it was designed.

Comment.

There are a good many low-grade gold ledges scattered here and there over the State of Nevada, but little attention has been paid them heretofore because silver was the first attraction and low-grade gold ore was not looked upon as profitable. It is more expensive mining in Nevada than in California, but of late years we have got the business down to a very fine point here on gold ore and our Nevada friends might profit by our experience and open their gold claims. "Gophering," however, is not the way to do it. The mines must be properly opened and economically managed. Comstock methods would be disastrous with a low-grade gold proposition. It is only by strict economy and care that such claims can be made to pay, but there is no discount on the product, and every dollar's worth of metal is really worth a dollar.

The most famous gold-producing mine in California is the Idaho of Grass Valley, which has produced about \$12,000,000 and paid nearly \$5,500,000 in dividends. There are only 3,100 shares in the mine and this month the 273d consecutive dividend was declared, the last dividend being \$3 per share. At the meeting of the directors this month, Mr. Edward Coleman, who has acted as superintendent since 1865, resigned his position, and Mr. Eugene C. Oreller, who has been with the mine since 1870, and was the amalgamator, was chosen superintendent. During Mr. Coleman's superintendency, the mine has yielded upwards of \$11,000,000. After a trip to the World's Fair he will come to San Francisco to reside. It was due to Mr. Coleman that machine drills were introduced at the Idaho, and he was also instrumental in bringing in the water-power system. It is seldom that one hears of a man sticking so steadily to a mine—even a good one. The mine has been carefully and intelligently managed all these years, as its record shows.

It looks very much now as if the next mining "excitement" would be up in British Columbia, in the Slokan country and Kootenai region. A great many miners are looking in that direction and there is much inquiry for detailed information. This will doubtless result in the development of a great amount of new territory, as prospectors will not content themselves with staying in the main camps, but will scatter over the whole region. A number of California men have already gone to British Columbia to examine properties or take charge of them. The Northwest expects this year quite an accession to its mining population.

THE Leek mine, in Yavapai county, Ariz., is said to be showing up the greatest silver strike west of Aspen, Colo., the ore running over 1000 ounces on a 3½-foot ledge.

To Obtain Gold Mining Laws.

A mining congress will be held in Salt Lake City, Utah, on Sept. 11th. It is designed to have all kinds of mining discussed by this body, and all matters relating to any kind of mines read and printed for use all over the United States. It is proposed to have papers read by eminent mining engineers, but this is done every year by the American Institute of Mining Engineers. A more practical idea, to our mind, would be for a mining congress to take up the subject of the mining laws, rulings of the department, etc., and appoint a good strong working committee from the various States to formulate some plan by which the laws could be intelligently overhauled and put in shape. At present the rulings of the Secretary of the Interior and the Land Office seem to have taken the place of the general laws or to have perverted them. The laws themselves are crude in form and contradictory or obscure. The whole thing is very unsatisfactory to the entire mining community all over the United States.

The senators and members of Congress who have "tinkered" with the mining laws since 1872, have worked in the dark with insufficient knowledge of the subject. None of them have done any good for the mining industry. Senator Stewart seems to be looked upon as the only one with any knowledge of what the miners want, and his bill, which has been pending several seasons, is very unsatisfactory, indeed, doing great injustice to several branches of mining.

Its provisions, as far as they relate to drift gravel mines and the petroleum industry, if carried out, would practically annihilate both these branches. The objections have been brought to his attention, but he has not seen fit to make the desired changes. Altogether his attempt to formulate a mining law to take the place of the Act May 10, 1872, is eminently unsatisfactory.

The miners themselves have never organized to bring to the attention of Congress what they want. A Mining Congress would be in the position to ask for what miners need and do it intelligently. This could not be done in two days, but a carefully selected committee could formulate a general law which Congress would pass. This is much more important than the reading of papers by mining engineers or the passage of resolutions about free coinage. This latter question has occupied almost the entire time of previous mining congresses. It has got into politics now and out of the hands of the miners. Let the miners confine themselves to questions affecting the entire mining community, and their demands will be heeded. They could call forcible attention to the absurd department rulings and judge-made law which injure their industry and Congress would give them some relief. They will never get it until they ask for it and individual petitions count for nothing. It takes organization to accomplish anything in these days. Witness the result of the work of the California State Miners' Association on the hydraulic mining subject. The companies had been fighting for their rights for years with no result. When, however, they all combined and perfected an organization of some 4,000 or 5,000 men, both Congress and the State passed laws affording them relief. The same thing can be done with the general mining laws, if the miners hand together and tell Congress what they want.

California Gold Mines.

There is more money being paid out at Nevada City now by the various mining companies, than at any period during the past ten years, and the indications are that the payrolls will be largely increased in a very short time. This statement is made on the authority of the Nevada City Transcript, and is worthy of more than passing notice, because the region around Nevada City and Grass Valley is the center of the gold mining industry in this State. With increasing prosperity there it ought to follow elsewhere. This is one of the signs we have been expecting of a revival of interest in gold mining in California. It is bound to come, for nowhere else in the United States is there a gold-bearing belt of such magnitude and possibilities. With silver, lead and other metals in a depressed condition, mining capitalists are turning their attention more to gold properties for investment. Of course Colorado, Montana, Utah, Oregon, Arizona and Idaho have more or less gold mines, but the aggregate product of all these does not nearly reach that of the mines of California. California is still the leading gold producer of the Union, notwithstanding the comparatively light yield of recent years, caused by the total stoppage of the hydraulic gravel mines.

The gold belt of this State extends from Siskiyou to San Diego. In certain portions of the belt the developments have been more extensive than in others, but there are possibilities along the whole line. In the southern portion of the State interest is now turned more to mining

than it has been and capital is opening the properties. In the extreme northern portion, too, in Shasta, Siskiyou and Trinity counties particularly, more mining is being done than ever before. In the older mining counties there is renewed interest, as the news from Nevada county indicates. Preparations are being made to rehabilitate many of the old hydraulic mines, and though little can be expected from them this year under the new legal conditions, in time they will add materially to the gold yield.

Everything points to a general renewal of interest in the gold mines of the entire State. Gold mining is one of the industries of California which has been comparatively neglected for some years, but outsiders are now coming in and they will do what our own capitalists have failed to do—invest in gold properties.

Foundations on the Water-Front.

Engineers and architects have been much interested in the subject of the proper foundations for large buildings along the water-front of this city. It has been a problem only brought up of late years when more substantial structures became necessary. The old wooden houses which were built before the seawall was constructed stood well enough on the piles or "fills," but they had slight weight. But in the new era now upon us better buildings are demanded for warehouses, offices, stores and depots. Most people have heard of those pioneer days when "the water came up to Montgomery street," but few realize that all of the city below that street extending to the seawall is upon made land. Below Sansome street it is necessary to have pile foundations for all large buildings, and the further one goes toward the bay the softer becomes the bottom, for it is really the hay-mud. Everything is filled in now to the seawall, but outside of that the mud is very deep and unusually long piles have to be used. The deepest mud is off Howard-street wharf, but at the ferry slips, foot of Market street it is considerable distance to hard-pan.

The new ferry depot at the foot of Market street, for the construction of which the State has given the Harbor Commission permission to issue bonds for \$600,000, will all be built outside the seawall, its inner or shore edge alone resting on the wall. Experiments have been made by Chief Engineer Howard C. Holmes of the Harbor Commission, to establish the character of the material on which the foundations of the building must rest. Piles are to be driven and cut off twenty-six feet below the city base line, and on these are to be placed the concrete piers forming the foundation for the depot. In February a pile sixteen inches in diameter at the largest end and eight inches at the smallest and ninety-two feet in length was driven in the space occupied by the approach to the new ferry slips. The conditions were as follows: Distance from top of pile to mud line, nineteen feet, said top being three feet below city base, making the end of the pile ninety-five feet below city base and seventy-three feet in the mud. The last fall of the piledriver hammer was twenty feet and the pile was driven three inches. The weight of the hammer was 2900 pounds. A platform four and a half feet wide by twelve feet long was built around the pile and loaded with pig iron to the extent of 90,000 pounds, or forty-five tons. After a twenty-four hour test, comparison levels were taken, with the sea wall as a basis of operations. No perceptible change had taken place. The first pile tested was only sixteen inches in diameter, while eighteen inches is the size to be used when the work is done; the test was only ninety-five feet below city base and seventy-three feet in the mud, while the plans and specifications for work call for 106 feet below the city base line and eighty feet in the mud. The conclusions reached from these experiments are that the pile foundations for the concrete piers to support the building, will successfully answer the purpose. Many thousand piles will be used on the foundation and will be very expensive. The funds for this will be furnished by the commission, and will not come out of the \$600,000, as this sum will be devoted to the depot building proper.

Dredging California Rivers.

Liverpool is removing the bar at the mouth of the Mersey river with an immense suction dredger, which is, in fact, a large steamer having hoppers to hold 3000 tons of sand. Two centrifugal pumps with suction and discharge pipes, driven by powerful engines, lift the sand and water and deposit it in the hoppers, the water flowing off and leaving the sand. When loaded the dredger steams outside with her own power and propellers, and the contents of the hoppers are discharged into the deep waters of the ocean. The Call of this city thinks a dredger of this type would keep pace with the hydraulic tailings in California and could be used to dredge our rivers, as the large one described has a capacity of raising 4000 tons an hour, or 96,000 tons in 24 hours. These figures are misleading, however, since even if the pump can raise 4000

tons an hour the hoppers of the dredger only hold 3000 tons, and it would take several hours longer for the vessel to make her trip to discharge than it would take to load. Depending on the distance to the discharging point, she might not be able to make more than three or four trips a day, which would cut down the total daily dredging capacity very materially.

But it is doubtful if a suction dredge could properly handle the material in the California rivers under the existing conditions. A machine of the Liverpool type could not be used since she must have a deep place to deposit her load, and it would not pay to move material from one point and deposit it elsewhere in the same river. There is nothing to be gained by that. The plan would answer in the bay with an ocean outside for a dumping ground, but the conditions differ in the rivers. Moreover there is a limit to the height above the water surface at which centrifugal pumps can lift as a deposit material dredged. In the Liverpool instance the dredgings are only elevated a few feet above the surface of the water and dumped into a hold which is below surface level. In the case of the rivers the dredgings would have to be forced through a pipe out on to the adjacent lands. If the banks of the river were high this could not be done with the suction type of dredger. Where there are low banks it is possible, of course, and the dredgings could be forced away laterally a mile or more. But the river bottoms are formed of hard compact sand intermingled with rocks, roots and all sorts of stuff, difficult for a suction dredge to handle. In soft mud, with a low lift, the suction dredges answer admirably, as we are illustrating daily at Oakland, where there are now three of this type at work, two on government harbor contracts and one on a city contract in the lake.

But when the material to be dredged is compact sand, clay or other "stiff" substance, the endless chain and bucket dredge answers better than the suction type. The sand can be elevated to a hopper and thence discharged through a pipe to a distant point, water being added in the hopper to assist the flow. It is probably this type of dredge which would have to be used on our rivers to remove the debris from the beds. It is doubtful, however, whether any very extensive dredging would be done in the California rivers except at such points where large deposits have accumulated and formed shoals. Dredging is a costly operation at best. Before any would be commenced, it would be necessary to build dams above navigable points to keep the debris now in the rivers from coming further down.

The different types of dredge designed and built in California are as good as any in the world. The dredging machinery which did the best work on the Panama canal was designed and built in this city at the Golden State and Miners' Iron Works. The suction and bucket types in use here are very efficient, and reflect great credit on their designers and builders.

Foundry Notes.

The Risdon Iron Works have recently sent several Bryan mills to Mexico, and report quite a demand for this special make of roller mills from different parts of the coast. Their business in this line has increased largely of late showing an apparent improvement in the quartz mining industry.

The housed-over hulk of the burned steamer Eastern Oregon, was towed down from Seattle in 5½ days by the steam collier Willamette. The Eastern Oregon was taken to the Union Iron Works, where she is to be rebuilt. The vessel caught fire on the night of December 1, 1891, while on the dry dock at Olympia, on Puget sound. The fire was caused by burning fat in the galley. For a long time afterward it was hardly thought that the wreck was worth repairing. About two months ago experts pronounced the hull worth handling and the hulk was ballasted and housed over with a top like an inverted V. The Willamette was only a day and a half longer with the Eastern Oregon in tow than on her regular trips. The Eastern Oregon was formerly the steamer City of Palatka and ran on the coast of Florida. She registers 577 tons net, and was built at Chester, Pa., in 1883. The dimensions are: length, 200 feet; beam 34½ feet, and depth of hold, 11.9 feet. The Union Iron works have quite a job on hand to repair and again fit the vessel for sea.

Mr. Irving M. Scott, of the Union Iron Works, who has returned from Washington, though he thinks it will be a year before any more large ships are provided for, is of the opinion that the administration will continue the policy of building up our navy. He says Secretary of the Navy Herbert, by reason of his long experience as chairman of the Committee on Naval Affairs, is the very man to take up the work so nobly begun by Secretary Tracy. Mr. Scott says: "Shipbuilding of to-day and a quarter of a century ago are very different. We in the business have great trouble in selecting designs and materials by reason of the fact that so many experts disagree as to the best

and most lasting style of architecture. But the vessels we have would be hard to improve upon. Some few mistakes may have been made, but, on the whole, every member of the white squadron will answer the purpose for which it was built. Since the Monterey has been set afloat, we have proven that good ships can be built here on the coast, and I believe that the policy of the new administration is to divide the work as fairly as possible. Shipbuilding here should be a matter of State pride, and I am more than pleased with the outlook. The Atlantic coast will no longer have a monopoly in the business. The naval authorities are familiar with our facilities here, and I sought to impress upon them our claims to their consideration in the distribution of public moneys. This affects the masses more directly than the distribution of public patronage. Mare Island will receive attention, and the people should lose no opportunity to impress upon the Congressional committee, which is about to visit the coast to look for a new harbor, the need of placing the forts we now maintain in a good condition. We can get appropriations if we go after them, and need not expect help unless we ask it. I do not think that the administration will be so miserably as some may expect."

A Huntington mill was shipped last week to De Lamar, Idaho, and another to Ophir, Placer county. Mr. Frank A. Huntington, the inventor and manufacturer of these mills, was the first man to bring the roller type of mill into general practical use and to prove its efficiency as compared with stamps. He had up-hill work for a long time as there was a general prejudice against all quartz-crushing appliances except stamps. It took him several years to prove that he had a good, practical machine which could compete with stamps. The prejudice once removed, however, Mr. Huntington found he had built up for himself a fine business which has since continued. His mills are now in use all over the world, and other inventors have followed his lead in perfecting various forms of the roller type of quartz mill. The record of the cheapest milling of gold quartz in the world—that of the Spanish mine, Washington township, Nevada Co., in this State—is held by the Huntington mill; and the record of the cost in that case is far below any ever made with stamps.

THE MINING CONGRESS.—It has been decided to postpone the Mining Congress at Salt Lake from June 5th to Sept. 11th to 14th inclusive. This postponement was made because of the holding of the Trans-Mississippi Congress at Ogden on April 14th and there not being time after that to communicate with the Governors in the States and have the appointment of delegates made, since many of the Governors will be in Chicago at the World's Fair in May. Besides, there would not have been time for the preparation of papers on mining subjects of all kinds by the best-known mining men of the country, as desired. It is expected also that eminent mining men from all parts of the world will visit the World's Fair, and they will be invited to prepare papers for this Congress, thus putting an international character on the meeting.

THE English, Scottish and Australian Chartered Bank has failed with liabilities amounting, it is said, to £8,000,000 or \$40,000,000. No estimate of assets has yet been made, but they are supposed to be large. The suspended bank has main branches at Sydney, Adelaide, Brisbane and Melbourne and at various lesser points in the colonies of New South Wales, Victoria and South Australia. It transacted a banking and exchange business between Great Britain and the Australian colonies and had large deposits. The failure has added to the anxiety and consternation which previous recent failures of financial institutions with Australian connections have caused. Doubtless many miners have suffered from this failure.

GEORGE W. IRVIN, Mineral Land Commissioner from Montana, has returned from Washington to Butte and speaks of the friendly feeling of Hoke Smith, Secretary of the Interior, toward the people of the Northwest in their fight for the preservation of their rights on the mineral land question. Secretary Smith has requested Irvin to prepare an exact statement of the situation for the information of the department, fully explaining the questions involved. Mr. Irvin says he is convinced that the people of Montana and other mining States have a friend in Secretary Smith, and that the valuable mineral lands lying within the sections of the Northern Pacific Railroad will be preserved to the miners of the country.

Two prospectors arrived at Phoenix, A. T., on the 1st with \$700 worth of nuggets found by them in the new diggings, said to be located about thirty miles west of Harqua Hala, in Northern Yuma county, Arizona. The gold is coarse, the smallest particle being worth 70 cents and the largest about \$75. The diggings are supposed to be those discovered about fifteen years ago by the famous King Woolsey, and never since found, though often hunted for. They are in a rich gold-bearing belt.

HON. R. L. THOMAS, the young assemblyman from Nevada county, was banqueted at Nevada City last week on his return home and a very high compliment paid him for his faithful service while at the legislature. The State Miners' Association had already made him a present of a chain and locket as a recognition of his services to the mining community.

CHARLES H. PEARCE, one of Grass Valley's well-known miners, will leave on the 15th inst. for Douglas Island, Alaska, where he will take charge, as foreman, of the Mexican mine for the Treadwell Mining Co. This is the third time Mr. Pearce has been employed by that company.

GEORGE R. WELLS, J. L. FLOOD AND NAT T. MESSER have gone to the Vanderbilt district, in San Bernardino county. These mines are to be listed shortly on the stock board.

Coast Industrial Notes.

THE California Bridge Co. will do the stone and brick work on the new Third Ward Schoolhouse, Oakland.

THE proposition to work the tailings of some of the Tuscarora, Nev., mines by the cyanide process is about to be taken up.

THE State Harbor Commissioners have awarded the contract for the extension of Steuart-street wharf to Healy, Tibbets & Co.

THE matter of giving a \$10,000 bonus to secure a smelter for Tucson, A. T., to parties who contemplate erecting one at Red Rock, is being considered by the Board of Trade of that city.

THE chains used in anchoring the sectional dry docks at Mare Island Navy Yard, have been in the mud for over thirty years, but when hoisted this week appear to be just as good as new.

UNDER the new road law of the State, the Mendocino county Supervisors have let road-building contracts amounting to upward of \$100,000. They will also build a number of bridges.

TWO CARS of the new Alameda electric road have arrived. The trolley wires have been stretched, and all that now remains to be done is some work on the motor and power-houses on Webster street.

FRESNO COUNTY expects during the coming season to ship more than 7000 carloads of produce to market, including green and dried fruits, wine, lumber, wool and grain, to the value of \$12,000,000.

A DEPOSIT of fine building stone of a pale green color has been discovered six miles northeast of Tehachapi. The stone takes on a high polish, and whether polished or in the rough is said to present a beautiful appearance.

THE new boilers have been put on board the Monadnock at Mare Island Navy Yard. The military mast has been stepped. It has two "tops," the lower one of which is reached by an iron ladder leading up through the mast.

WEALTHY LUMBERMEN of Mendocino and Humboldt counties have formed a combination to control the redwood output. These counties furnish most of the redwood of the State, but lately the millmen have been making no money.

COLONEL A. L. CONGER, of Akron, O., a well-known manufacturer, says, after a talk with Secretary Carlisle, that the Administration in revising the tariff law, intends to cut off entirely the duty on tin plate as speedily as possible.

THE Board of Public Works of Oakland has awarded the contract for furnishing stone for the new school buildings to the Farwell Stone Co. Thus, an Alameda stone will be used. The Sites Sandstone Co. bid for this contract but did not obtain it.

THE fisherman on the Columbia are dissatisfied with the prices for salmon. They refuse to deliver for four and a half cents a pound, and a few canneries which pay five cents are getting all the fish. Twelve canneries are getting nothing from the fishermen.

FROM Portland to Spokane, a distance of about 400 miles, an overhead telephone line is to be built, and to this line, two-thirds of which will be owned by the Inland Telegraph and Telephone Company, the Pacific Telephone and Telegraph Company will contribute.

THE steam dredger at work on Lake Merritt has completed filling behind the boulevard wall on the east side of the lake and will move over to the mouth of the main lake sewer in a few days. Preparations for dumping rock on the northern section of the boulevard are progressing rapidly.

THE steel and iron work for the Third street bridge at Napa arrived on Saturday morning from the East. There has been much delay in the manufacture and shipment of this structure and when it did arrive a public demonstration was made by the blowing of whistles and firing of cannon.

IT will cost \$1000 to repair the \$18,000 bridge at Eel river, near Round valley, Mendocino county, displaced by recent high waters. The Doe Hunt Co. of this city built the bridge two years ago, with a \$30,000 indemnity bond with a five years guarantee. The courts will decide the question of responsibility.

RATHER than widen Pine street and maintain lights for the benefit of the city of Oakland, which were two of the conditions required by the Council for an extension of time for completing the Twelfth-street electric road, the owners have concluded to double their force and complete the construction within the limits of the old franchise.

MINE No. 2 at Cle-elum, Wash., has turned out a block of coal 24 feet long, 5 feet 8 inches wide and 4 feet 8 inches high, and which weighs in the neighborhood of 41,000 pounds, or nearly 22 tons. It is encased in planks with heavy iron straps, which it is thought will preserve it intact during transportation to Chicago where it is to be exhibited.

A LINE of OMNIBUSES has been started on the water-front. The route is from the ferries at the foot of Market street along East street and the seawall to Meiggs' wharf, at the foot of Powell street, then along Powell street to Bay street and back along the water-front, striking the seawall at section 2 and continuing along East street to the ferries.

ARTICLES are prepared in San Diego for a new gold mining company, with \$500,000 capital stock, to operate on the unoccupied portion of Csdros island, in Mexican waters, about half way down the Lower California coast. Chicago and San Diego people are interested in it, those from San Diego being Colonel William Denton, James Vernon, H. A. Howard, George Neale, George Foster and George Fuller.

By the terms of the contract for the erection of the great copper smelter at Salt Lake City, the smelter plant and re-

finery shall cost \$500,000; the construction of works shall commence immediately and must be completed and in operation by the 1st of January. The citizens give a bonus of \$100,000 and 160 acres of land to secure this smelting plant for Salt Lake.

The lathers of this city quit work about a week ago because the plasterers refused to grant them an advance in wages from \$1.25 per 1000 laths to \$2.25 per 1000. About 100 lathers are out, and the work on several big contracts has been considerably delayed. At a meeting this week the plasterers passed a resolution declaring that the section of the lathers in asking an advance of \$1 per thousand is uncalled for and not within the ability of the employers to grant.

THE Truckee Republican of April 5th says: The contract for cutting 20,000 narrow-gauge ties was let yesterday by the Pacific Lumber and Wood Company to Frank T. Meloche and Morris Franzini. Work will commence next Monday. This gives immediate employment to a large number of men. The ties must be cut ready for hauling by the first day of June, and will be hauled as rapidly as they are cut. This is the first work done on the new railroad and marks an era in the prosperity of Truckee.

THE San Francisco Supervisors, at their last meeting, passed a resolution putting the electric-light companies on the same plane as the gas and water companies—that is to say, establishing the fact that the city is entitled to a schedule of rates. This measure affects not only the city, but private consumers of electricity. Supervisor Day smiled suggestively when asked what the demand on the electric-light companies meant. "This merely in the same line as the gas or water matter," he said. "We have merely asked them to make a return before May 10th of the data necessary to enable us to arrive at a conclusion as to the proper charges for electric lights. Our right to do this is undoubted."

THE Harbor Commissioners have had under consideration for some time the extending of the belt railroad from Broadway along East street to the foot of Clay. This would complete the line to Meiggs' wharf, as the railroad is already in operation along the seawall from Broadway to Meiggs' wharf. The belt railroad is now in active operation at night for freight cars which are landed at Lombard-street railroad slip by ferry steamers. The road at present is not in operation in the daytime. Chief Engineer Holmes now has in hand an electric storage battery motor for a dummy, and if it is found to be practical and successful the State may operate a passenger line along the water-front from the Market-street ferries to Meiggs' wharf, on the belt-line rails.

THE Pacific Telephone and Telegraph Company has issued notices of intention to issue bonds to the amount of about \$600,000 in June next. This money is to be expended in the construction of a line from this city to Los Angeles, establishing direct communication. Hitbeto Los Angeles has been operated independently as the center of the southern California division. The new line will be from here to San Jose, San Juan, San Luis Obispo, Santa Barbara and Los Angeles, a total distance of 500 miles. The largest poles and very heavy wire are to be used, putting the over-head system on a par with any of the kind in the East and making it as satisfactory as the underground is in its way in the city limits. The wire will weigh 870 pounds to the mile and is to be No. 8 gauge copper. The money is also intended to provide for the completion of the underground system in Los Angeles, and to place all the wires in Oakland underground in the same way that they have been laid in this city.

THE steamship Keweenaw, the third carrier of the North American Navigation Co. to leave this port for Panama and way ports, left on Tuesday. This vessel is the first departure under the Panama contract, and her sailing is the inaugural of the complete service. The vessel carried 315 tons of wool, 65 tons of wine, 200 of flour, 300 of borax, 3 of canned goods, 10 of potatoes and 90,000 feet of lumber. The total tonnage of freight on the Keweenaw is 3360 tons, with the freight at Los Angeles. Total tonnage for the San Juan, of the Pacific Mail Co., which sailed the 5th inst., was 214 tons—a difference of 3146 in favor of the Keweenaw. The estimated value of the Keweenaw's cargo is \$178,055. Same for the San Juan about \$9059.55—this in spite of the reduction in freight made by the Pacific Mail Co. The former rates on wine via the Pacific Mail Co. to New York was 18 cents per gallon; the North American Co.'s rate is 4 cents. The difference of 14 cents represents about three-fifths of the value of the wine.

THE faculty of the Palo Alto University has recently received an addition of two professors, both men of note in the educational world. Amos G. Warner, late of the University of Nebraska, is now at the head of the department of political economy, and Frederick A. C. Perrein is now occupying the chair of electrical engineering.

Now that Comstock men have become interested in the mines at Vanderbilt, San Bernardino county, the richness of the district is recognized, and there is plenty of news published from that region.

It is not known exactly how many miners perished in the Pont-y-Pridd coal mine, Wales, but 53 bodies had been taken out up to Wednesday. The searching parties are still at work.

SUPERINTENDENT THOMAS WEIR, of the Granite Mountain Mine, Montana, has resigned and gone to Seattle to take the management of the Monte Cristo Coal and Iron Co.

THE Osceola gravel mine at Osceola, Nev., turned out a nugget worth \$772 the other day. This claim holds a record of a \$4000 nugget also.

BEN THAYER, recently manager of the Poorman properties, Idaho, has gone to Mexico to take charge of a silver mine.

The Double Standard.

TO THE EDITOR:—If two tide gauges, each of which should be liable to its own independent rising or sinking, should be fastened rigidly together, the result would be a single compound gauge of which the indications would be a compromise between what each would register singly, because neither could rise or sink alone. I think this simile gives a correct idea of what the advocates of the double standard mean, the fastening by which the two gauges are combined representing a parity fixed by legislation; not two standards, but one compound standard.

What is parity? In English, pure and undefiled, it is equality; the word has the same derivation as pair and peer. But in the case considered it means a ratio of unequal weights in which gold and silver are of equal value. But what ratio do writers mean by parity? Some evidently mean that which prevailed from some long past date until 1873; namely, 1 to 16. These men seem to be under the delusion that such ratio is a law of nature; one of them actually wrote of the "natural value" of silver; others, with greater propriety, mean any ratio established by law as a basis for coinage. There is hardly a more fruitful source of disputes than the use of the same term by those who attach different meanings to it.

In a former letter I said, "the price of gold cannot change;" that is, under the gold standard; under a silver standard the price of silver would not change. Under the double standard, gold would have a price in silver coin, silver would have a price in gold coin, and these prices would vary according to the demands of commerce, before which direct legislation would be powerless. As water seeks its level, so do gold and silver seek that equilibrium which depends on the supply and demand for each. They can not be tied together by any law, and a double standard not in accordance with commercial values must prove fallacious.

But, the silver men say, the double standard did maintain the ratio of 1 to 16 up to 1873. I deny this, both on information and on my own knowledge. Between '70 and '73 I was producing fine silver and selling it at a premium of 3 to 4 per cent above "parity," and the silver men themselves say the silver dollar was worth more than its face value when silver was demonetized. If the double standard could not keep silver down to 1 to 16 under an increased stock and supply of gold, how shall it keep silver up to 1 to 16 under a greater increase of silver production?

If the parity ratio should be established at 25 to 1, which is about the present value ratio, or at 20 to 1 in anticipation of a rise, real or relative, in silver, it would not be permanent; either gold or silver would soon be at a premium. I believe the one-sixteenth ratio was introduced by Spain. (I do not vouch for this, for I read but little history, preferring truth.) It endured for a long time with but little disturbance, no doubt, because it agreed nearly with the average supply of the two metals for coinage, a condition which no longer exists, nor can any one ratio be relied on to last for any great length of time.

But the opening of Californian gold fields introduced a disturbing element, and the effect was reinforced by the discovery of Australian gold in large quantity. The tides lag behind the moon; the hottest weather is toward the end of summer, and the full extent and effect of this vast harvest of gold took some years to culminate. Then came the silver from the Comstock, but accompanied by about half as much in gold value; that was not enough of silver to maintain the balance, but silver poured into the market from other sources, and, while it may be that it was demonetized to limit the total amount of coinage, and so check the fall in value (exchangeability) of gold, the effect of which was already felt, and threatened injury to the creditor class, yet the output of silver has increased so largely since that time that the former commercial value of the metal cannot at present be restored by anything short of checking the production, though the relative value (to gold) might be, and probably will be, increased by increased gold production, which may satisfy the silver men.

I think it is much the best to have but one standard metal in which all subsidiary money should be redeemable. Whether that metal should be gold or silver I will not say; either would serve the purpose, though silver is perhaps liable to more rapid and extensive fluctuations of value than gold. Two standard metals will always, in these active times, give trouble and open the way to unjust gains by bankers and brokers, through premiums and discounts. Even if the same single standard cannot be established throughout the world, the inconvenience and loss caused by two standards (for that is what the double standard really is, though not so meant by its advocates) is confined to our foreign trade by our use of a single standard.

With two kinds of legal tender of different commercial values, the one or the other is sure to be the commercial standard for wholesale business, and may be secured by special contract, as was done here when legal-tender greenbacks were worth 35 cents on the dollar in gold. The effect of such a condition of things is that, while many merchants are ruined by unexpected fluctuation, or by the absence of expected fluctuations, consumers suffer because the depreciated money is usually the people's money, and retailers try to fix their prices so as to cover any probable further depreciation between their own purchases and sales. Also, a large number of men find lucrative though socially unproductive occupation in exchanging one kind of money for another. In the times of cheap greenbacks a friend of mine made, or rather gained, for he made nothing, produced nothing, \$25 a day by simply buying and selling paper, gold, and silver money, all legal tender; and he was but one of several hundreds who did likewise in this city. In those troublous times such a state of things was, perhaps, unavoidable, but why should we voluntarily invoke a repetition of such a calamity, even in a lesser degree?

Probably it is not very material whether gold or silver be chosen as the standard. Having decided for the one or the other we shall have done the best in our power so far for, although it will fluctuate in value that is in its ratio of exchangeability for other commodities in general, we cannot find anything which will not do so. C. H. AARON.

India Rubber Trees.

A recent report of the Brazilian Department of Agriculture deplores the rapid destruction of what were at one time looked upon as inexhaustible forests of India rubber trees, and suggests as a remedy that plantations for the cultivation of the tree be established, showing at the same time, by statistics, the enormous profits that would accrue to the planter. In view of the fact that Central and South America, and especially Brazil, are the main territories upon which the commercial world relies for its supply of crude rubber, this official statement from the Brazilian Department of Agriculture becomes worthy of consideration.

The large tracts of rubber forests in the valley of the lower Amazon have been, up to the present time, especially profitable, because they have required the investment of no capital and the employment of but little labor. The swamp land, where the rubber tree thrives, requires no cultivation and demands no care. The tree propagates itself and grows rapidly. All that is required for the collection of a harvest is to send men into the forest to blaze the trees and place receptacles at their base to catch the milk. The causes assigned for the depletion of the forests are the greed of the lessees of the trees and the carelessness of the laborers. No tree should be blazed more than three times in one day, and great care should be taken in this so that the hatchet may not cut through to the trunk itself. If the tree is thus wounded, it slowly withers and dies. If the wood is not touched, however, the blazing of the milk-yielding bark does no harm, and one tree will produce rubber for fully 50 years. If the yield is forced, however, by too frequent demands upon one tree, the crop becomes less every year and in a short time fails utterly.

It is thus evident that an almost inexhaustible supply of rubber may be seriously injured by greedy merchants and their careless employes, for the dealer, as a rule, rents his rubber-yielding land, and cares only for the present return, with no thought of future production. Another source of injury is the poaching by the natives, who wander through the swamps of the upper Amazon, sapping rubber trees for their own benefit and selling their stolen milk to the traders on the coast.

The India rubber plant thrives only in a low and marshy country, and requires a mean atmospheric temperature of 90°. When transplanted to a more temperate climate, the tree ceases to yield milk, and becomes merely an ornamental shrub. In an equatorial climate, however, the plant flourishes, and will make a return in a few weeks for the capital invested in its early planting. The great drawback to planting is that a tree needs a growth of 25 years before it will yield milk. In a virgin rubber swamp, the tree grows among others of different species, so that one man can care for only about 150 trees; whereas, if it were planted in groves by itself, one laborer could attend to several acres, with an average of 540 trees to the acre. It is estimated that 540 wild trees yield 70 pounds of milk per day. This, when dried, gives 35 pounds of crude rubber, which is worth \$15, so that the annual yield per acre, at this rate, would amount to \$2250.

Senor Matias Romero, ex-Minister at Washington, and the Brazilian Department of Agriculture are authorities for the statement that the India rubber tree under cultivation will yield twice what can be gathered from wild trees in the swamps. This statement is based on experiments made on the plantation of Senor Joachim Antonio de Sylva, on the island of Boca Intento in the Amazon river, 12 miles above the city of Para. Here a tract of 40 acres, after 20 years of cultivation, gave a first crop aggregating \$500 per month per acre, or a total of \$20,000 for the first year that the trees were tapped. There was an interval of two months allowed for the trees to rest, so that the year really counted but ten months.

Other experiments in the cultivation of the plant have been made at Soconusco, on the boundary line between Mexico and Guatemala. Young rubber trees were transplanted by the Mexican Government 35 years ago, and they now each yield 50 pounds of milk annually. This amounts to 27,000 pounds of milk to the acre, which reduces itself to 12,000 pounds when dried into crude rubber. The average price of rubber would give a return of \$6000 per acre on this basis, which is double what is realized from the wild trees in the Brazilian swamps.

The official report of the Brazilian Department of Agriculture closes with the assertion that "neither tea, coffee, cocoa, hemp, indigo nor any other agricultural product is as profitable as rubber, the returns from the cultivation of which are almost like those of a mine in bonanza."

The great obstacle which has confronted all those desirous of fostering the cultivation of the rubber tree has been the labor problem. Almost the only human being able to work on the torrid swamp lands of Brazil is the native Indian, and he will only work a few days of the year, just enough to accumulate the few dollars necessary to sustain him. The heat and malaria kill off any white man, whether native born or immigrant, who attempts to work in the swamps, and the traders are therefore compelled to rely on the natives. The Indians know this, and for the most part go into the swamp on their own account, rob the trees of their milk, and sell it to the merchants. The Brazilian Congress has tried every means of preventing these marauders from invading the swamps, but as yet has been unable to frame any remedy.

Perhaps an easier way to establish a plantation would be to purchase a tract of virgin forest in the Amazon valley, to clear away the old trees and those of other species, and then to care for the grown rubber trees already there. Such a proceeding would take about five years only, but would cost fully four times as much as the first plan. The cost of the swamp land would be small, but an acre of wild forest would produce only one-fifth as much as an equal area under cultivation. But even \$100 net profit would make fair interest on the investment. In either of these cases certain stringent laws would have to be passed and enforced to prevent marauding natives from killing the cultivated trees in their thieving invasions.—New York Sun.

The Yukon River Region.

Capt. Wm. Munre, a pioneer of the mining camps of British Columbia and Alaska, expresses himself as follows in the *Victoria Colonist* relative to the Yukon section:

The Yukon district is a grand country for the miner and prospector, and there is an easy and feasible way of bringing it within eight or ten days' journey from Victoria, which will do away with the present serious difficulties that exist and will relieve miners going into that country of nine-tenths of their present hardships.

THE ST. MICHAELS' ROUTE.

First, the long and circuitous route by the way of St. Michaels must be done away with, as you will perceive by following that route from Victoria to the mines, how many dangers and difficulties the miners have to contend with by going that way.

The distance from Victoria by way of the mouth of the Yukon up to Pelly river is, roughly estimated, about 4500 miles, and goods and provisions going that way have to be landed on the barren island of St. Michaels, where there is neither wood nor water, and an ocean vessel has to anchor between three or four miles off shore, and, with heavy westerly winds she has to heave her anchor and stand off to sea. The ocean steamers cannot go to St. Michaels before the latter end of June or the first of July on account of the pack ice in that part of Bering sea and Norton sound. At St. Michaels the freights are transferred to river steamers and the route between there and Offen mouth, which is the northern passage of the Yukon, is exposed to the open sea with strong westerly winds, which makes it very dangerous for such vessels. This was where the Alaska Fur Co.'s steamer Arctic was wrecked in 1889, which jeopardized the lives of about 250 miners who had waited at Forty Mile creek and its vicinity for her arrival with the year's supplies.

The first consignment of provisions that the miners get are a year old, being that length of time on the journey, for they are first taken only 300 miles up the river and here the steamers go into winter quarters, and they do not continue their journey until after the breaking up of the ice, which is generally about the 26th of the following May. You can form some idea of the state the bacon and other provisions are in when the miners get them.

As yet there are

ONLY TWO STORES,

One being at the mouth of Pelly river and the other at the mouth of Forty Mile creek. The extensive territory at the mouths of Pelly, Lewes, Salmon and Hoodalinka rivers and Testle lake, and the river that empties into that lake and which drains the whole of the western slope of the Cassiar district, and where large deposits of gold are known to exist, has not been prospected only by but a very few miners, on account of their not being able to procure supplies.

It is, therefore, most desirable that something be done to render the district more easy of access, for these miners and prospectors, as, with such a vast extent of country unexplored between the Lewes river and Cassiar district—over 60,000 square miles of which is virtually a terra incognita except for prospectors and miners, lying partly in British Columbia, known to be rich in gold—it is not improbable that further rich discoveries than those already made will take place and a period of activity in placer mining set in in which "ready bullion" results greater than ever known before and a revival in the prosperous times of the good old days of Cariboo and Cassiar possibly on a 10-fold larger scale.

If this portion of Canadian territory lying close to the coast had a trail or wagon road such as I have been advocating during the past five or six years, there would be thousands of miners in that section of the country, for as it is, a number of men could not be supplied for any length of time unless there was a road made on which the miners could travel at all seasons of the year and by which storekeepers could get their stock of goods replenished at any time. Listen to what some of our eminent explorers and miners have to say about this country.

Look! says Mr. Moore, look at the consequences to the miners and country attendant upon any mishap to the steamers that supply food to the vast country. Allow me to carry you back a few years to an incident that happened. At the approach of winter in 1880, 200 men at Forty Mile creek were anxiously awaiting the supply steamer, long overdue. Flour could not be obtained in camp for its weight in gold, and bacon and beans were luxuries of bygone days. A crisis in their affairs was fast approaching, when Indian runners arrived with the startling information that the steamer was wrecked not far from the mouth of the river and no grub could come to them that winter. Work stopped then and there and an exodus to the coast began. It was stay and starve or reach the wrecked steamer and live. After a journey of 800 miles, involving incalculable suffering, Nuklukahyet, a trading post of the Tananah Indians, was reached and it was found that the steamer had been patched up and that it had arrived at that place. The supplies were in a terrible condition. The flour, which had soaked in the water, hardened and had to be beaten with clubs and put through sieves, and then was streaked with green mould, while the bacon resembled blubber. About 90 of the party took possession of the steamer New Racket, which was lying at Nuklukahyet and started for St. Michaels.

At Nulato the ice cut through the steamer, rendering her useless, so the remainder of the trip was accomplished by land, through snow and slush for 250 miles, until Norton sound was reached, about 70 miles north of St. Michaels.

You will see by the above how necessary it is that these people should have other ways of ingress and egress. They ought to have a route from the coast that would be easy to follow. All these conditions a good trail, suitable for pack trains to the Yukon river, will provide. Now, men leave Juneau in February and March to reach Forty Mile creek in June; and, going out, leave the creek late in August or

the first of September, losing several weeks of good working time—a serious loss when that working time is so short—to start for the coast.

Upon this interesting subject numerous explorers and prospectors have reported, among whom I may mention the following:

Mr. Ogilvie says: "Cassiar Bar was worked in the season of 1886 by a party of four who took not \$6000 in 30 days. They were working there when I passed in 1887, but stated all they could get that season was about \$10 per day to the hand.

"Stewart river was the first in the district on which mining to any extent was done. In 1886 there was quite a number of miners on it engaged in washing gold, and they all appear to have done fairly well. I have heard the amount of gold taken from Stewart river in 1885-86 estimated at various amounts, one being \$300,000.

"The highest amount I heard of as representing any one man's earnings was about \$6000. Many agree that \$30 per day was common on many of the bars on the river, and instances of as high as \$100 per day have been earned.

"In conversation with Mr. T. Binswell, who had prospected the Teslin, Hoodalinka or Newberry river, in the summer of 1887, I learned that the whole length of that river yielded fine gold, generally at the rate of \$8 to \$10 per day; but as the miner's great desideratum is coarse gold, they did not remain long in a country in which fine gold only is found.

"It is probable that we have not less than 1400 miles of stream in out part of the district, upon all of which gold can be found. I think it may with confidence be asserted that rich finds will yet be made of both coarse gold and gold-bearing quartz."

Dr. G. M. Dawson, of whom perhaps there is no better authority on the continent, says in an excellent and extended report on the subject:

"Without including the northern part of British Columbia, but restricting ourselves more to the great area of 192,000 square miles, situate to the north of the 60th parallel and west of the Rocky mountains, which I refer to as the Yukon district, it may be said that the information now obtained is sufficient to warrant a confident belief in its great value. Very much yet remains to be learned respecting it, but it is known to be rich in furs, well supplied with timber, and is traversed by a great length of navigable rivers. It is already yielding a considerable yearly gold product, and presents every indication of a country rich in other metals and including vast deposits of coal and copper.

In the northern portion situated between the 60th and 65th degrees of latitude is comprised an area of not less, probably, than 30,000 square miles, in the future suitable for an agricultural population, and presenting none of the characteristics of a sub Arctic region, which have, in advance of exploration, been attributed to it by some writers. The winter climate of this whole great region is known to be severe. Mining can scarcely be said to have begun in this region more than five years ago, and the extent of country over which gold has been found is very great. Most of the prospecting has been confined to the banks and bars of large rivers, and it is only when their innumerable tributary streams begin to be closely searched that gulch diggings, like those of Dease, McDane's and other streams in the Cassiar district—and possibly even on a par with Williams and Lightning creeks in Cariboo—will be found and worked. The general results so far have been to prove that six large and long rivers—the Lewis, the Testle, Big Salmon, Pelly, Stewart and White—yield fine gold along hundreds of miles of their lower courses. With the exception of the Lewis, no part of the headwaters of any of these have as yet been prospected, or even reached by the miners, and scarcely any of their innumerable tributaries have been examined. The developments made at this time are sufficient to show that when means of access are improved important bar mining will take place along these rivers. Quartz mining will undoubtedly follow, and the prospects for the utilization of this great mining region in the near future appear to be very promising.

Washington's Lumber Interests.

Census Bulletin No. 364 is devoted to the lumber and sawmills of California, Oregon and Washington. The first item of interest is the percentage of increase in the decade 1880-1890. For Washington this increase is \$1554.94 in aggregate wages paid; 1253.31 in number of hands employed; \$568.22 in value of classified mill products. These percentages are three times as large as those of Oregon or California.

In Washington in 1890 there were 311 establishments reporting, as compared with 37 in 1880. Capital invested, 1890, \$19,307,829; 1880, \$2,456,450. Hands employed, 1890, 6753; 1880, 499. Wages paid, 1890, \$3,318,796; 1880, \$200,539. Material used, 1890 (cost at mill), \$7,272,269; 1880, \$1,188,075. Product in 1000 feet sawed lumber, board measure, 1890, 981,004; 1880, 160,176. Shingles (1000), 1890, 545,297; 1880, 3610. Total mill products (value), 1890, \$13,898,504.

Doubtless it will surprise many people to be told that the value of the Washington mill product in 1890 exceeded that of Oregon and California combined. The figures were: Washington, \$13,898,504; California and Oregon, \$13,601,477; or nearly \$300,000 more. Washington also paid in wages more than Oregon and California combined, the figures being: Washington, \$3,318,796; Oregon and California, \$3,243,213.

The capital invested in Washington lumber and sawmills was \$19,307,829. This was nearly nine times as much as in 1880 and nearly equals that of Oregon and California in 1890. The greatest increase in product, of course, was in shingles. In 1880, 3,610,000 shingles were produced in Washington. In 1890, 545,297 were made, and the product of shingles in 1890 was slight compared with what it is to-day.

The contents of the whole census bulletin will be found

interesting by all who are concerned in lumber, but the most important facts are those cited above. They show conclusively not only how vast are Washington lumber interests, but that they are of vital concern to the State. Few persons not familiar already with the facts would be likely to believe that Washington alone is so far ahead of its sister States on the Pacific Coast, especially when the many uses and high prices of the California redwood are considered.

The Kootenai Country.

John Wagner of Phillipsburg, Montana, who has been some months in British Columbia, in an interview in the *Mail* says the Kootenai country has been known for many years to hunters and trappers to be a mineral-bearing one. Placer mining has been carried on for years in a crude way, and handsome returns have been gained. It was not till August, 1892, that any quartz locations were made as far as known. At that time J. W. Haskins of Revelstoke discovered what is known as the Haskins group, near the headwaters of Healey creek, on the divide between the Lardo and Duncan rivers. On account of this discovery, the Provincial Government in 1891 constructed a pack trail up the Lardo to Trout lake. The excitement occasioned by the rich strikes in Slokan district naturally drew the prospecting element toward that section during the past year, and as the district was swarming with men the past summer, a number pushed forward in a northerly direction to trace the mineral belt, which finally brought them to the Lardo-Duncan country.

On Davies creek, which empties into Kootenai lake at the new town of Lardo, large bodies of copper ore have been discovered. On Cooper creek, which empties into the Lardo a short distance above its mouth, some 50 or 60 locations were made showing ore of a high grade. The Haskins group, mentioned above, includes the Abbott, King William, Union and Stella. Assays from the surface of these claims gave from \$7 to \$20 in gold, 120 to 160 ounces in silver and a high percentage of lead per ton. Near this is the Kennedy-Wagner group, from which assays have been obtained giving from \$10 to \$30 in gold and 115 to 552 ounces in silver. About five miles to the southwest is the Orphan Boy, with an ore-body from 15 to 24 inches wide, solid galena, carrying from 90 to 120 ounces silver. The Maple Leaf carries ore assaying as high as \$200 to \$240 per ton in gold; while in the same group are the Crown Point and Beaver, similar to the Maple Leaf, and from which assays of 80 ounces in silver with high grade of lead have been obtained.

Two miles north, says the *Nelson Tribune*, and on the same belt, is the North Star group, owned by Abrahamson & Langrell. They have one vein from 15 to 20 feet wide; average assay, \$53 gold and 25 ounces silver. One mile to the east is the Silver Cup group. Here is located the Crystal, containing four feet of solid ore; value, \$23 gold and 94 ounces silver. The Queen of the Hills and Silver Cup average about the same; namely, 22 inches solid ore, from which specimens taken have yielded from 653 to 2300 ounces silver per ton.

The Leroy & Gainer group is situated on Lime creek, a tributary of the Lardo. The veins are from three to five feet wide, from which assays have been had yielding \$15 to \$20 gold and 200 to 400 ounces silver. The Poole & Crockett group is situated between the north and south forks of the Lardo river. Here, it is claimed, a ledge exists fully 80 feet wide, carrying galena and carbonates. A crosscut exposes 13 feet solid galena, assaying \$49 gold, 53 ounces silver, besides quite a quantity of lead. The carbonates in this vein assay as high as 300 ounces.

In the same vicinity is the Great Northern group, located by Downs, Holden, Walker and others. It is estimated there are 1500 tons of ore, running from \$8 to \$15 gold and from 40 to 63 ounces in silver, with a fair percentage of lead in sight on the Great Northern, and the claim has been bonded to John A. Rockefeller, the Standard Oil millionaire.

Two miles easterly from the Great Northern, on the low, grassy divide between the Lardo and Duncan rivers, are the claims of Messrs. Horne, Nagle, McDonald and Edwards. Several other persons, also, have locations in this neighborhood. The principal claims comprise the Horn Silver, King, Celtic, Canadian Girl and Iron Horse. Two strong parallel ledges exist here, one from three to four feet in width, filled with rusty galena and carbonates; average samples yielded from \$13 to \$23 in gold and 53 ounces silver, besides the lead contents. The other ledge is a contact between black slate and lime, and is from 30 to 40 feet wide, the vein matter of which is granulated quartz of a friable nature, carrying bright, hard galena and free gold. This quartz has been crushed and tested by panning—from 500 to 600 colors of gold have been found in one pan of pulp. Very conservative prospectors predict that this ledge will be the Comstock of the Lardo-Duncan camp. Eleven claims, all showing ore, have been staked on this vein.

About one mile easterly from the locations above described, near Duncan river, on the same grass-covered mountain, lies the Blackburn group. Mr. Blackburn, who is a mining engineer, with his partners, have six claims located on a ledge from five to six feet in width, carrying an ore body from two to four feet thick, assaying \$47 in gold, 90 ounces silver and rich in lead contents.

A deal of considerable magnitude would have been consummated on this ground the past fall had the depth of snow not prevented the representative of capital from reaching the claims.

Two miles westerly from the Horne camp is a group of eight claims, owned by Messrs. Livingstone, Raimey and others. The ore is similar in character to that of the Blackburn cluster. The Montgomery and Brett group is located ten miles northerly from the mouth of the Lardo river, on Glacier creek. The claims are five in number and contain large bodies of rebellious gold ores, which an

analysis proves can be successfully reduced by the MacArthur Forrest process.

Grey's galena camp is situated a short distance above, on Duncan river.

Here several claims have been secured which have similar characteristics to those above described. About six miles above the Grey camp, Messrs. Cudihee & Grey have several promising free-milling gold claims.

In this vicinity, on Eight Mile creek, is where Mr. Hirsch and companions of the provincial government surveys, found the rich gold float that caused some excitement last fall, and where they have two locations on the source of the float. Mr. Hirsch, also, has several locations of rich hydraulic diggings near by, containing coarse gold. Across the valley from the Hirsch quartz locations are the discoveries of Messrs. Reno, Sandoz and Cudihee, made late last fall. Ore brought back by them and assayed gave returns as high as \$2200 per ton in gold.

The foregoing comprises about all the information obtainable concerning the coming scene of great mining activity. It will be seen that the majority of the finds described carry auriferous as well as argentiferous galena, and that gold, quartz and placer mines will doubtless yet be a factor in the Lardo-Duncan country.

The Lardo and the Duncan rivers are only navigable for the smallest boats; but two lakes exist. Trout lake, on the Lardo, 30 miles from the north end of Kootenai lake, is 15 miles long and from one to one and a half miles wide, while Upper Kootenai lake, on Duncan river, five miles above its junction with the Lardo, is 12 miles long and from one to two miles wide.

The question now is—and it is one worthy of consideration by the business men and transportation lines on Kootenai lake—can the ore from the claims in the Lardo-Duncan country be brought down the Lardo river, thence to market by Kootenai lake, or will it go north and west and out by the northeast arm of Arrow lake and the Columbia river?

Shasta County Coal.

In speaking of our numerous resources and products, says the *Redding Free Press*, the coal deposits of Shasta county have always been noticed, but probably there are not a dozen of our inhabitants who really know the magnitude of the deposits, the quality of the coal, or who can give special or detailed information on the subject of Shasta county coal. This week we have been able to glean information from a reliable source on the subject, and will attempt in this article to give what we have learned to the public, that our readers may not only become posted but also that they may realize what the future has in store for us:

A gentleman, whose name we are not at present at liberty to use, but who, suffice it to say, is posted on the subject of coal, has made a report on the deposits long known to have existed in the vicinity of Round Mountain and on the line of the Shasta railroad. From his report we learn that the coal area is from 30 to 70 miles long and 18 miles wide, commencing at Township 31 north, Range 2 west, and running to Townships 35 and 36 north, Ranges 2 east, and taking in all of Township 35 and 36 west. Most of the explorations have been done in Township 33 one east, 34 one east and 34 one west. In Township 33 one east, Section 22, a tunnel has been made 85 feet long, which is 7x8 in the clear and all in coal. At the end of this tunnel a shaft has been sunk 100 feet, cutting through 32 feet of coal matter. The coal veins are devoid of clay or rock seams, but the seams are bituminous shale, one strata being 22 inches thick. The veins lay at an angle of two degrees, pitching south. It is estimated that at a depth of 2000 feet that the pressure will be 1000 feet.

On the other townships, between 20 and 30, different shafts and tunnels have been opened, cutting 12 different veins, the last vein cut showing four feet of coal. This vein is 150 feet below the level of the tunnel spoken of above. The largest vein cut was 22 feet. There is plenty of timber for mining, and by an incline plane the coal can be run to a railroad, in fact a railroad can be run over the land, although its altitude is from 1800 to 2000 feet. It is estimated that coal can be mined and put on the dump at a cost of 25 cents per ton. It can be mined cheaper than Wellington coal, as there is not so much waste, and can be gotten out in lumps with very little screenings. Of course this favors cheap mining. The character of the coal is lignite or semi-bituminous, and is estimated ten per cent better than any coal found in California and equal to Washington or British Columbia coal. The greater the depth the better the coal. It is estimated that this coal can be mined 20 per cent less than Seattle coal. As it lies horizontally, it shows evidence of a continuous body that will not pinch out. It is of high commercial value. It contains a trace of sulphur and is from one to ten per cent less in moisture than Wellington coal and more volatile than Seattle coal.

The expert, in his concluding remarks, says that all coal west of the Rocky mountains is lignite, and that this is of the best quality of lignite; that the seams are bituminous shale, and that deeper down it becomes more bituminous and that he considers it the best coal in California.

Besides coal, he found magnetic and hematite iron ore, granite, lime, dhalomite, blue and gray building sandstone, marble and valuable pottery clay, and it is the opinion that, with iron and coal in abundance, it will only be a question of time when steel will be manufactured in this vicinity.

The extension of the Shasta railroad will open up all these resources, and as the road continues northward it will also open up a fine body of timber—yellow and sugar pine, fir, spruce and cedar—as also tamarack groves, from the fiber of the trees of which the finest paper pulp is made. Then on to Stone Coal valley, in Modoc county, where there is another fine coal deposit, the road is sure to open up a most valuable territory.

Niagara in Harness.

No engineer ever looked at the spectacle of power displayed by Niagara falls without a feeling that it was a crime to allow the enormous energy there stored up to run to waste from eternity to eternity. The artist is content to steep his soul in the beauty of the scene, but the average utilitarian American is likely to do some figuring on horse-power and available units of work. The prophecies of years are about to materialize in a great power plant, which will utilize 100,000 of the 15,000,000 of horse-power going to waste over the falls, and \$2,500,000 has been expended and the water-wheels will be in place and the sluices will be opened.

From the early years of the ownership of the falls by the Porter family, the advantages of the great water-power were freely discussed, but nothing was done until about 1850, when Horace A. Dey caused the construction of a canal, which takes water from a point above the rapids and conducts it to a set of mills built on the banks below the falls, and now known as Schoellkopf's mills. The Niagara river makes a bend at a right angle, and the falls are at the apex of that angle. This canal forms the hypotenuse of a right-angled triangle, of which the longest side is the river above and the shortest side the river below the falls. The mills are near the falls, and are not a picturesque feature of the scenery.

The turbines which drive the mills are sunk in pits only about 50 or 60 feet deep, and consequently their tall faces discharge a hundred feet or more above the surface of the rapids below the falls, and half of the available power of the water brought down by the canal is thus wasted. Less than 6000 horse-power is utilized.

The new works have reversed this plan of a long supply canal and a short tail-race. They have been constructed on a modification of a plan first proposed by Thomas Duersted, a division engineer of the New York State canals. The plan is to have the mills on the banks above the falls, and at a distance from the scenic locality, and then to have a long tunnel to carry the waste water down the rapids.

The mouth of the canal is more than a mile above the falls. As far as constructed the canal is about 1500 feet long, 12 feet deep, and varies from a breadth of 200 feet at the mouth to 100 feet at the inner end. Along the sides of this canal and of its branches are to be built or sunk pits to a depth of 160 feet, and at the bottom of these pits are placed the turbine water-wheels. Each of these wheels has 140 feet effective head of water over it. The water is carried down to them in great pipes, seven or eight feet in diameter, called penstocks. After the water had done its work on the wheels it was discharged into the big tunnel, which runs away underground to the river below the falls. This tunnel has been the most difficult and costly part of the work so far. It was cut through solid limestone rock, but the rock was found to crumble so badly after exposure that the whole 7000 feet of the tunnel had to be bricked up. It is in the form of a horseshoe, 28 feet high and 18 feet broad, inside dimensions. Starting at a depth of 160 feet, it has a downward slope or pitch of four feet in a thousand at first, increasing to seven feet in a thousand. Its mouth, where it discharges into the rapids, is 214 feet below the brink of the cliffs which form the ravine. Its cross-section is 375 square feet, and at the speed of 20 feet a second, with which the water will rush out of it, there will be a discharge of about 50,000 gallons per minute.

And yet this enormous amount of water will not show any appreciable drain whatever on the magnificent volume of Niagara. It will lower the level of the great flood only about one and a half inches. The extent and constancy of this water-power can be understood when it is realized that the water service of the great lakes, with the land sloping into them and contributing to the falls of Niagara, has a total drain basin of over 240,000 square miles—equal to more than twice the area of Great Britain and Ireland, about 40,000 square miles more than the total area of France, and more than 15 times the total area of Switzerland. The Horseshoe falls are 158 feet high and 2000 feet wide. The other chaeon, in the State of New York, forms the American falls, which are 169 feet high at the eastern side, and 1000 feet wide, both falls comprising 3600 linear feet of water.

The extreme limits of variation in the depths of the river at different times above the falls are 3½ feet, but these limits are rarely reached. The ordinary variation is about one foot. Below the falls the extreme variation reaches about 15 feet. Generally a variation of one foot above the falls is followed by a change of level of five feet below the falls. These slight changes are of short duration, and are due mainly to long-continued or violent wind, or sudden great accumulation of ice.

The average discharge of water at the outlet of Lake Erie into the Niagara river is estimated by some authorities at 265,000 cubic feet a second. Moreover, as far as this or the next two generations are concerned, it doesn't matter whether there is any rainfall, for there are 6000 cubic miles of water backed up in the little mill-pond of the Niagara Falls Power Company, which is sufficient to run the falls in the present style for 100 years without the help of another drop from the clouds.—New York Tribune.

THE GEOLOGICAL SURVEY.—Willard D. Johnson, who is in charge of the California and Nevada division of topography of the United States Geological Survey, and R. B. Marshall, one of the surveyors, have left for Washington, D. C., under orders that are at present secret. All field parties connected with this division will be called in on or before the 15th inst., and they will be placed at work in the office. These parties have been out since June 1, 1892, collecting information for maps of this division.

A MENDOCINO BIG TREE.—Mendocino county will have a section of one of its giant redwoods at the World's Fair. G. W. Stevenson of Westport has gone to Chicago for the purpose of superintending the location of this monster trunk. The portion of the tree to be exhibited measures

12 feet in height and 77 in circumference. It was cut on Eel river. It took two of the largest saws brazed together to fell this enormous redwood, and the time required was seven days. It measured 427 feet in length and is the largest redwood ever known. Where it broke, 274 feet from the stump, it was nine feet in diameter. It will be cut into ten slabs for the purpose of transportation. With the exception of a few specimens of the sequoia gigantea, with which the redwoods have been frequently confounded, this is undoubtedly the largest tree in the world.

Platinum Ore in New South Wales.

The first discovery of platinum in New South Wales, says *Iron*, was made near Mulga Springs in some cupriferous ironstone which was being worked for copper. A report recently supplied to the Minister of Mines by Mr. J. H. Jaquet, geological surveyor, states: "I have visited the various deposits of platinum which occur in the neighborhood of Broken Hill. During the year 1889 Mr. T. B. Belgrave, M. D., of Broken Hill, sent some samples of ore obtained from the parish of Tara to the Mines Department, in order that they might be assayed by Mr. J. C. H. Mingaye, F. B. S., etc. While engaged in assaying the ore, certain unusual reactions were observed, which caused Mr. Mingaye to suspect the presence of platinum, and he accordingly made a careful examination for this metal, but found that the quantity present in the samples was too small to afford a profit after extraction.

"I have no doubt that ore carrying a small quantity of platinum could be obtained over a very wide area of the 'Barrier' district, but hitherto prospecting for this metal has been confined to two localities. Scattered over the country are superficial masses of ironstone, generally more or less impregnated with carbonate of copper, but sometimes free from this substance. It is in these deposits of ironstone, and the more or less decomposed rock underneath them, that the platinum occurs. All the superficial deposits of ironstone do not contain platinum, and no difference can be detected in the appearance of those ironstones in which this metal is present and those in which it is absent. Occasionally the ironstone is seen cropping up at the surface, but it is generally covered by shallow pleistocene and recent deposits, and trenching is necessary to cover it. The ironstone cap passes by insensible gradations into ferruginous clays below, and these clays into granules of silica, cemented together with kaolin or into a compact kaolin. It would appear from the assays that the clays and kaolin contain a larger amount of platinum than the ironstone. On the Broken Hill Proprietary Platinum Company's property some very large masses of copper-stained ironstone, which carries platinum, are to be seen. Very little work has been done to prove these deposits, and hence I am unable to give an exact account of their dimensions, etc. A specimen of ironstone, which I selected at random, yielded on assay by Mr. Mingaye: platinum, 5 dwt.; silver, 1 oz., 16 dwt. per ton, and a trace of gold. Some ironstone obtained from the parish of Sebastopol, where it occurs as a contact deposit between serpentine and gneiss, I was told had been found to contain platinum, but the samples which I took from this deposit yielded no platinum when assayed by Mr. Mingaye. I also took samples from other reported finds of platinum ore, but in no instance, other than those mentioned, was this metal found to be present. Two attempts at concentrating this ore were made under the direction of the Department at the Clyde Works, and the results obtained were very discouraging.

"The platinum deposits in the Broken Hill district differ from any previously discovered. Owing to this circumstance and certain general peculiarities in the mode of occurrence of platinum and its allied metals they possess a considerable amount of scientific interest. All commercial platinum has hitherto been obtained from alluvial deposits, where it occurs in the form of small but well-defined grains scattered through gravels, etc., over wide areas. In no respects do the Broken Hill deposits resemble these alluvial ones. Authentic instances of platinum occurring in lodes are rare. Mr. J. A. Philips mentions 'that small grains of platinum are said to have been occasionally observed in the auriferous quartz of the Beresovsk mines.' Messrs. F. W. Clarke and C. Catlett reported in 1889 'that they had found as much as 2.55 ounces of platinum per ton in some samples of nickel ore obtained from the Sudbury Mines in Ontario, Canada.'

"In the case of the Broken Hill deposits, when the copper-stained ironstone cap and the clays immediately below it are penetrated, no traces of copper pyrites or other iron and copper ores are to be seen, and so the cap is not a gossan representing the oxidized portion of ore beneath. The iron, copper, platinum and small quantities of other metals found in these deposits were probably originally carried by these springs in solution. The iron and copper were precipitated from these springs when they reached the surface, and were brought under the oxidizing influence of the atmosphere, but the platinum seems to have been partially absorbed by the kaolin, and only a portion reached the surface."

The government geologist appends the following minute: "Mr. Jaquet's report is interesting from a scientific point of view, inasmuch as the platinum deposits which it describes differ in their mode of occurrence from any hitherto known. He is of opinion that the masses of platiniferous ironstone (chiefly copper-stained) owe their origin to springs, which carried the iron, copper and platinum in solution, and deposited them on the surface. These masses of ironstone appear to have no connection with lodes, but occur capping intrusive and sedimentary rocks alike. None of the deposits have been prospected to any great depth, and in none of the samples assayed was platinum found in sufficient quantity to pay for extraction. I observe that since the date of Mr. Jaquet's report the value of platinum has declined very considerably, so that unless very much richer ores than any of those hitherto met with be discovered, it is not likely that platinum mining will become one of the industries of the Barrier."

Electricity.

Commercial Value of Electricity.

Although electricity has a commercial value next to steam power, and has been successfully applied to such a multitude of uses, one may often hear the remark that electricity is in its infancy. One would not like to think of it as in its dotage, but certainly one might think it had attained to vigorous youth, and that its swaddling clothes were quite outgrown. If by the expression is simply meant that the possibilities of the employment of electricity have not yet reached their limit, it is true in one sense, but far from being true in another sense. Prof. E. A. Dolbear, in *Donohoe's Magazine*, says: There appears to be a vague notion in the minds of some persons that electrical energy is illimitable, so that with machines more perfectly adapted to electrical laws more and more work can be done by a given amount of electrical energy. One may sometimes hear of an enthusiastic inventor who claims to have devised a dynamo or a motor two or three times as efficient as any other, or a galvanic battery which can take the place of a dynamo for extensive electrical work. It is to be remembered that in order to obtain electricity for any purpose whatever some kind of power must be provided to produce it. Steam, wind, water or chemical action are antecedents. If a steam engine of 50-horse power is made to drive a dynamo, no more than 50-horse power can possibly be got out of the electrical current the dynamo generates; indeed, not so much as that, on account of the mechanical losses unavoidable in all machines. But the dynamo of to-day is one of the most perfect and efficient machines the art of man has yet produced. It will return as much as 95 per cent of the power applied to it, which shows that no considerable improvement in its efficiency is possible. This is true also of motors and of so-called transformers, so one must not think of dynamos and motors as being in their infancy. They are full grown, and either may be designed to do any amount of work with greater accuracy than is possible with a steam engine for the same service. If it were true that more work could be got out of an electric machine than is turned into it by an engine, then perpetual motion would at once be attained. If 10-horse power of steam would produce 11-horse power of electricity, the dynamo could run itself and have one-horse power to spare.

One may depend upon it, no one will hereafter make dynamos more efficient than they can be made to-day, though doubtless machines may be made smaller and lighter, capable of doing the same amount of work. There is a doctrine in physical science known as conservation of energy, which is so fundamental, and is so well established, that every scientific man lets it dominate in his reasonings, and does not entertain for an instant any idea which implies its denial. For such reasons he believes that this part of electrical science is not in its infancy.

Again there is also prevalent an idea that the knowledge of electrical phenomena, and their laws possessed by electricians to-day, is so far from completeness that one may look any day for an announcement of some newly discovered laws that will practically abrogate most which we now think is well established. It may seem incredible, but this is nevertheless true, that there is not a single electrical action now in such common use but has been known for a generation or more. Arc lights have been known for 80 years. Incandescent lamps for 30 years. Electric motors drove machinery 60 years ago. An electric locomotive was made 40 years ago. The telephone was used 30 years ago. The patent was held on a legal technicality, not for intrinsic novelty.

There are plenty of electrical phenomena well known which are lying fallow. The illustrious Faraday made many electrical discoveries. One of them was a mechanical origin of electrical currents which has issued in the modern dynamo. Another was the action of magnetism upon light, and this has no commercial value at all, as it has not been made to serve any economic purpose. The known mathematical relations of electrical phenomena make it very certain that in this direction nothing can come to materially modify present knowledge. This, in many ways, is as complete as the astronomical knowledge that enables one to compute the time of the next transit of Venus.

These stated limits do not in the least imply that there is little or nothing more to be expected in the future in the development of electrical industries. Indeed, it is certain that both improved methods and new uses for electricity will appear, and some of these are now very near. The man in the rigging

can often see the hull of a vessel which is below the horizon to the man on deck, and there are several electrical crafts now visible from such an elevation. To describe such minutely is not, of course, possible; but the main features are discerned without difficulty.

The Progress of Electric Traction.

The *Engineering News* has recently published an interesting table of statistics concerning the street railroads in the United States. From it we learn that at the close of 1892 there were 5939 miles of electric railroad, 4460 miles of horse railroad, and 646 miles of cable. This is an increase of 1878 in electric mileage, 52 in cable mileage, and a decrease of 842 in horse mileage. The horse cars numbered 19,315, a decrease of 2483; the electric cars numbered 13,415, an increase of 4523. In the six New England States the electric mileage surpassed the horse roads, and the same result is found in the five North Central States, the six South Atlantic States, the six Northwestern States, and the five Pacific States. The horse-car mileage is still in the lead in six Middle States, the five South Central States, and the five Southwestern States, but it is altogether probable that in another year electric cars will lead in these States also. The total number of street cars in use is 38,400. In addition to the horse, cable and electric cars, steam dummies are used on some roads, and there are a few other systems, such as ammonia, naphtha, compressed air, etc., which severally are so small as to be insignificant.

The principal fact to be noted is the enormous increase in electric mileage and cars, and the proportionate decrease in horse cars and mileage. The electric cars already number over one-third of the total, and the horse cars have fallen to about one-half of the total. The total mileage of all street railways, including steam dummies and other systems, is 11,665, and the electric mileage is already more than half, the horse mileage less than one-half, and the cable, steam, etc., a little more than one-tenth. Four years ago there were no electric railroads to speak of. To-day, owing to the senseless, prejudiced or ignorant opposition of the daily papers, New York City is about the only large city in the United States where this form of street car propulsion is not making rapid strides to the leading place.

The reason why the electric cars do not increase in the same proportion as the mileage may be found in the fact that the cars are larger and carry more passengers, and also in the fact that the electric roads are in many cases interurban, affording a means of intercommunication among villages and country towns, which horse cars were unable to supply. The greater speed, too, of the electric cars, makes fewer of them necessary to accommodate the traffic.

At this rate of progress it will be only a few years when the last horse car will have disappeared.

Commercial Phosphorescent Lights.

We are pleased to see that the long-prophesized and much-talked-of "cold light" which is to revolutionize modern lighting appears now to have been promoted from the rank of a laboratory apparatus to that of a lamp for commercial lighting. An enterprising firm in England is making a good beginning by introducing commercial lamps in which the light is produced by high-tension discharges in phosphorescent vacuum tubes. Although, as with most inventions of a radically new type, there are still very serious objections to it, yet these are being overcome, one by one, and it is not unlikely that this beginning will encourage others to take up the field. The subject is of special interest just now, owing to the unsatisfactory state of the incandescent lamp question. As there are no fundamental patents to hinder the developing of such lamps, inventors need not fear being handicapped by some future legal decision. Attention might here be called to the recent paper of Dr. Sumner on diffusion of light, from which it will be seen that an effective illumination does not depend alone on the brightness of the lamps, but that if the light is diffused a much smaller candle-power will produce practically the same illumination. Phosphorescent light, in its very nature, is a diffused light, and the actual candle-power of such lamps is therefore not the only feature to be considered. To properly compare the cost of the diffused light from such lamps with that from incandescent lamps, an experiment should be made by lighting the same room first with one kind and then with the other, noting the different effects, entirely independently of the candle-power

of either of the lamps; from such an eminently practical test the relative costs could then be deduced. Even the most practical man could not object to such a test.—*Electrical World*.

A NEW PLAN FOR RAILROADS.—The plan of J. J. Heilman, to be tested on the State railways of France, gives promise of important and instructive results. It seeks to combine the advantages of electric and steam motors for railway lines, while rejecting the most undesirable features of both, and offers a system that can be adopted anywhere without change of track or rolling stock. The electric current is to drive the wheels, but it is not to be conveyed from stationary machines along the line; it is to be generated on the train, the locomotive being simply a traveling electric plant. A steam engine at the rear of the locomotive is to work the generating dynamo, which will furnish current to a small motor placed on each axle of the locomotive, and, also, when it is desirable to extend the system further, to a motor on each axle of the cars. The absurdity of converting the steam into electricity before using the power, is declared to be only apparent. The double loss in thus using the energy of the fuel is more than offset by the gain in applying rotary power direct to the axles, avoiding slipping of the rails, and making unnecessary the connecting rods, cranks and wheels, whose jar and friction absorb a great part of the motive force. The new locomotive, it is claimed, gives exact regulation of power and an increase of speed to 56 to 62 miles an hour without change of road-bed.

A NATURAL BAROMETER.—One of the most remarkable geological substances found in any part of the world is a stone believed to be peculiar to Finland, where it occurs in many localities, its peculiar property being a natural barometer, curiously foretelling, by the change of color, the probable character of the weather in the near future. It is known by the name of semakuir, and is said to turn black shortly before an approaching rain, while in fine weather it is mottled with spots of white. For a long time this interesting phenomenon was a mystery, but an analysis of the stone shows it to be a fossil mixed with clay and containing a portion of rock salt and nitre. This fact being known the explanation of the changes was easy; that is, the salt absorbing the moisture, turned black when the conditions were favorable for rain, while the dryness of the atmosphere would as naturally bring out the salt from the interior of the stone in white spots on the surface.—*Stone*.

Useful Information.

THE recently discovered platinum deposits in New South Wales have been visited by a geological surveyor, who has reported thereupon to the Minister of Mines as follows: "The platinum deposits in the Broken Hill district differ from any previously discovered. Owing to this circumstance and certain general peculiarities in the mode of occurrence of platinum and its allied metals, they possess a considerable amount of scientific interest. All commercial platinum has hitherto been obtained from alluvial deposits, where it occurs in the form of small but well defined grains scattered through gravels, etc., over wide areas. In no respects do the Broken Hill deposits resemble these alluvial ones. Authentic instances of platinum occurring in lodes are rare. J. A. Phillips mentions 'that small grains of platinum are said to have been occasionally observed in the auriferous quartz of the Beresovsk mines.'

ASPHALT FLOORING.—An asphaltic-concrete material for floors is described in *Indian Engineering* under the name of "bastard asphalt flooring." It consists of a six-inch layer of one-inch broken stone boiled in tar, with an upper one-half-inch layer of coarse gravel or small stone chips and slaked lime (two parts of the former to one part of the latter), boiled in a mixture of coal tar and pitch, both layers to be rolled, and the upper one finished with a top dressing of sand one-fourth inch thick and again rolled. This description of flooring has been used for freight shed platforms, etc., and found to be durable and satisfactory when not exposed to the sun. For the floors of ordinary buildings, a thickness of three inches is sufficient. The tar must be well boiled.

THE CUNNING SPIDER.—Everyone has no doubt noticed that when a spider's web is touched the insect will violently shake the web up and down, but few are probably aware of the reason for this curi-

ous action. The spider is well provided with eyes, but its sight is very limited; so much so, in fact that if a fly is caught in the web and lies perfectly still, the spider will often be unable to find it for a considerable time. When in doubt as to what quarter of the web the prey has lodged on, the spider always shakes the web and determines by the resistance the whereabouts of its game. It does so, too, with almost infallible accuracy, as any one who has the curiosity to make the experiment can determine, for in the majority of cases, after the spider has given its web a good shaking, it will start off in a run directly to the point where the intruder is lodged.

MIND THE LITTLE THINGS.—A young artist once called upon Mr. Audubon, the great student of birds, to show him some drawings and paintings. Mr. Audubon was much interested and, after examining the work of the artist, said: "I like it very much, but it is a little deficient in details. You have painted the legs of this bird nicely, except in one respect. The scales are exact in shape and color, but you have not arranged them correctly as to numbers." "I never thought of that," said the young artist. "Quite likely," said Audubon. "Now, upon this upper ridge of the partridge's leg, there are just so many scales. You have too many. Nature does her work perfectly. Examine the legs of a thousand partridges, and you will see that the scales are the same in number. All partridges are made alike." The lesson shows how Audubon became great—by patient study in small things.

STRANGE DIVERSIONS.—The Roman Emperor who used to divert himself by impaling flies on his stylus, or pen, has a modern imitator in an Australian judge. This eccentric jurist derives great pleasure from catching flies in the palm of his hand while hearing arguments on the bench. It is always instructive to consider the tastes and amusements of the truly great. One of Harvard's most celebrated professors, the author of works on botany with which every schoolboy is familiar, used to find keen delight in catching mice with his fingers. Another Harvard professor, whose erudition has made him famous in Europe as well as in America, says that the most delicious of all odors that please the nostrils of man is the incense that arises from a cook's frying-pan.—*New York World*.

FOOD FOR YOUR PLANTS.—Give your plants all the sunshine possible, most of them revel in it, writes Eben E. Rexford in the "Ladies Home Journal." It is food for them and quite as necessary as a rich soil. Ferns, some of the begonias, and a few other plants, prefer to remain in the shade, but they like a good light, such as comes from diffused sunshine. Put your fuchsias where they will get the sunshine of the forenoon, and give your heliotropes and geraniums a southern exposure. Plants like the Bermuda lily, azaleas and oleanders should be kept out of strong sunlight if you care to have the flowers last well. Be sure to give them fresh air daily.

Mechanical Progress.

A Garbage Crematory Test.

The garbage crematory erected in the city off-yard at the foot of East Brookline street, on Albany street, by the Brown Developing Company, was tested to-day in the presence of members of the city government, and the results were apparently quite satisfactory. The crematory is about 23 feet long, 10 feet wide and 10 feet high, and has fire-brick walls a foot thick, covered with boiler steel, braced with great iron rods to keep them from being forced apart by the heat. The receptacle for the garbage has a capacity of several tons, and is fed through openings in the top with iron covers. The furnace in which the fire is started is a part of the structure, and is fed with crude petroleum conducted by means of pipes from a large tank a considerable distance away. A wood fire is first started and then the oil is turned on, and, with other devices for generating inflammable gases, an intense heat is soon produced. A blower, run by a six-power steam engine, forces this fiery mass into the receptacle for the garbage, which is slowly fed in until it becomes a burning mass. After that the combustion is very rapid, the garbage disappearing almost as rapidly as it can be shoveled in. There are two chambers for its reception, and there is a system of draughts by which all the smoke and gases go from one to the other, making a complete circuit of the crematory, and then what is left escaping to the air through a high chimney.

In the test to-day all kinds of stuff were fed into the furnace just as they came from the places where they were collected, tin cans, bottles, bones and similar matter being disposed of. From 25 to 30 gallons of oil, costing about three cents a gallon, were used each hour, consuming from four to five tons of offal an hour. Scarcely any ashes are made. The amount of garbage collected by the city each day is 200 tons, and it is estimated that this can all be consumed by four furnaces at a cost of about 25 cents a ton. The whole operation is remarkably free from odor, and scarcely an offensive smell is noticeable as coming from the furnace.—Boston Transcript.

Bottle-Blowing by Machinery.

At the present time the eyes of the bottle-making world are turned to New Jersey. Their glance centers upon Woodbury, for in that quiet village the destiny of the bottle-blower may be said to be on trial. The Ashley bottle-making machine has been set in operation to see if it cannot do the work of human hands and lungs, and do it better and more economically. The machine was described before the British Association in 1889, when it was stated that bottles had been made by the machine, quite complete, which had successfully been subjected to an internal pressure of 300 pounds to the square inch. The career of the machine in England, we believe, has been most fortunate, but this does not at all diminish the interest which its introduction into America has excited. The advantages to be gained by the use of such a machine are much too solid to permit small obstacles to hinder its success. The trial run at Woodbury has been very successful. The automatic principle has not been developed to the full extent in these machines, but it has been carried so far that one man and three boys—none of them necessarily skilled glass-blowers—can operate two machines, each of which is capable of turning out two bottles a minute. The machine does not gather the glass. One of the boys, the "gatherer," is specially detailed for that service. He feeds the molten "metal" to the machine, in which it is mechanically molded, the neck and mouth formed, the interior blown by means of compressed air, and the finished bottle automatically delivered to a carrier, which takes it to the annealing oven. There is undoubtedly room for improvement both in the performance and the capacity of the machines. But the important step has been taken, and bottles have really been made in this country by machinery.—Popular Science Monthly.

Weldless Tubes.

A new method of making weldless, cold-drawn steel tubes, suitable for bicycle-making and other machine work where strength, lightness and accuracy are required, is described by an English technical journal. The steel from which the new tubes are made is of special quality, and is received from the steel works in the form of sheets. Circular flat discs are then cut out of the sheets. These discs are pressed into the

form of shallow cups, which are then pressed successively through dies of decreasing diameter and increasing the length of the cups until the flat discs of steel have assumed the form of tubes of the required length, with one end closed. The closed end is cut off after the final drawing operation has been performed. The process, it is explained, is not unlike that used for cartridge-drawing. The tubes are produced of any size from 1 3/4 inches diameter to 1.16 inch diameter, are absolutely parallel inside and outside, perfectly concentric and of any gauge down to No. 30.

High Steam Pressure.

It is well settled, says the *Scientific Machinist*, that engines can be worked with a less consumption of steam if run at a high boiler pressure, on either the compound or other multiple-expansion systems, than at low pressure, and the present tendency in steam engineering circles is toward an increase of pressure rather than a decrease. What the exact ratio of gain is as the pressure is increased has not been absolutely determined by any experiments of which we have record, says the *Engineering Record*, but there are sufficient data which may be obtained here and there to make the fact of the increased saving certain. For example, there are experiments on record showing that a compound engine of the Corliss type, working under 80 pounds pressure, will use from 16 to 17 pounds of steam per horse power per hour. There are other cases where a similar engine at 110 pounds pressure uses from 13 to 15 pounds of steam per horse power per hour. Other data are available which show that at 150 pounds pressure the consumption of steam is reduced by triple-expansion engines to 13 pounds, or, perhaps, as low as 12 1/2 pounds. Making allowances for differences in the type and condition of different engines from which data have been obtained, there is ground for the belief that with an increase of pressure from, say, 100 pounds to 150 pounds in the compound engine, with suitable change of proportion to realize the full advantage due to expansion of the steam, there is at least 10 per cent, and, perhaps, 15 per cent saving in the engine carrying the higher pressure. Without going into refinements, there is further reason to believe that between a compound engine running at 100 pounds, and a triple-expansion engine running at 150 pounds, both suitably proportioned and loaded, there is a similar gain of at least 10 per cent, and, perhaps, 15 per cent, due to the engine working under the higher pressure and greater expansion. These figures are given to show the general feeling among those who are well informed, rather than to define exactly the relative economies; and it may further be added that they are intended to indicate the relation which exists in engines which are in good order and well maintained, and the relative economy only in the consumption of steam.

To secure the benefits of high pressure it is necessary to provide extra strength in the boilers, in the steam piping and in the engine itself, or at least in the high-pressure cylinder, to withstand the increased strains. It is necessary to employ more stable joints, besides a better class of packing, and the whole equipment must be adapted, in its various details, to resist the stronger forces which are brought to bear upon it. When the plant has been well designed for these special duties it must, when set to work, be watched with increased care, and by a more skillful class of attendants, to keep it properly maintained, than one designed for low pressures. The breaking out of packings, and the increased wear of steam valves and pistons in the engine, introduce waste where high pressures are carried, which may be entirely absent where the pressures are limited to those which have been common in the past. Extra wear and tear and depreciation and the losses of steam and fuel which they cause, are the accompaniment of excessive pressures even when the construction is of the best class, and these, so far as they act, offset the intrinsic advantage which might otherwise be obtained. The interest and depreciation charges on the more complicated and expensive plant, the waste of steam referred to, the extra cost of attendance, and the increased cost of repairs and supplies, use up at best a large part of the saving of fuel, which can be made by the more economical engine, and these may become, with careless management, even larger in quantity than the entire amount of saving so that the use of high pressure produces a net loss rather than a gain.

Unless those who are intending to profit by employing excessive steam pressures and a properly proportioned engine, either of the compound or triple expansion class are prepared to combat the difficulties in handling

increased forces here briefly referred to, and make proper allowance for the waste of fuel and current expenditures incident thereto, it is almost folly to expect in the end satisfactory results.

Scientific Progress.

The Acids of Fruits.

Mr. George W. Johnson, in his *Chemistry of the World*, says in describing the "vegetable food of the world:"

"The grateful acid of the rhubarb leaf arises from the malic acid and binoxalate of potash which it contains; the acidity of the lemon, orange and other species of the genus *Citrus* is caused by the abundance of citric acid which their juice contains; that of the cherry, plum, apple and pear from the malic acid in their pulp; that of gooseberries and currants, black, red and white, from a mixture of malic and citric acids; that of the grape from a mixture of malic and tartaric acids; that of the mango from citric acid and a very fugitive essential oil; that of the tamarind from a mixture of citric, malic and tartaric acids; the flavor of asparagus from aspartic acid, found also in the root of the marshmallow; and that of the cucumber from a peculiar poisonous ingredient called fungin, which is found in all fungi, and is the cause of the cucumber being offensive to some stomachs. It will be observed that rhubarb is the only fruit which contains binoxalate of potash in conjunction with an acid."

"It is this ingredient which renders this fruit so wholesome at the early commencement of the summer, and this is one of the wise provisions of nature for supplying a blood purifier at a time when it is likely to be most needed. Beet root owes its nutritious quality to about nine per cent of sugar which it contains, and its flavor to a peculiar substance containing nitrogen mixed with pectic acid. The carrot owes its fattening powers also to sugar, and its flavor to a peculiar fatty oil; the horse radish derives its flavor and blistering power from a volatile acrid oil. The Jerusalem artichoke contains 14 1/2 per cent of sugar and three per cent of inulin (a variety of starch), besides gum and a peculiar substance to which its flavor is owing; and lastly garlic and the rest of the onion family derive their peculiar odor from a yellowish, volatile acrid oil, but they are nutritious from containing nearly half their weight of gummy and glutinous substances not yet clearly defined."

Solidified Air.

We learn from an English exchange, says *Iron Age*, that Prof. Dewar, who recently demonstrated his experiments in the liquefaction of air before the Royal Society of London, has communicated to that body, at a late session, a most interesting development of his experiments upon air at very low temperatures. He is stated to have now succeeded in freezing air into a clear transparent solid. The precise nature of this solid is at present doubtful, and can be settled only by further research. It may be a jelly of solid nitrogen containing liquid oxygen, much as calves'-foot jelly contains water diffused in solid gelatine. Or it may be a true ice of liquid air, in which both oxygen and nitrogen exist in the solid form. The doubt arises from the fact that Prof. Dewar has not been able by his utmost efforts to solidify pure oxygen, which, unlike other gases, resists the cold produced by its own evaporation under the air pump. Nitrogen, on the other hand, can be frozen with comparative ease. It has already been proved that, in the evaporation of liquid air, nitrogen boils off first. Consequently, the liquid is continually becoming richer in that constituent which has hitherto resisted solidification. It thus becomes a question whether the cold produced is sufficiently great to solidify oxygen, or whether its mixture with nitrogen raises its freezing point, or whether it is not really frozen at all, but merely entangled among the particles of solid nitrogen, like the rosewater in cold cream. The result, whatever may be its precise nature, has been attained by the use of the most powerful appliances at command—a double set of vacuum screens combined with two powerful air pumps. Upon either view of its constitution, the new solid is in the highest degree interesting and hopeful.

ARTIFICIAL GEMS.—Diamonds, sapphires, rubies and emeralds are admired for both their scarcity and their intrinsic qualities; chiefly the latter. There are numbers of things scarcer than diamonds, for instance, the metals thallium and rubidium. Rubies

and emeralds are but crystals, as are snow-flakes and rock candy. They are extremely hard, and can be fused only in an electric furnace. They are composed of aluminum and oxygen. This compound is found uncrystallized in great abundance, and when fused in an electric arc it becomes as hard as the ruby, and any color may be given to it. If not allowed to cool too quick, it crystallizes and may then be polished, when it is an artificial gem. Dealers in gems have for commercial reasons agreed not to call such stones gems, because they were not so-called natural products. It should be remembered however, that no one can endow matter with the physical qualities that make a gem an object of admiration; crystallization, density, hardness, color, refraction and so forth are inherent in the substance, and do not depend upon whether the material is assembled in the laboratory of Faust or Vulcan. Faust with a dynamo can turn out a product as good as Vulcan with his forge, and, if he be encouraged, will soon bring to the poorest in the land the most beautiful things; and will make the distinction between the rich and the poor to be only one of quantity, not the quality of one's possessions.

Progress in American Archaeology.

The science of American archaeology and ethnology owes a large and increasing debt to Professor F. W. Putnam, who represents those branches in the faculty of Harvard University, and who is also Curator of the Peabody Museum, and Chief of the Department of Ethnology and Archaeology of the World's Columbian Exposition. All these posts he fills admirably, as any one will see who will read his Report of the Peabody Museum for 1892, just issued. One fact will be sufficient: that within the last two years he has engaged, trained and sent into the field—and the field means the whole American continent, from Greenland to Tierra del Fuego—about 100 assistants and students, actively interested in collecting archaeological and ethnological material. He says with pardonable pride and entire justice: "Never before has such an extensive field of anthropological research been covered in two years' time." A brief reference to the results obtained is included in the report. Naturally, the exploration of the wonderful ruins of Copan, Honduras, is most prominently alluded to. In connection therewith Professor Putnam cannot refrain from a mild indulgence in his favorite *manie*, hinting at the discovery of "several facts pointing to Asiatic arts and customs as the origin of those of the early peoples of Central America." (Shade of Brasseur de Bourbourg!)

With like enthusiasm, though on a less scale, the Department of Archaeology of the University of Pennsylvania sent several explorers to the field in 1892, and has added largely to its collections by their efforts; while the National Museum, the Bureau of Ethnology, and the Smithsonian Institution, will show in time by their reports that the year was also singularly fruitful for them.—Science.

THE RELATIVE IMPORTANCE OF CONTAGION AND HEREDITY IN THE ETIOLOGY OF PHTHISIS.—Riffel has collated the statistics of births and deaths of all the families of a small district in Germany with special reference to this point, and from them comes to the following conclusions: There are very few families which, in the course of time, are not attacked by consumption, and when it once enters it is usually progressive, and by marriage propagates itself in other families, sometimes, however, sparing whole generations. The death rate among children in consumptive families is very great, especially where both parents have an hereditary taint; if one only is affected, it is immaterial whether it be the father or mother. The transmission of the disease from one person to another, or from husband to wife, or vice versa, or through dwelling-houses, could not be proved to have taken place. The children of phthisical parents often developed consumption, even if they had left their parents' house while still perfectly well and had gone to other dwellings or even other localities.—Boston Medical and Surgical Journal.

ACCUMULATORS.—A German firm is starting the business of supplying charged accumulators to buildings, and replacing them by others when discharged. It appears to be limited to the lighting of a few lamps only. For a battery for running two lamps of 16-candle power six hours a day, the charge is \$6.40 per month, and for four lamps \$8.50 a month. Each consumer receives two charged batteries, of which only one is used, the second answering as reserve while the first is being charged.

Patent Agency.

ESTABLISHED 1863.

Investors on the Pacific Coast will find it greatly to their advantage to consult this old
experienced, first-class Agency. We have able and trustworthy Associates and Agents in Wash-
ington and the capital cities of the principal nations of the world. In connection with our edi-
torial, scientific and Patent Law Library, and record of original cases in our office, we have
other advantages far beyond those which can be offered some inventors by other agencies. The
information accumulated through long and careful practice before the Office, and the frequent
examination of Patents already granted, for the purpose of determining the patentability of
inventions brought before us, enables us offer to give advice which will save inventors the
expense of applying for Patents upon inventions which are not new. Circulars of advice sent
free on receipt of postage. Address DEWEY & CO., Patent Agents, 220 Market St., S. F.

Founded by Mathew Carey, 1785.

BUILDERS OF

"Sensible" Horse-Power Hoisting Whims.

(DAVIS PATENT.)

PRICES REDUCED.

The "Sensible" Hoist is the cheapest and beyond doubt the best in the market. It is built entirely of iron and steel, mounted on a heavy iron base plate, and is therefore very durable and not affected by exposure to climatic influence.

The hoist gear on the drum shaft is loose, and, in hoisting, drives the drum through a friction clutch. This avoids the frequent accidents occurring with other Whims, occasioned by the breaking of the gear teeth when throwing them out of gear. In lowering, the drum is pressed by a powerful screw lever against brake woods at the opposite end. Perfect means of adjustment are provided for the friction clutch and brake blocks.

As the drum is entirely independent from the driving gears the operations of hoisting, dumping bucket and lowering can be performed with the horse in constant motion, a feature not possessed by any other horse hoist in the market, and one that greatly increases the capacity of the machine by avoiding the loss of time due to stopping and starting the horse.

It is very light and compact and very easily taken to pieces for transportation by mules. The cost of erection is very small, two men in half a day being able to put it in place ready for work.

Weight of hoist, 1200 lbs. Total shipping weight, including sweep, levers and sheaves, 1400 lbs.

Circulars giving Capacities and Prices furnished on application.

**THE BLASDEL CONCENTRATING BELT COMPANY.**

We are now having our new Improved Concentrating Belt manufactured in San Francisco. We keep always on hand Belts suitable for the Triumph and Frue machines, but can make any length or width desired. The advantages of these belts over any others will be readily seen by practical millmen.

First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight rifled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels toward the center. These slight rifles also save very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth. We can safely say that it is a better concentrator belt than has ever been manufactured. It will last much longer and will handle more pulp. We also manufacture smooth belts with same flanges when desired.

H. G. BLASDEL, Jr., Manager, 419 California St., San Francisco.

Gow, Technical Mgr.; and Asst. Treas.; T. L. Wiswall, Gen'l Mgr. and Sec'y; FRANK McCURT, Treas.; W. L. Cooper, Eng.

TRADE MARK.
The Glasgow Works, Limited, Glasgow, Scotland, also in Australia, South Africa, New Zealand, Queensland, Etc.

General Office of Company:
Rooms 8, 9 & 10, Tabor Grand Opera House Block, DENVER, COLORADO.
Also mills in operation as follows, viz: The Denver Mill, Denver, Colo.; The Livestock Gold Mining Co., Boulder Co., Colo.; The Puzzle Gold Mining and Milling Co., Boulder Co., Colo.; The Cripple Creek Gold Extraction and Power Co., Colo.; Calumet Gold Mining Co., Middle Creek, Eschscholtz Co., Cal.; The Shasta Gold Ex. Co., Middle Creek, Shasta Co., Cal.; The Mercer Gold Mining Co., Fairfield, Utah; Chumley's Mine, Humboldt District, Yavapai County, Ariz.; The Crowned King and Last Chance Mine, Yavapai Co., Ariz.; The Union Mines, Maricopa Co., Ariz.; The Revenue Con. Gold Mining Co., Reveuse via Norris, Mont.; The Oregon Mining & Milling Co., Creighton, Cherokee Co., Georgia; and others in course of erection.
The object of this company is to introduce the MacArthur-Forrest process.
We have purchased from the Cassel Gold Extraction Co., of Glasgow, Scotland, the exclusive right for the United States to use patents covering this process.
If you desire an experimental test communicate with the secretary.
If the results of the tests are favorable, we will then make arrangements to treat a quantity of not less than five tons at Denver.
We are fully prepared to grant royalties to mine and mine owners, or rights covering districts and counties.
The process consists of pulverizing the ores to a fineness of about 50 mesh, and then subjecting the same to an action of a very dilute solution of cyanide. A few tubes especially constructed according to our diagrams, for triturating, settling and filtering, is all that is required in connection with any kind of pulverizing stamps or rolls.
The total cost, as a rule, does not exceed from \$2.50 to \$5.00 per ton.
The most desirable class of ores for this process are so-called refractory gold ores, pyrites, hematite manganese and tellurium. We have also treated successfully dry silver ores.
We will be pleased to answer any inquiries and furnish any desired information. Address,
T. L. WISWALL,
P. O. Box 926. Gen. Mgr. and Secretary.

Practical Hydraulics.

A Book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers, and Irrigators.

By P. M. RANDALL.
This new work is by one of the most experienced hydraulicians of the country. It abounds with useful tables for ready reference, in which the results of abstruse calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulae, coefficients, etc., are given; and for those not familiar with higher mathematics, examples, rules, and tables are prepared. Thus the needs of the scientist and the practical miner or millman are each met. It is the most complete work on the subject yet published, and is specially applicable to the Pacific Coast.
Table of Contents.
The following brief abstract of the contents will give an idea of the branches of the subject treated:
General Plan; Discussion of the Principles of Hydraulics; Rules Deduced from Formulae Obtained; Examples and Calculations; Extensive Tables for Ready Reference; Fundamental Laws of Hydraulics Demonstrated and Expressed in Formulae and Rules; Flow of Water through Openings; Weir Coefficients; Triangular Weirs; Flow of Water Over Quadrant Weir (submerged); Application of Tables; Submerged Orifices; Flow through Orifices in Thin Partitions; Tables and Applications; Miners' inches; Tables and Calculations; Flow of Water through Short Tubes and Compound Tubes; Flow of Water through Pipes; Tables of Velocities and Cubic Feet Flows for Given Fall per Mile and Diameter of Pipe; Coefficient for Bend—Circular and Angular; Flow through Nozzles; Inverted Siphons; Flow of Water in Open Channels; Extensive Tables; Rough and Ready Notes; Hints for Speedy and Approximate Estimates, etc.
Price, \$2.00, post-paid. Sold by DEWEY PUBLISHING CO., Publishers, 220 Market St., San Francisco, Cal.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

To Develop.—Amador Ledger, April 7: Tony Reale returned last week from San Francisco, accompanied by his friend George Dahl. They are now up inspecting Mr. Reale's mine at Forty-Nine Flat. Mr. Reale says he hopes to make arrangements whereby he can thoroughly develop this property in the near future.

Copper.—Colonel Robinson, owner of the New-tou copper mine, near Ione, has secured a working bond on 4 500 feet of the quartz lodes within the Garavanta ranch at Middle Bar, and will commence work immediately. The Colonel will return in a day or two from San Francisco with his family and will build a dwelling house near the scene of the proposed operations.

Bay State.—Superintendent W. T. Jones of the Bay State, near Placerville, reports that operations at the mine are progressing as rapidly as the nature of the work will permit. The water in the shaft is now down 200 feet, and is being lowered at the rate of sixteen feet per day. If nothing unexpected happens, it will take about seven days to reach the tunnel. Assessment No. 13 has all been paid, there being no delinquencies.

Butte.

The Spring Valley Suit.—A case was submitted to Judge Brewster of Placer county on Friday last involving points of the highest importance in mining circles. The Spring Valley Hydraulic Mining Company, incorporated under the laws of New York State, owned extensive mining property in Butte county, this State. In 1881 it executed a mortgage to three trustees, William Alvord and F. F. Low of San Francisco, and W. B. Laidlow of New York, to secure the payment of 200 bonds of \$1000 each. In 1886 there were 155 of these bonds outstanding, and there was also an indebtedness to the Bank of California. As the stock was unassessable under the laws of New York, the property was conveyed to a California corporation named the Spring Valley Gold Mining Company, but this corporation failed, and the Bank of California, Rideout, Smith & Co. of Marysville, and Charles Waldeyer obtained judgments to a large amount. The trustees brought a foreclosure suit in the Superior Court of Butte county and made both the old and the new corporation defendants. There are no less than ten points on which the plaintiffs and trustees are unable to agree, and all the propositions are now being submitted. The bondholders and trustees are represented by Henry E. Highton and T. Z. Blakeman, the Spring Valley Gold Mining Company by C. W. Cross, and the Bank of California by J. M. Allen.

Calaveras.

West Point.—Calaveras Chronicle, April 8: West Point has looked quite blue for quite a long while, but I am now happy to state things are beginning to brighten. The Lone Star Mine is progressing finely. James G. Role, Esq., the superintendent, is expected back from Wisconsin soon, where he has been in council with the company, relative to the sinking of a shaft upon the property. The shaft thus proposed, as near as can be ascertained, is to be sunk from the top of the hill—it will be remembered the mine is in the bottom of the North Fork Canyon—below the river bed. The extensive operation of sinking from the hilltop is for the purpose of taking out the ore between the tunnels and the surface of the hill. The mine is now working a crew of about thirty-seven men. The Blazing Star Mine has started up with a crew of about eighteen men, with Mr. C. J. Moore as superintendent and Richard McGee, foreman. There is some talk that Mr. Foster, the owner of the property, is going to put up works and work the ore by the new electric process. The Oatis, Mithenbaur & Co's mine, situated about two and one-half northwest from this place, is about to resume operations with Prof. H. C. Oates as superintendent. It will be remembered that last fall this mine proved to be a valuable piece of property, the ore prospecting between \$80 and \$100 per ton.

To Resume Operations.—We have been informed that the Eureka Mining & Lumber Company will commence work on their mines in the West Point District in a few days. The company also intend to run their saw mill and they will have for sale all kinds of lumber at reasonable prices. The officers are as follows: Joel Rowe, superintendent; W. D. Harris, secretary; J. M. Thomas, treasurer.

Mono.

An Important Lease.—Bodie Miner, April 1: A. P. Cameron, Archie Graham and James A. Kelly have secured a year's lease of the Noonday and Red Cloud. Considerable rich ore was taken out of these mines in early days, and there is undoubtedly a great deal more to be unearthed. Heretofore the owners have pursued a dog-in-the-manger policy—doing nothing themselves and refusing to give others a chance to do anything. It is the intention to work only the Noonday at present. Messrs. Cameron, Graham and Kelly are all practical miners and their lease will very likely prove a bonanza to them.

Affairs at Benton.—Bodie Miner, April 7: Supervisor William Calnan, of Benton, was in town the early part of the week on his way to Bridgeport. He denies emphatically that there was any shooting over mining claims there a week or so ago. The owners of the Little Emily and Modoc claims have had a dispute over boundary lines, and both sides are now restrained from working, pending a settlement of the affair by the U. S. Court at San Francisco. The trial of the case will probably take place

this month. The strike said to have been made there recently must have originated in the mind of some imaginative person who has no particular regard for the truth. Of course, it is well known that some rich gold has been found near Benton in the past, but not in sufficient quantity to make a bonanza. At present little or nothing is being done around Benton, as the hills are covered with snow. As to a boom being experienced there in the spring, it is all nonsense, and such a presumption is in no way justified by the present conditions.

The Bodie Con.—Bodie Miner, April 7: During the past week east crosscut, 300-foot level, was extended 7 feet. North drift, 200-foot level, Lent shaft, was extended 11 feet. West crosscut, same level, was extended 16 feet.

The Mono.—During the past week east crosscut from main south drift, 550-foot level, was extended 15 feet. North drift from east crosscut, 400-foot level, was extended 13 feet. There were employed 4 miners, 1 carman, and jointly with Bodie, 1 engineer, 1 blacksmith, 1 watchman, 1 foreman.

Nevada.

Good News From Olin.—Transcript, April 8: The Olin Gravel Mining Company are now in gravel and it prospects well. They will commence washing very soon. They are now running two drifts, thereby increasing their force of men. The Olin, Maozanita, Yosemite, Harmony and West Harmony will have booming times before long.

Some Fine Specimens.—Grass Valley Union, April 9: Messrs R. R. and W. Dunstan yesterday showed a Union reporter some specimens of rock taken from the Dunstan claim near Rough and Ready. The rock was filled with coarse gold, specimen rock in fact. They have a twelve-inch ledge which shows well in coarse gold.

The Baltic Mine.—Grass Valley Union, April 9: The Baltic mine, situated near Rough and Ready, still continues to be looking well, and the prospects of its being a good paying mine are very good. Several bids have been received for a contract to furnish machinery and build a new mill, and in less than three months the company expect to have a five-stamp mill running. The ledge is twelve inches wide, which is very encouraging to those interested. As soon as the contract for the mill is awarded additional men will be put to work stoping and taking out rock. The cave that occurred in the tunnel last week has been repaired, and the tunnel is clear. An assessment of two cents a share was levied on the stock to help defray the present expense and to use a part as a reserve fund for future use. One more assessment will be sufficient to pay for the building of the mill and such other repairs as are necessary. We hope to see in the near future a large number of men wending their way daily to and from the mine.

North Banner.—At the annual meeting of the stockholders of the North Banner Consolidated Tunnel Company held Monday afternoon, the following gentlemen were elected directors: George Fletcher, Grass Valley; John F. Kidder, Grass Valley; E. H. Brown, Grass Valley; Joseph Weissheim, Grass Valley; Julius Jacobs, San Francisco. After the adjournment of the stockholders' meeting the board-elect assembled and organized by electing officers as follows: George Fletcher, president; John F. Kidder, vice-president; E. H. Brown, treasurer; Thos. J. Michell, secretary.

At the Copper Mine.—Transcript, April 5: From a recent visitor to Spenceville it is learned that everything is booming in that burg. Mr. Rohrbacher of San Francisco, treasurer of the Imperial Paint and Copper Co., is now in Spenceville, and, in addition to the men already employed, a number will soon be put at work. The old furnaces connected with the paint works are to be torn down and new furnaces of the most advanced modern type to be completed at once. The Spenceville paint, a California product, will soon be in demand all over the United States. From the mine, copper is constantly being produced and shipped in the form of cement to the market, where it is in strong demand. This thriving little town is one of the most prosperous of our communities. The works are under the able superintendency of Mr. Otto Woehler, well known throughout the county. The following are the officers of the company: Pres., R. Herman; Sec., Louis F. Dunand; Treas., P. Rohrbacher; Supt., Otto Woehler.

Plumas.

From Greenville.—Plumas National Bulletin, April 8: D. McIntyre, the Greenville merchant, was in Quincy Saturday on business. He reports Greenville prospering to its usual extent. As soon as the snow leaves at Wolf Creek he will start his mill there to crushing ore from the Blind Lead mine. John Taylor has been in charge of the work there during the past winter and has been running a new tunnel, which will permit the ore to be dumped directly into the mill. Firmstone & Richards are extracting ore from the Phoenix mine in North canyon and will crush it in the Johnny Bull mill. The vein is small but the ore is of good quality. At the Indian Valley mine, W. S. Drury recently finished retimbering the main tunnel, otherwise no work has been done on that property lately. Mr. Prentiss, the chief owner and superintendent of the mine, is in the East. In that section the snow is rather low down on the mountain.

Siskiyou.

Cinnabar.—Yreka Journal, April 5: The rich strike of cinnabar on Klamath river, below Oak Bar, and opposite the mouth of Horse creek, promises to be the richest quicksilver mining district in the State. The discovery is but a few feet from the wagon road leading down the river from this part of the county, thus requiring no great difficulty in reaching railroad communication via Humbag Creek, Hawkinsville and Yreka. The specimens shown are excellent and contain as large

percentage of quicksilver as the best lodes yet discovered anywhere in the State. The south wind and warm rain last Wednesday night melted the snow very rapidly and the ditches and little streams are now well supplied with water for operating the hydraulic mining giants and running quartz-mills, as well as furnishing an abundance for all other kinds of mining.

Gravel.—Anstin & Co., of the Greenhorn blue gravel mine, having pumped out last week, are now hoisting pay gravel with good success, the gravel yielding good returns. The paying strata on bedrock varies from one to six feet thick, and is extensive enough for at least ten years' steady work, with prospects of further strikes of blue gravel in various portions of Yreka basin. In fact blue gravel, like that on Greenhorn, is found anywhere in this vicinity, and the yellow gravel like that found in the Yreka townsite also pays well—not less than 25 cents to \$1 to the pan at bedrock, but cannot be worked only by owners of town lots an every lot-owner has a patented deed from Government.

Placers.—Some rich placer mining claims have lately been discovered on Elliott creek, near the summit of Siskiyou mountain, in the Beaver Creek region, but there is too much snow in the vicinity at present to do much work in developing them, although the creek is clear of snow where the diggings are located. The weather in that high altitude is cold most of the time at present, to keep the snow from melting, hence there is no water to start work, but an abundance may be expected very soon, as it is about time for the warm days of genial springtime. The Spangler Bros. are now busily engaged in getting their new 15-horse power double-action steam engine in position for work at mouth of Humbag creek, and within a couple of weeks expect to commence opening the creek bed from Klamath river up, where they have to excavate at least 30 feet by the use of derricks in lifting the crates of gravel and hoisting out boulders. Brooks & Co. of Quartz Valley, are taking out a large amount of fine quartz from their four-foot ledge which pays from \$10 to \$20 per ton. Splan & Co., of Quartz Valley, are also taking quartz from a 20-inch lode that pays \$10 a ton. David Stary, in same locality, is finding richer quartz than ever in his ledge at the Hull Gulch section of Quartz Valley. Messrs. Detwiler & Keith, cinnabar experts from El Paso, Texas, are down on the Klamath in Oak Bar district, also Mr. Bradford, of the Bradford Bros. cinnabar mine of Lake county, and Mr. Newcomb, of the famous Oak Hill cinnabar mine in Napa county, is expected there soon to start operations at the Beaver Creek cinnabar mines in the Siskiyou foothills. Barton & Lange are at work on their newly-discovered cinnabar mine below Oak Bar, on the Klamath, and think they have a big thing in the cinnabar line, but cannot unbosom a mountain in a day. Everything looks good as far as developed. Cinnabar is found in good quantities in the foothills and tributaries along the Klamath from Beaver creek for many miles down the river and up into Siskiyou mountains and all the foothills bordering the river, making a fine field for prospectors.

Trinity.

A Bro Mining Deal.—Redding Democrat, April 4: Some weeks ago a party of four arrived here from Denver, Colorado, and took a four-horse conveyance and went to Trinity county. The party was composed of a French haron and his wife, another rich Frenchman named Beandry, and L. R. Bailey, a banker at Ouray, Colorado, who chaperoned the party. Their visit to Trinity was to inspect the Hubbard gravel mine, which they purchased last year for \$25,000, and on which they had expended \$50,000 in a big ditch to carry water on to the claim. When the party arrived at this mine piping was in full blast, and after a run of 40 hours \$1500 was cleaned up from the boxes. The same party then spent some days in making a thorough investigation of the Lovernage mine. This property is situated in Oregon Gulch mining district, four miles northwest of Weaverville, and was located about 1851. It consists of 154.40 acres and water ditches taking water from West Weaver creek and Rnsh creek. The examination of this property resulted in a sale to Mr. Bailey and the Frenchmen for \$250,000. After closing the deal the party returned here Saturday evening and took the overland train for San Francisco. We are informed that it is the intention of the new owners to expend a large sum of money supplying the mine with more water and will work the ground on a very extensive scale.

A Good Cleanup.—Journal, April 9: A. G. Dunbar, manager of the Hubbard mine, came up Thursday with the cleanup after a 12-days' run. One of the prettiest reports we ever saw was the one Mr. Dunbar showed us that day. The cleanup weighed 214 ounces and is expected to mint a little over \$4000. The flumes only were cleaned up, and it is estimated that the under-currents contain from \$500 to \$1000. The company has about 300 inches of water delivered at the mine, which is reservoir and discharged through a five-inch nozzle. The actual time the pipe was playing on the bank was 125 hours. This is an extra good showing for the amount of work done. Thursday the last payment, \$13,000, was paid by the company to H. Jankins and he delivered the deeds to the company's manager, Mr. Dunbar. This company has fulfilled every agreement it has entered into, and we hope they will get many times the purchase money out of the gravel bank.

Tuolumne.

Rawhide District Mines.—Tuolumne Independent, April 8: We hear, from undoubted authority, that Mr. Richard Chute, of San Francisco, has decided to open up his mine as soon as the weather permits, and that he has an option on Mr. Jack Jackson's Isabella and

Gem Consolidated mines, which adjoin Mr. Chute's Rappahannock to the north. The reason he requires and proposes purchasing the latter property is on account of the great natural advantages Mr. Faxon's mine and location possesses, owing to his valuable water-power, which can only be obtained on his property. Either water (transmitted by cable) or electric-power will be adopted, which will be decided when Mr. Chute comes to Sonora very shortly, when he will have the necessary surveys made which will determine all matters therewith. The power mentioned is sufficient to drive all the machinery and mills in that section and the only available one. The opening up of these mines will give considerable impetus to mining generally in the county and we wish Mr. Chute success. It is assuredly a rich section as any in the State, and being on the famous mother lode of California adds considerably to their known value.

At Work.—The Golden Gate mine resumed operations on Thursday. As this mine employs from 30 to 50 men, its revival is encouraging to our business interests.

NEVADA.

Washoe District.

Con. Cal. & Va. Mine.—Virginia Chronicle, Apr. 8: 1500 level—Have continued to extract ore and old fillings in working upward in the old south stopes, from the 10th to the 15th floors above the sill floor of this level. 1600 level—Are repairing the main south drift and the east crosscut leading therefrom to the upraise connecting with the north drift on the 1500 level; also extracting a few tons of ore from the old stopes east of the main south drift. 1650 level—Have continued making necessary repairs to the drifts on the sill floor of this level. We continue to extract some ore from the old stopes, eight floors up in the unraise No. 6 carried up from the main northwest drift; also from the old stopes in working north from the crosscut run west from the northwest drift. From the drift run west from these north workings, 27 feet up, the upraise started 50 feet in from the mouth of the drift, has been carried up 14 feet in a porphyry and quartz formation. In working in the north and south sides—partly in old timbers—of the drift run east (at a point 20 feet down) from the winze which was sunk from the west crosscut from the main northwest drift, we have extracted some ore of fair quality. Have extracted the week from all parts of the mine 653 cars of ore, about 645 tons. Shipped to Morgan mill 376 200-2000 tons of ore. Average assay value, per railroad car samples, \$32.50. The mill started up on the 7th inst. and worked 90 tons, the assay value of which, per battery sample, was \$31.65 per ton. Bullion shipped to the Carson Mint, assay value, \$33,376.52.

Ophir.—500 level—Jointly with Mexican Co. continue doing necessary repair work in the west drift from the main shaft. 1565 level—The winze now going down below the sill floor of this level has been sunk during the week 14 feet; total depth, 40 feet. The bottom is in porphyry and clay showing streaks of quartz which carries a very low assay value.

Mexican.—On the 1565 level—West crosscut No. 2 from the north drift from the east crosscut from the bottom of the winze, sunk from the 1465 level down to this level near the south boundary, has been extended 21 feet; total length, 110 feet, continuing in a hard porphyry formation carrying clay separations and showing fine lines of quartz. 500 level—Have continued making necessary repairs, jointly with the Ophir Co., in the west drift from the Ophir shaft on this level.

Utah.—340 level—The south drift from the main west drift at a point 535 feet in from the shaft has been extended 8 feet; total length, 237 feet; continuing in porphyry, clay and quartz formation. Have resumed work in west crosscut No. 3 from the north drift, and extended the crosscut 5 feet; total length, 81 feet; in quartzite and clay formation.

Sierra Nevada.—The intermediate tunnel on Cedar Hill has been advanced during the week 16 feet, making the total length 266 feet; the face is porphyry. The joint Sierra Nevada and Union west drift, 900 level, has been advanced 22 feet, making the total distance west of the joint shaft 3079 feet; the face is in hard porphyry and small streaks of clay.

Union Shaft.—The joint Sierra Nevada and Union west drift, 900 level, has been advanced the past week 22 feet, making the total distance west of the joint shaft 3079 feet; the face in hard porphyry and small stringers of clay.

Andes.—North drift from east crosscut No. 1 north on 420 level advanced 14 feet; total length, 201 feet; formation, clay and quartz. We have also been timbering in this drift.

Best & Belcher.—200 level—The northwest drift has been extended 20 feet, passing through porphyry, clay and quartz; total length, 215 feet. 900 level—The southwest drift started in west crosscut No. 3, 20 feet from top of upraise No. 1, 1000 level, has been extended 13 feet; total length, 78 feet; face in hard porphyry. Sutro tunnel level—The joint east crosscut with Gould & Curry Co. has been advanced 22 feet; total length, 29 feet. Work has been temporarily discontinued in this crosscut. We are repairing and cooling the Gould & Curry old drift, leading to the winze which was carried down by them from the 1600 to the 1900 level, so that a more accurate survey can be made to locate this winze, that the same may be connected with our joint north drift. This connection will give good ventilation and enable us to resume work in this drift.

Gould & Curry.—200 level—During the past week west crosscut No. 5, started in north-west drift, 432 feet from main west drift, has been advanced 16 feet; total length, 416 feet;

face in hard porphyry. Suro tunnel level—The joint east crosscut with Best & Belcher Co. has been extended 22 feet; total length, 29 feet. Work has been temporarily discontinued in this crosscut. We are repairing and cooling the old drift leading to the wioze which was carried down from our 1600 to the 1900 level, so that a more accurate survey can be made to locate this winze, that the same may be connected with our joint north drift. This connection will give good ventilation and enable us to resume work in the joint north drift.

HALE & NORCROSS.—In the main shaft are easting the timbers between the 1000 and 1100 levels. Main Incline—We continue making the necessary repairs and are doing some retimbering between the 1300 and 1400 level. 1800 level—Advanced west crosscut on our south boundary 20 feet; total length, 73 feet; face in porphyry and quartz.

CHOLLAR.—Are retimbering and repairing the west crosscut, 450 level, and retimbering the two north compartments of the main shaft above the 930 level. The east crosscut near the south line, 930 level, is out 103 feet; face is in porphyry.

POTOSI.—East crosscut No. 3, 850 level, is out 346 feet; face is in clay, porphyry and low-grade quartz. The west crosscut from the north drift, 930, is out 42 feet; face is in porphyry and low-grade quartz. East crosscut, 75 feet north of top of raise, 1000 level, is out 23 feet; face is in porphyry and low-grade quartz. The repairs to the Potosi winzes and the Ward shaft are not yet completed. Extracted and sent to the mill the past week 445 tons and 750 pounds of ore from the 550, 930 and 1150 levels. Milled during the week 445 tons. On hand at mill, 141 tons and 500 pounds. Average battery assays, \$21.41; average car sample assays, \$22.64. Shipped to U. S. Mint at Carson, 1168 pounds of crude bullion.

OCCIDENTAL.—The main north drift on the 750 level has been extended 14 feet; total length, 712 feet; the face is in porphyry and stringers of quartz. The upraise above No. 2 winze in south drift, 750 level, is up 84 feet and is showing bunches of fair-grade ore. The Zigzag drift, Suro tunnel level, has been extended 15 feet; total length of main drift, 912 feet; formation, hard porphyry.

KENTUCK.—From the stopes above the 160 level we continue to extract from two to three tons of ore per day of the average value of \$33 per ton as per car samples. The south drift from the Jacket east crosscut on 1100 level is in 205 feet and has reached the Kentucky line. The ore in the face of the drift assays from \$5 to \$40 in gold. Shipped to the Nevada Bank treasurer, bullion valued at \$2,756.85.

EXOQUEUR.—Are yet engaged retimbering the Ward shaft.

WARD SHAFT.—Are retimbering the shaft 100 feet from the surface.

ALPHA.—Are yet engaged retimbering the Ward shaft.

BULLION.—Are yet engaged retimbering the Ward shaft.

CON. NEW YORK.—The winze below the 650 level is down on the slope 123 feet; the bottom is in quartz, some of which gives fair assays. The west crosscut from the southwest drift from the shaft, 850 level, is out 139 feet; face is in hard porphyry.

SILVER HILL.—The southeast drift on the 450 level has been advanced 5 feet during the past week through hard porphyry; total distance from north line, 88 feet.

APAX.—Have sunk winze 45 feet; ledge steadily improving.

Spring Valley District.

PLACES.—*Silver State*, April 8: J. B. Foltz says hydraulic operations were commenced at his placer mines in Spring Valley about ten days ago. He has placed a No. 2 monitor in position, and, under a full head of water, work is being vigorously prosecuted with promise of gratifying results, as the ground now being worked is very rich, yielding as high as \$3 to the pan. Mr. Foltz was compelled to suspend operations last year on account of the water giving out just as this rich piece of ground was reached. At that time he cleared up \$300 as the result of the last two days' run. This year there will be plenty of water for working the placers at least four months, and the outlook is very encouraging. Mr. Foltz has expended considerable money in Spring Valley in the past three years, and it now seems that his efforts are to be crowned with the success they deserve.

Murphy District.

A GOLD CAMP.—*Cor. Pioche Record*, April 5: Murphy district is about 40 miles southeast from Goode Springs, in Lincoln county, and is a gold camp. The principal mines are the Longstreet, Big and Little Tiger and a claim belonging to your humble servant. The Longstreet mine is a big gold-bearing ledge, carrying some very rich rock and averaging a little over \$20 to the ton. The two Tigers, owned by W. H. Sherman, are not being worked at present. I predict a brilliant future for Murphy district. The formation is granite.

Tuscarora District.

CYANIDE PROCESS.—*Tuscarora Times-Review*, April 5: The Union Mill Company has been shoveling snow from its tailing reservoir to enable it to get the same on which to start its new cyanide plant, which is completed and only awaiting material to run on to be put in successful operation. While these tailings have refused to yield their gold and silver values up by any of the old methods of reduction, it has been thoroughly proven with a trial plant that they can be successfully and profitably worked by the MacArthur-Forrest cyanide process, the rights of which have been secured, and for which purpose the works just completed have

been built, and would have been in operation before this but for the unprecedented late spring. However, if the present favorable weather continues, they will be running in a few days, and, from the profits derived, an impetus will be given to prospecting in the North Belle Isle, Nevada Queen and Commonwealth mines, to whom the mill belongs, which, together with the labor directly employed in the new works, will make better times in this vicinity during the coming summer.

Crescent District.

RICH ORE.—*Cor. Pioche Record*, April 5: Crescent district is about eight miles southeast of Murphy, and the formation is also granite. The ledges are small, but very rich. The ore carries gold, silver and lead, and comes in the shape of fine-grained galena. Mr. Gilbert of Cedar district, in the Monkey Wrench country, is the assayer of the district, and is also the owner of some valuable claims. You will hear more of Crescent and Murphy districts. The owners of the Mexican mine, in Crescent district, shipped three carloads of ore from their mine that went \$250 per ton. The district is a good one for an industrious man—the best in the State. I cannot imagine a more independent position for a man than to be the owner of a small ledge of rich ore. It enables him to keep a wad in the bank and to take a spin or a spree when he feels that way. It's the worst luck I would wish all the boys—a stringer of high-grade stuff.

Bristol District.

COPPER FURNACE.—*Pioche Record*, April 6: Charles L. Roe has about completed arrangements for another run of his copper furnace at Bristol. Coal and other supplies are being put in and the furnace is expected to blow in about the 15th inst. The copper ore on which this run will be made comes from the old Cave mine in Bristol district. It runs high in copper and well in silver, and is easily worked. The product this time will be of higher grade than any produced heretofore.

MILL MOVING.—Teams came in from Beaver during the week, and yesterday the last of the Bristol quartz mill was shipped to the gold claims nine miles above Beaver. W. T. Rich has the contract to erect the mill and will leave for that purpose to-morrow. As it is a gold proposition, pans and settlers will not be added until a trial run of the mill is made, to see if they are necessary or not.

Ely District.

LEACHING.—*Pioche Record*, April 6: The large 50-ton tanks which will replace eight small ones now in use at the Bullionville works are now on the way from San Francisco, and advices of their shipment from Milford here are daily expected. The output of the leaching plant has been increased of late, due to higher chlorinations being secured and careful work in general. All first-class sulphides are now melted into bars before shipment, while wash water, or second-class sulphides, are shipped after being dried, only. A shipment netting some \$4500 was made last Saturday, which will assist materially in getting in shape for an increased output.

Pine Grove District.

EXAMINING MINES.—*Hawthorne Bulletin*, April 7: Commissioner Wilson informs us that there is a number of Eastern mining men now at Pine Grove. They are examining several mines in that locality with a view of purchasing the same and working them on a large scale.

Osceola District.

THE RED MONSTER MINE.—*Cor. Salt Lake Journal*, April 7: The Red Monster mine is composed of a group of parallel veins, running in an easterly and westerly direction and laying within a width of 200 feet. Across this claim there is a group of north and south veins called the Cross mine, and both constitute what is generally known as the Red Monster mine. The work done was on one of the east and west veins. A shaft has been sunk 100 feet and a tunnel run 230 feet on this vein, showing a big broken ledge dipping to the south. The ore lays in chutes, and the course of the chute in the ledge is from east to west at about half pitch. The largest chute encountered is 75 feet through and seven feet wide. From the richer decomposed parts of this ore \$1300 has been washed with a rocker, much of the gold being coarse. The largest piece was 32 ounces, but this is the exception, as an average of from \$10 to \$15 per ton is looked for. There are 400 tons of ore on the dump, and the mine, with its present development, will yield 40 tons per day for a long time, and the many places that show ore on the surface indicate that when the development is extended, a very large production may be looked for. The facilities for cheap mining here are as good as can be had anywhere 100 miles from a railroad. There is water power 1½ miles below the mine, and, by bringing in a creek 2½ miles, another water power can be constructed at the foot of the hill half a mile from the mine.

Ferguson District.

THE APRIL FOOL AND MONITOR.—*Salt Lake Journal*, April 7: D. A. Reeves, one of the owners of the April Fool group, in Ferguson district, is in town. He informs us that a shipment is en route to this market, which will average about six ounces gold and three ounces silver per ton. This ore is from the Monitor, one of the group, which has developed into a much richer property than the claim from which the group takes its name. A tunnel has been driven in 200 feet on the vein, following the footwall. At the breast a crosscut has been run 18 feet, and the hanging wall has not yet been reached. Next to the footwall there are four feet of manganese and talc averaging from 40 to 60 ounces silver and \$7 to \$8 in gold per ton. Next comes six feet carrying a value of

six ounces gold and three ounces silver per ton. The value of the remainder of the vein has not yet been ascertained. Mr. Reeves says there is some excitement in Pioche over the strike in the Demijohn mine, west of that camp, as mentioned recently in these columns.

ORE FROM THE MAGNOLIA.—J. J. Maoning, assessor from Lincoln county, Nev., is in Salt Lake, en route home from Carson. He is one of the owners of the celebrated Magnolia mine in Ferguson district. The company is at present employing seven or eight men, and two or three cars of ore, carrying four or five ounces gold per ton, are now on their way to this market. Mr. Maoning informs us that the Magnolia Company thinks of starting the old Hiko mill, in Fabranagat valley, 30 miles west of the mine, and treating its product there. The mill has a capacity of 20 tons daily.

BRITISH COLUMBIA.

AFTER ORES.—*Nelson Tribune*, April 8: Chas. G. Griffith, a representative of the company operating smelters at Great Falls and East Helena, Mont., arrived in Nelson on Friday. He has made several trips to this district as a sight-seer, but he is now here on business. Heretofore the smelters which he represents drew their supply of lead ores from the Coeur d'Alenes principally, but that supply is now being greatly reduced owing to the shutting down of several of the largest of the producing mines. The ores of the Slocan will be purchased from this time on, as they are the best ores obtainable for fluxing, owing to the high percentage of lead carried, one ton being equal to a ton and a half of concentrates from the Coeur d'Alenes mines. As an instance: Supt. Fisher of the Freddie Lee recently took a careful sample of a 50-ton shipment. The sample gave a return of 127 ounces silver and 79 per cent lead. No other country produces so uniformly high-grade ore. The smelter at Great Falls and the one at Helena have four stacks each, and a daily capacity of about 250 tons. The same company has a one-stack smelter and a refinery at Chicago.

DEVELOPMENT WORK ADVANCING.—George W. Hughes, the freighter, was in Nelson on Saturday. Asked as to the ore shipments from the mines in Slocan district, he said that had development work in the mines been as far advanced on January 1st as at this time, the number of tons shipped would have corresponded very nearly to the estimates made last fall. As it is, however, the total tonnage is a little short of the estimates. The Kaslo road was in better condition this month than at any time during the winter, and his teams easily, even now, bring full loads to the wharf at Kaslo. Mr. Hughes has great faith in the future of the district, and is directly interested in mines as well as freight outfits.

OUT OF SUPPLIES.—Work has been suspended on all the mines in Trail Creek district except the O. K. gold claim on Sheep creek. The reason given therefore by E. S. Toppiog, who came up to Nelson on Tuesday, is a lack of supplies. Work will be resumed as soon as the trails are free from snow, which will be in about a month.

IDAHO.

RICH STRIKES.—*Silver City Avalanche*, Apr. 8: We were shown some fine specimens taken from the Ruth mine (one of the Ralph Pool) yesterday, which are almost pure gold and are variously estimated at \$50 to \$100 per pound. They were taken from the adit tunnel, which is over 800 feet in length, and at a point 400 feet below any former workings. The ledge is from three to five feet in width of good millling ore, with a rich streak of almost pure metal from two to four inches in width. A fine body of very high-grade gold rock has been opened in the Oso mine of the Poorman group, at a point 100 feet lower than the former workings. The ore is identical with that found above. The South Central, owned by Gilbert Mikkleson, is taking out some very rich gold ore. Next week we will visit these properties and give our readers an idea of what may be expected, from War Eagle mountain this summer. It has produced millions of dollars, and bids fair to duplicate its record.

MINING MENTION.—The ledge in the face of the Blaine tunnel is now seven feet between walls. In the Blaine stope the ledge is two feet wide, with from four to six inches of \$100 ore. The ledge in the Trade Dollar stope is two feet wide, with from 8 to 12 inches of \$140 ore. A survey will be made within a few days to ascertain the exact position of the tunnel. Another very rich shoot of ore has been encountered in the Black Jack mine. This makes three remarkably rich bodies of ore opened in this property. They are literally buried in ore, and no great amount of work can be done until the mill starts up. Wood is now being hauled. There are some ten men employed in the Phillips & Sullivan mine, and some fine rock is being extracted. We are informed that a good "crushing" is now in the ore house awaiting the opening of the roads.

OREANA OPAL FIELDS.—*Elmore Bulletin*, April 8: Mrs. Linnehan, who has recently returned from her ranch near Oreana, brought here a large collection of beautiful opal specimens found about three miles from Oreana and immediately adjoining the ranch enclosure. Not long since a little boy discovered some very pretty stones in that section and took them home, and upon examination they proved to be opals. Since then these precious stones have been found on Black, Hart and Picket creeks, covering many miles of ground. The specimens which Mrs. Linnehan exhibited to us are of various hues. Some present a peculiar play of colors of delicate tints and others are like the red and yellow of a flame, and still others of a transparent milky appearance. In looks they are superior to anything we have seen coming from the opaline fields. A number of these specimens have been sent to New York to

be tested for their value, and, doubtless, after returne are received, there will be a big rush from this place to the Oreana opal fields, which are only about 35 miles from Mountain Home.

LOWER CALIFORNIA.

ZARAGOSA MINING DISTRICT.—*Lower Californian*, April 5: Mr. J. Dederick was in town this week, and went to San Diego by Thursday's boat. Mr. Dederick has been prospecting in the mountains of Lower California for the last six or seven years. He is now, he thinks, on to a good thing in the Zaragosa district. He has located with his four partners and taken possession of four gold mines, under the names of the Guadalupe, Ahandonada, Tesora and La Fortuna. The Victoria, he also claims, is within his measurements. These prospects are showing up very rich so far as development work has been done on them.

NEW MEXICO.

On Saturday last, Bell & Stephens shipped 206 ounces of gold, the result of a short run of their two-stamp mill at Pinos Altos. The mill is pounding away every day on ore from their claims on the Pacific vein. Another good shipment of bullion will soon be made. One of the best paying properties in the United States, in proportion to the number of men employed and capital invested, is the Inez mine at Cook's Peak. With a working force of from two to nine men, it has paid the following dividends for the last three months: January, \$5100; February, \$1750; March, \$4352. These are net profits after deducting any and all expenses. Work was commenced sinking on the Pacific Company's shaft at Pinos Altos this week. The shaft is 205 feet below the tunnel level, which is equal to about 400 feet from the surface. In the bottom of the shaft there are two feet of good ore. Ore to supply the mill is now being taken from the level above the tunnel and from a level 75 feet below. There are large bodies of ore developed and ready for extraction. The Lone Mountain M. & M. Co., of which John Brockman is general manager, shipped five bars of bullion this week. Under the careful and efficient personal supervision of Mr. Brockman, this mine has become one of the best paying and most reliable producers in the country. J. C. Berry & Co. will ship a carload of high-grade ore from their Georgetown mines to-day. The mines are being worked by leasers to a great extent, the company employing about 10 men on day's pay. The higher grade of ore is shipped to the smelting works, while the second-class is piled on the dump to be milled in the future. The mill will be started as soon as the water question is definitely settled.

CAMP FLEMING.—Peter Mungall and Charles Metcalf brought in a batch of ore yesterday for shipment. The ore was taken from their Gulconda mine, which is located in Treasure Hill basin, about one-half mile north of Camp Fleming. The ore, which is very rich, will be shipped to El Paso. The last shipment ran 391 ounces in silver per ton, and 31 per cent lead. A level has been run 200 feet on the property, and a winze is now being sunk at 150 feet from the mouth of the tunnel. An exceedingly rich ore, with a copper base, was struck at the end of the tunnel. Some of it gave assays of 1032 ounces silver and one ounce gold per ton. John Dodd and Dutch Henry have leased the old Penrose bonanza from Walter C. Hadley. Last week they shipped a sack, weighing 80 pounds, of nearly pure horn silver, which will bring them several hundred dollars. This week they have taken out nearly 200 pounds of similar ore. The ore is found in the debris, and not in place in the solid formation. It was the discovery of a boulder of this ore which produced the great stampede for Camp Fleming in early days, and led to the discovery of the Old Man mine, which has since produced such an immense amount of silver. The original boulder was broken up and sold for over \$3000.

UTAH.

DZAP SNOWS.—*Salt Lake Journal*, April 7: The elements have been "foresight" the mine-owners this season, yet we can see an appreciable increase in the tonnage of ore offered of late on the Salt Lake market. In the Wasatch range deep snows have interfered in mining enterprises, while to the south and west bad roads, as well as heavy snow in places, have retarded the movement of ores from the mines to the railroads. Within a month, however, we expect to see the mining industry in full activity, especially in our lead and copper camps. We expect that Beaver county will come to the front with her mines this year. Of course there is one noted producer in that county—the Horn Silver—which, like the poor, "we always have with us." It is an old standby, and to-day looks good for 20 years to come, as many dividends are exposed to view in her underground workings. We refer especially, however, to the fact that several new producers will, in all likelihood, be added to the shipping list from that region this season.

STRIKE AT BINGHAM.—*Salt Lake Journal*, April 8: Alex. Johnsen, foreman of the Petro mine, who came down from Bingham last night, tells of an important strike made in that property. For some time the company has been at work driving a tunnel from the Cottonwood side of York hill for the purpose of draining the mine and facilitating its working. This tunnel, which is 6x8 in the clear, is in 500 feet. At its face an upraise was started, and at 400 feet a big ore-body was cut yesterday that will run 50 per cent lead, 12 ounces in silver and about \$8 in gold. Connections with the upraise and upper workings will be made in 30 days, when the mine will be thoroughly drained and all ore and waste will be taken out on the Cottonwood side. The company has 500 tons of ore in its ore-house ready for shipment as soon as the roads become settled. It has a good reserve fund in the bank, and is in an excellent financial condition.

FRUE ORE CONCENTRATOR

OVER 3200 IN ACTUAL USE.

Manufactured under Patents of April 27, 1880; September 18, 1883; July 24, 1888; and March 31, 1891.

SAN JACINTO ESTATE, LIMITED,
Office of General Manager,
P. O. Address, South Riverside, San Bernardino Co., Cal.
CALICO, Dec. 18, 1891.

MESSRS. ADAMS & CARTER, 132 Market Street, San Francisco, Cal.—GENTLEMEN: After a continuous trial of different concentrators comprising the Frue Vanner, the "Holland," "Paradox," "Triumph" and the "Woodbury" concentrators, extending over several months, we find that we prefer the Frue Vanner, as it is easier of adjustment, runs smoother, has less wear and tear, and—having a positive travel—gives less trouble than the other more complicated and ever changing machines now in use here. The Frue Vanner not only saves cleaner concentrate, but has less loss in the tailings, and is in several ways preferable to the other concentrators here.
I am, my Dear Sirs, Yours faithfully,
S. HARRIS, Manager

For any information, or for pamphlets, or for circulars or testimonials, call on or address

Price of 4-foot wide Plain Belt Frue Vanner..... \$550, f. o. b.

Lead Ore Roasting Furnace.

California produces between 3000 and 4000 tons of lead ore a year averaging about 47 per cent lead. Inyo county is the chief source of lead ores in California. About 80

dorff, E. M., are a number of illustrations of jigs, furnaces, etc., and among them the modern roasting furnaces shown on this page. It is intended for roasting lead ores. The charge is introduced at the flue end, through two openings shown in cross section *C D*. It is spread over

THE report of the Atlantic Mining Company of Lake Superior for the year 1892 states that the quantity of copper produced was 1852 tons (2000 lbs.), and the cost of production 10.84 cents per lb. (including .27 cents per lb. for construction). The average price realized was about 11.9

A MODERN ROASTING FURNACE FOR LEAD ORES.

per cent of the lead ores delivered at the Selby Smelting Works are sulphides containing some zinc, and often considerable quantities of arsenic and antimony. Extensive deposits of carbonate existing in the southern part of Inyo county and the northern part of San Bernardino county are situated in localities difficult of access, and where lack of water and fuel makes mining and smelting extremely difficult.

In the article on Lead-Smelting in the last published Report of the State Mining Bureau, by P. C. von Peters-

the bed and gradually moved toward the fireplace *G H*, which is separated from the working bed by a hollow firebridge, shown in the plan and cross-section *A B*. The furnace has nine working doors on each side. Through the two nearest the fire-bridge, shown in section *E F*, the roasted ore is raked out.

AMERICA sent the first three months of this year 5191 tons of copper to Liverpool and South Wales. During the same period last year we sent 6082 tons.

cents per lb. That of the Quincy Mining Company of Lake Superior gives the quantity of copper produced at 5552 tons (2000 lbs.), the cost of production 8.77 cents per lb. (including 1.97 per lb. for construction), the average price realized 11.26.

THE hoisting works of the Gold Bank mine, at Forhes-town, Butte county, were destroyed by fire Sunday. W. W. Stow is the owner. The loss is estimated at \$15,000. Seventy-five men are thrown out of employment.

Comment.

As soon as the snow is gone from the mountains and the roads get into condition there will doubtless be numbers of men going into the mining regions in search of gold mines. That is, not searching to find new claims, but looking after such as may be purchased. Mining capital is sure to come to California before long and some of it will be with us this summer. Investments will be sought in gold properties by many who have had to give up silver mining owing to the depression in that metal. Miners in California, however, need not expect to be called upon by purchasers who want a mine right off and are ready to pay any price for any sort of claim showing gold prospects. The men who are looking for gold mines now know generally something about mines and are not going to make big investments in 15-foot "shafts" or 25-foot tunnels. They are not hunting for gopher holes, but mines. There are plenty of them here and those who own them will have a chance to sell if at all reasonable in their demands.

Ever since its establishment five years ago, the Cogswell Polytechnic College of this city has been in more or less difficulty, notwithstanding its million-dollar endowment. The college was intended for the promotion of manual training. Troubles arose between its founder and the trustees and the school was finally leased to the San Francisco Board of Education at a nominal rent, its name being changed to the Cogswell Mission High School. It has since cost the city \$20,000 a year to maintain it. As the result of recent litigation the trustees have decided to retire as soon as Dr. and Mrs. Cogswell announce their successors. The college, with its shops, furniture and grounds, is valued at \$125,000. After January next the annual income from the endowment will be \$20,000 for twenty years to come. With this sum it is estimated that the institution can accommodate 200 students free of charge and still have a surplus of a few thousand dollars each year. Dr. Cogswell states that he has now no desire to break the trust, but that he intends to continue and to improve the college. The trustees have not yet been selected and probably will not be until the opening of the term in July. The building of a foundry, the furnishing of the machine shop, and the adding of a varied lot of tools to the blacksmith shop are the more notable improvements attended to by Dr. Cogswell. It is also likely that Latin, German, French, etc., will be abolished from the course of study next term, and that cooking will be added for the benefit of the girls. At present there only some 175 students enrolled, but two years ago there were nearly twice as many. The course of study now pursued is similar to that in the city high schools, with the addition of the manual training. It is sincerely to be hoped that the eccentric doctor will soon carry out his original intention of making this a regular trade

school. That there is a demand for such a thing is shown by the attendance when the institution was first opened.

It is very certain that it will not be long before miners' wages in the other Pacific Coast States and Territories will come to the standard in vogue in California—\$3 per day. It is higher than this elsewhere, but on many mines in Montana, Idaho, Colorado, Nevada and Utah, owing to the low price of silver have closed down, that there are many miners out of work. Moreover these properties can not be worked under present conditions of salaries and wages and will not start up unless a reduction takes place. The miners will naturally object to this and there will be more or less trouble, but the reduction is bound to come before long. We are not urging this lowering of miners' wages but simply stating its probability in view of the condition of the mining industry. To be sure if silver should take an unexpected upward course with any show to remain at its former value the mines would again be worked and pay the old scale of wages. There is no immediate prospect of this however, and the mine-owners are not apt to work their properties for the sole privilege of paying their workmen good wages.

The largest quartz mill in the world is now being erected at the Lanlaagte estate, South Africa. The mill will work 1000 tons a day and is built specially for a MacArthur-Forrest or cyanide process plant. The tanks are 40 feet in diameter and 9 feet deep, having a capacity of 400 tons each. People in this State who have turned up their noses at the cyanide process as not "practical" because it did not work on their particular ore, should make note of this. The Robinson mine, the greatest gold producer of South Africa, has been working 75,000 tons of tailings a year by this process, and making money out of it. Several other mines there are using the system, and now comes this big plant. As the single camp of Witwaterstrand, South Africa, is now turning out more gold yearly than the whole State of California, perhaps its experience is worth something. But people who try to run a chemical process without a chemist, and by mere rule of thumb are not apt to make such a success of it as those who are more systematic and thorough. Of course, we very well understand that there is a difference in classes of ore, and this process is better adapted to some than to others.

At the Mayflower drift mine, on the Forest Hill Divide, they are prospecting a cross or "robber" channel by means of a boring apparatus. A seven-inch hole is bored and piped, just as an artesian well would be sunk. The object of this is to find the center of the channel. There is already a tunnel from which a drift can be run when they find the exact course of the channel and ascertain its center. They are boring a series of holes, the deepest of which will be about 300 feet, it is estimated. The exact course of the channel is undetermined, though its general course within a certain width is known. The boring operations will locate it exactly and there will then be no guess-work in running the drift from the tunnel. This work is not being done on the main Mayflower channel, but on one which crosses it. The result of this work will be looked for with interest. Where boulders are apt to be encountered, this sort of boring is rather difficult, but it seems a comparatively cheap way to prospect, and the wonder is it has not been more frequently adopted.

The San Francisco delegation to the Trans-Mississippi Congress, which meets at Ogden on Monday next, held a meeting this week. The delegation indorsed by resolution the Nicaragua canal and voted down one asking enforcement of the Geary Act relating to Chinese. Ex-Senator Cross introduced a resolution which recited the fact of Congress having passed the Caminetti bill and the California Legislature having donated \$250,000 for the construction of impounding dams when Congress shall have done the same, and in conclusion urged the Senate and House of Representatives to act at an early date on behalf of the mining industry by appropriating the hoped-for \$250,000. In support of his resolution Mr. Cross told of the death of hydraulic mining and the great loss suffered by the State in consequence. He said that gold was in greater demand now than in many years and the financial houses of the world were suffering for lack of it. The miners were eager to get to work without injuring the navigable waters of the State, and if impounding dams were erected all would be well. Of course a Sacramento delegate opposed this resolution; and so did one or two from this city, but it was finally carried, as the mining men were in a large majority. The anti-debris men will finally be forced to recognize the fact that the people of this State want hydraulic mining resumed if it can be done as now proposed. The narrow-minded local prejudice of the valley districts will have to give way in the end and they might as well do this gracefully. The State

Legislature, Congress and the courts have all spoken in favor of the industry within the past six months and anti-debris agitators will soon be out of a job.

Ore Reduction Works for San Francisco.

We have before noted the increase in the receipts by sea at this port of ores from Central America and Mexico. Formerly this was all sent to Europe or to the Colorado smelters, and quite a proportion still goes in those directions, but more and more is sent here every year. The Portland Smelting Company, which is about to establish smelting works on the bay of San Francisco, will probably attract additional quantities of this foreign ore as they propose to furnish exceptional facilities if they can carry out all their plans. There is no reason why San Francisco should not become a great ore-reducing center, except the high freight rates of the railroad companies. Of course they cannot well control the ocean carrying trade in this respect and with additional smelters here the ocean shipment of ores should largely increase.

But with more reasonable rates on ores the smelting works already in operation and those to be established could have all they wanted to do. California ores from the extreme north and extreme south could be brought here as well as those from Nevada and Arizona. The sales are almost prohibitory, and are very high even for concentrates. Moreover, they have a system of charging in proportion to value instead of by mere weight alone, which practically compels miners to work their ores at the claims, not work them at all or give a large proportion of their contents to the transportation companies.

This is an evil which should have been remedied long since. Two years ago a representative of the Portland Smelting Company tried to arrange rates on sulphurets so as to establish a branch here. The railroad companies, however, were not liberal in their policy and the project was abandoned at the time. The works are now to be built, however, and it may be that the railroad companies have seen the error of their ways. Meantime sulphurets from Grass Valley have been shipped as far as Portland, Oregon, to be worked.

With two or more smelting companies in the market for ores, the miners of this State and Nevada should be greatly benefited and many more mines be opened. With ore purchasers ready to buy and make advances, claims could be operated which are now idle, as there are many where there are no reduction works. The Union Pacific has built up an immense business by encouraging the mining industry, but no such policy has been adopted by the companies controlling the California traffic. We are very glad to see that new smelters are to be put up near San Francisco. There is room for others and should be business for both companies. With ores coming both by sea and land, there would be encouragement for men to operate in many old districts which are now very dull.

It seems that Mr. C. P. Huntington, President of the Southern Pacific, after reading a telegram about the establishment of smelting works here, says he will write to the railroad officials in San Francisco to take ores at any price that does not cause an actual loss on transportation. That sounds like business and it is to be hoped he will carry out his idea. The action of the road in the past has not been in the direction of cheap rates on ores by any means. Their plan of charging by value of the ore shipped has prevented richer ores coming here, and poor ones would not pay to ship. If Mr. Huntington has at last had his eyes opened to the evils of this policy, it will be a good thing for the mining industry of this coast.

THE State Miners' Association has sent as delegates to the Trans-Mississippi Congress, Sam K. Thornton (with Chas. G. Yale as alternate), and Julian Sonntag (with T. L. Ford as alternate). Several other members of the association, including C. W. Cross and Robert McMurray, have also been appointed by the Mayor.

MR. FELIX CHAPPELET, of the Mayflower mine, Placer county, who has been confined to his home with erysipelas, is now on the road to recovery. His illness was brought about by striking his head on a timber in the mine, and he was at one time very ill.

THERE were 22 cases of ores and minerals, weighing 2500 pounds, shipped to the World's Fair from Grass Valley last week. There are many rich specimens in the collection, but most of it is milling ore, representing that being daily worked in the mines of the district.

A CONTINUANCE of the agreement for restricting copper production until the end of this year has been practically arranged between large European and American producers.

Progress of Mining in New Zealand.

Dr. A. Scheidel, of Auckland, New Zealand, arrived here on the last Australian steamer on his way to the World's Fair, with credentials from the governor of the colony. While here he will make a study of our metallurgical and mining operations. He left for Grass Valley on Wednesday, and will afterwards go to the Comstock before going East. Dr. Scheidel is the manager of one of the largest of the New Zealand mining companies, the Sylvia, at which place he has made a special success with the cyanide process, treating large quantities of concentrated sulphurets and obtaining a very high percentage of the gold. He is an enthusiastic believer in the merits of the MacArthur-Forrest process as applied to refractory gold ores, his success with it at the Sylvia mine leading him to believe that it is the most important metallurgical improvement of the age. In an interview with Dr. Scheidel we obtained the following information concerning the mining industry in New Zealand:

New Zealand offers many facilities which very few other countries possess, as mineral and metalliferous ores are distributed throughout the colony. The reef regions near the west coast of the southern island and the fields and district of Auckland are densely wooded and well watered. The alluvial drift on the southern island commands an ample water supply. The larger rivers are used to supply motive power for mining machinery, and in those districts where no water power is available, the rapid current of creeks at a distance is used for the generation of electric force, which is transmitted to such places less favored by nature. An instance in point is offered by the Skippers mine in Otago, where a 30-stamp battery and all additional machinery is driven by electricity transmitted over a range upward of 2500 feet high for a distance of two miles. Electric power is used in other instances for working dredging machinery. For instance, in the Shotover river, their gold-bearing gravel is lifted by power generated at a distance of 1½ miles from the dredger.

The mineral wealth of New Zealand is very considerable, and its resources are not at all developed as they deserve to be; but it must be confessed that all efforts are being constantly made to take advantage of new scientific discoveries and improvements in machinery, and, with the help of concentrated capital, the mining industries of the colony would soon reach that stage of prosperity which the natural conditions prognosticate. The mining industry has suffered in consequence of the failure of companies, which spent all their money in the erection of plants before thoroughly prospecting their ground, so that the prosperity of the mines became impossible when an income was most important. The title to claims should be made more secure for the bona fide holders.

Gold is being found all over both islands, in alluvial drift in the southern provinces, on the west coast of the middle island, in the reefs of the west coast of the middle island and in the mining districts east of Auckland where the country from Cape Colvill to Te Aroha for an extent of eighty miles is gold bearing. The famous Thames gold field is situated there. Its fame once spread all over the world and it is only necessary to quote the Caledonia mine which produced in one year £1,000,000 worth of gold to recall those early days of the field when 20,000 men were occupied in carrying on the operation in a very small area which rivaled in wealth the most famous gold deposits. The Thames field has during the last few years been diminishing in gold production, but such excellent plants as that of the Sylvia where concentration and treatment of the concentrates by cyanide is carried on on a large scale, and the prospecting of the lower levels, will again place the Thames field among the large gold producers of the Australasian colonies. New fields are constantly reported in the upper Thames district, and there can be no doubt that the Hauraki gold field will have a splendid history of which the present results are only the opening chapters. The gold production of New Zealand amounted in 1891 to 251,000 ounces of a value of £1,007,172. This is the largest output since 1880. The returns this year will be considerably larger in consequence of large plants commencing work on the rich quartz lodes.

The total gold entered for exportation up to the end of March, 1892, amounts to 12,131,583 ounces, of a value of £47,679,191, and, beyond doubt, a considerable amount has been taken out of the country without authorization, so that the total value since 1852, when gold was first found by C. Ring, an old California miner, would far exceed that figure.

Silver has been found in all the goldfields of the colony. The gold of the fields of the north island contains a large percentage of silver. The gold at the Thames and Cromandel contains between 25 and 33 per cent of silver, and varies consequently from £2 13s to £3 per ounce. The banks separate the silver from the gold by the Miller chlorine process. The total export of silver up to the end of 1892 amounts to about 600,000 ounces, of a value of £140,148. Of late a large number of silver lodes have been found at Puhipuhi, but the prospecting and working of all the fields have been carried on with very little energy. The methods for silver extraction at disposal proved unsatisfactory. The Government should always help any industry when difficulties arise. A flourishing field does not need any assistance, but everything should be done to help bring matters to a satisfactory issue if technical difficulties arise. No systematic mining has been carried on in either district where silver lodes are found.

Copper ore has been found and worked in many parts of the colony as far back as the earliest times. Prospecting is still being carried on with success, and the colony may one time take its place among the copper-producing countries. The total value of copper exported up to the end of 1891 amounted to £17,866.

Antimony is found together with gold and silver in

many of the quartz lodes, chiefly at Ruhihubi, Thames and Te Aroha, but no attempts are made in these localities to turn it to profit. A large antimony lode is being worked at Endeavor Inlet, and deposits of some magnitude have recently been discovered north of Auckland. The total amount of ore and star antimony exported from the colony up to the end of 1891 was 2786 tons, representing a value of £41,140.

Manganese ore, chiefly per-oxide, is found in many places and has been profitably worked for many years. The total value exported up to the end of 1891 amounted to £53,925, representing 16,456 tons.

Chrome ore is found in the district of Nelson, but no work has been done there of late. The lodes are well worth further prospecting. The value of the ore exported amounts to £37,367.

Lead is being found in the form of galena, particularly on the Hauraki fields, in combination with zinc blend. No attempts have so far been made to turn it to profit, but opportunity may offer itself in consequence of an extended introduction of concentration.

Iron is found in very large deposits in various districts and forms. The beach between Manukau and New Plymouth is covered with impure magnetite. Brown iron ore is found in the district of Auckland, and magnetite and hematite ores in large deposits at Dunston, in Otago, and at the Dun mountain in the province of Nelson. There is an enormous deposit of hematite at Parapara, in the same province. There is bituminous coal at a distance of a few miles, and large deposits of limestone adjoining the hematite. All such deposits are within a mile of the ocean beach, where large vessels could be loaded after the construction of wharves. Large iron works with Hohovens, puddling furnaces and a rolling-mill are erected at Ouchunuga, near Auckland. It is to be regretted that more judgment has not been exercised in the erection of such a splendid plant by selecting a more suitable location for procuring the raw material at low cost, and it may prove still advisable to shift the whole plant to the Nelson district, where the facilities are more of a nature to make the industry a financial success. There is no probability of competing in the world's market, but there appears to be a splendid opportunity for well-managed works to supply some of the Australian colonies with a greater part of that useful commodity. To make use of the magnetic oxide of iron sand found on the beach near Manukau and Taranaki for the manufacture of iron will hardly pay at present, as that sand must first be brought into suitable form for smelting, which procedure demands practically the making of an artificial iron ore, a process which hardly recommends itself as being a suitable one if high-grade ores are found in such favorable situation as is the case in the Nelson district. Small samples of iron made from such sand appear to have given satisfaction otherwise.

Cinnabar is being found in many localities, but up to date nowhere in such quantities as to be of commercial value. The Bay of Islands district gives indication of large deposits being near, as the black mud near the hot pools at Ohaeawai contain small globules of mercury and give the usual indications of ore deposits.

Tin has been found in the south of Stewart's Island, but no financial success has so far accompanied the attempts to work either the gravel drift or the lode in the remarkable ranges.

Mineral oil is found in various places on the North Island and on the sea beach at New Plymouth, also in the neighborhood of Gisborne. Several bores have been put down as deep as 1700 feet but yielded no continuous supply. Of late a mineral oil lease has been taken up about twenty miles from Rotorua, and the results are being looked forward to with interest.

The bituminous coal measures of New Zealand are of very great extent, and the coal, especially from the west coast of the middle island, is equal to the best anywhere. The output of coal, which amounted in 1878 to 162,218 tons has increased in 1891 to 668,794 tons. The deficient state of the harbors on the west coast interferes with the exportation of coal, but the works now in construction will offer such facilities as will increase the export. Some bituminous coal is being found in the north of Auckland, in the Bay of Islands and near the banks of Waikati river. It is useful for domestic purposes and some local industries. The total output of all sorts of coal since records have been kept amounted in 1891 to 7,131,196 tons. New mines now being opened will still further increase the production, and after suitable wharf facilities are provided the coal mining industry will become one of the most important of the colony. It may be mentioned that H. B. M. Calliope steamed out of Samoa during the disastrous hurricane, using Westport coal; and that Sir John Goode declared in his presidential remarks addressed to the Institution of Civil Engineers in London, that the bituminous coal found on the west coast of the middle islands of New Zealand is considered by engineers to be fully equal if not superior to the best description from any part of the world.

Kauri gum may be mentioned among the mineral products of New Zealand, since, although originally a product of organic nature, it may be spoken of here on account of its fossilized character. The gum is obtained only in the northern portion of the northern island, and in no other place. Some gum is exported from New Caledonia, of seemingly equal appearance, but of an inferior quality and of small value. Kauri gum is the product of kauri forests which long since became a thing of the past. The gum was formerly found near the surface, but is now being obtained from below by digging, or in some districts and localities by plowing. The gum is used principally in the manufacture of varnish. The United States is among the principal consumers, and it would seem that the export duties should be taken off this useful product. Upwards of 5000 men are employed in the gum fields. Digging gum has been a great resource for many men who started in life in the colonies under good auspices, and it has been a great help to the district of Auckland when the colony suffered under financial depression. Competent persons

estimate that the gum deposits will last for 50 years to come, but it is hardly possible to form any exact idea. To show the importance of this gum industry, it may be mentioned that the total production up to the end of last year amounted to upwards of 150,000 tons, of a probable value of £650,000,000 sterling. The export in 1892 amounted to £480,000.

In reference to the metallurgical features of New Zealand, it may be said that the colony has been for years the peaceful field for inventors and introducers of processes for the saving of gold and silver. Not all of the processes which have been introduced in the colonies have been successful, but each one has done some good by diffusing knowledge of matters and machinery among the mining population. The battery used on the fields of the North Island are of the latest designs. Large plants for dry and wet crushing are found on the Hauraki field. The special feature of the gold and silver metallurgy during the last year has been the introduction of concentration plant and extraction with cyanide of potassium, commonly called the MacArthur-Forrest Process. The Sylvia Gold and Silver Mining Company at Taranu erected some years ago a concentration plant on the so-called German plan. The ore of that company is of a complex character and contains a high percentage of galena. It became therefore necessary to make slime concentration a special feature of the plant. The company added about a year ago an agitation plant for treating the concentrates with cyanide of potassium. The results have been in every respect satisfactory in the extraction of about 96½ per cent of the assay value the ore. Other mines have adopted the same process for extracting the raw ore by means of what is called the percolation process, and indeed it seems that the gold ores of several districts, like those of Kuotuna and Karangahake, are particularly suited to such treatment, as they contain gold in a very finely divided state. It is my opinion that the cyanide of potassium process is the most important addition to metallurgical knowledge of gold extraction and by the general adaptation the output of gold will be vastly increased. I am, of course, aware that in the few things I have told you about the mineral industries of New Zealand, I have not given anything like an exhaustive description, but a fair general idea may be gained.

Coast Industrial Notes.

THE telephone line that is to connect Hanford and Fresno is nearing completion.

IT is reported at San Bernardino that the Harqua Hala mines in Arizona, owned by Hubbard and Bowers were sold Wednesday for \$1,000,000.

THE force at the Mare Island Navy Yard at the present time is larger than it has been for many months past, 650 men of all branches of labor being employed.

THE building of the Los Angeles Times is now lighted by electricity furnished by its own dynamo. The lighting plant is operated by the same engine that runs the press.

SANTA CLARA pays \$9000 per annum for water and \$3000 for light, which causes the Journal to urge the town to become the owner of the water works and an electric-light plant.

THE irrigation company said to be backed by \$8,000,000, to bring the desert under cultivation in the Valley of New River in eastern San Diego county, has begun operations by putting a large surveying party in the field.

THE Oroville Mercury is urging the formation of a co-operative company there to erect a fruit cannery. The growth of deciduous fruit orchards in the vicinity of Oroville the last five years has been almost phenomenal.

DAVID POWERS, who owns a farm at Blue Lake near the depot of the Arcata and Mad River R. R. Co. has found coal on his place. He had spent some money prospecting, but a big landslide a few weeks ago revealed what he considers a large body of coal.

THE Vance sawmill at Eureka, Humboldt bay, will run nights as well as days hereafter to fill orders on hand. This will make the output of the mill over 80,000 feet of lumber daily. The prospect for a very active season in the lumber mills at Humboldt is bright.

THE Harbor Commissioners at their meeting decided to raise the monthly rental of the big coal bunkers at Valjejo-street wharf and the adjacent seawall lot, which were lately purchased by Goodall, Perkins & Co. from the Oregon Coal and Navigation Co., to \$200 from \$62.50 a month.

SAN DIEGO voted by a majority of nine to one to issue \$665,000 in bonds for the construction and ownership of a system of water works. That city has long suffered from an inadequate water supply, and so when the people were given a chance they made their expression of a desire very emphatic.

THE White Pine News says: Several letters have been received by the News office during the last week from people who wish to come here to look for work. To all such inquiries we can only say: There is no work to be got here at the present. As soon as there is, the News will make a note of it.

THE town of Haywards was recently reincorporated so that an elaborate sewer system could be established. County Surveyor Nusbaumer has submitted plans for a system which the trustees are now considering. The drainage is to be in the Bay of San Francisco, and the total cost, for which bonds will be issued, will be about \$25,000.

THE bids for the new crane for the stone drydock at Mare Island having been found by the department to be greatly in excess of the estimated cost new bids are asked for, to be opened the 6th of June. This will give the San Francisco works an opportunity of putting in their bids. The crane is to be completed within fifteen months after the contract is let.

A MEETING of the executive committee of the Traffic Association of California was held Tuesday. A resolution was adopted endorsing the scheme of the Merchant's

Freighting Association to raise a guarantee fund for the establishment of a competing line of coastwise steamers between San Francisco and Redondo and San Pedro. A guarantee fund similar to that used in starting the line of clipper ships is wanted.

OVER & NAGLE, sub-contractors for the building of the new 19,000,000-gallon reservoir for the San Diego County Flume Company, this week sent a number of men to the reservoir site, where the iron pipe and flume proper connect. Work was stopped some weeks ago for lack of material, but will now be pushed to completion, which will take some two months more. The reservoir will contain an extra supply for the use of San Diego.

A PRIVATE MEETING of ship-owners was held Wednesday and it is understood that they are about to make an agreement with boarding-masters to have them furnish crews throughout the coming summer. Men for deep-water vessels are to be furnished for \$20, for island vessels at \$25 and coast and lumber vessels at \$30 per month, which is a general reduction all through. This will throw the business into the hands of the boarding-house men almost entirely.

The unemployed workmen of this city have presented to the supervisors a petition for relief, and point out several methods. One is to raise \$100,000 by subscription to employ men in the Golden Gate Park. Another is to spend money in improving the sanitary condition of the city and spending \$500,000 in cleaning up. The third proposition is to improve the Panhandle extension of the Park by day's labor. The supervisors have the matter under consideration.

THERE is again talk of an opposition ferry to Oakland, this time it is for freight service only, and the projectors are the Whitney Transfer Co. A steamer has been secured and is now being overhauled, and in a few days it will be christened "The Whitney Transfer." There have been 2000 shares of stock issued at the par value of \$50 each. The opposition boat will commence running about May 1st, when all the merchants of Oakland will be asked for patronage.

THE lathers of Oakland are trying to raise the prices of their labor. Lathers now receive \$1.25 per 1000 laths. It is claimed that at this rate the best men can make but \$1.75 a day. They want an increase to \$2.25 per 1000 laths. At this rate the best men could not make more than \$3.50 per day, while the average man would receive about \$2.75 per day. The men also make the further claim that they only work on an average of four days a week the year round, and the new rates will only allow them a fair living.

LOUIS SLOSS, John D. Spreckels, James B. Stetson, George C. Perkins and W. F. Whittier have petitioned the Supervisors of San Francisco for a franchise to lay down and operate in this city underground conduits with the wires or other conductors to be contained therein for the transmission of electricity for telegraphic, telephonic and other purposes for which electricity may be used to transmit intelligence by signals or sounds. The privilege to make all necessary connections to subscribers is asked. The franchise is for a term of 50 years and \$50,000 is to be expended during the first year. The city is to have the free use of the wires for police and fire-telegraph service.

THE number of vessels leaving this year to salt down salmon is on the increase. Last year the salt-salmon pack in Alaska, outside of the canneries and fresh fish put up in cans, was very large. The whole catch, however, brought good prices. The combination among most of the Alaska salmon canneries and the limit of the pack in cans has opened a demand for salmon salted in barrels that has encouraged a great many to fit out small craft for fishing trips north. The sending to Bristol bay last week of the three-masted schooner Mary Dodge was a notable event in salmon fishing for salting down. The Dodge had 1600 empty barrels and 14 tons of rock salt. Each of the 12 fishermen shipped on a lay of 7 cents a barrel or \$112 for the trip, provided each one of the 1600 are filled. They are of course found for the trip and their return depends upon how well the salmon run in Copper river and Bristol bay this year.

THE Oakland City Council, the other day, considered the application of the Twelfth-street Electric Railway Company for an extension of time for completion of the road, and granted it, but added as conditions that the company must run electric lights, one to each two blocks, and must stand the expense of widening Pine and Wood streets by narrowing the sidewalks. The attorney for the company protested against these conditions. Finally the company went ahead and rushed the work so as to get the road in operation by the terms of its first franchise. It set up the poles, rigged temporary wires, borrowed two cars, got the current from another company, and triumphantly ran their two cars over the road before its original franchise expired, thus evading the added conditions of furnishing street lights and widening a street. It was very rapid work indeed, there being only a few days in which to do it. The road will now be put in permanent order and continue running.

AFTER being in business for over 20 years, the Huntington-Hopkins Company intends dropping a very important branch of its trade. The firm has sold to George W. Gibbs & Co. its sheet and bar iron business. The reason assigned for this partial retirement is that it does not pay for the capital invested in it. In the days when the company, having already established its hardware business, decided to add a sheet and bar iron trade, profits were larger than they are to-day, and competition was less. The firm believes that one branch of the business is quite enough to attend to. The stock of iron and the good will have been disposed of, and the large quantities of material stored in the big building south of Market street, running through from First to Fremont street, will be turned over to the purchasers. Most of the large manufacturers now have their own agents in this city, so that the sales of sheet and bar iron by those in the ordinary hardware business are comparatively small.

Uniform Currency.

TO THE EDITOR:—In a former letter, on "Money," I have suggested that a given quantity of precious metal may be made the perpetual basis of a corresponding volume of sound money, that is, by the State purchasing the metal, paying notes to an equal value, and keeping it. Under such a system there would be many advantages, some of which were pointed out, and if any person should prefer to hold his wealth in the form of precious metal, he could buy gold or silver bullion for the legal tender notes, and reconvert it at pleasure, with a trifling sacrifice to compensate the labor involved. I now propose to show how simply and easily the volume of currency may be maintained and its unit made nearly uniform, as a means to the exchange of service. For the sake of clearness, I will suppose gold to be the metal selected as the chief basis of the currency, with silver as an admissible auxiliary, a "good second."

Toil, labor, service, hence values, may be measured by means of any concrete product of toil. Many different substances have been and are used in different parts of the world and at various epochs, salt, codfish, tea, and silk among the number, and such things have at least this advantage over gold and silver that, if one cannot spend one's money, one can yet make use of it. I have been in places and circumstances in which a pound of codfish would have been worth more than a double eagle to me.

But perishability is a serious objection to the use of those things as money, and although brass, iron, lead, copper, tin and bronze are on record as having been coined, the preference of nations has generally been for gold and silver, the least destructible of the metals, except platinum which is too scarce. Gold is in demand all over the world. Why this is so, I leave to the fishers to explain; but the fact is the reason why gold seems to be the best standard of values in concrete form. The value of an article depends not upon what it has cost to get, but upon what it would cost to replace, coupled with the desire to have, for it is clear that, if gold could be got for nothing, no one would give anything for it, no matter how much it might be in demand, nor how much trouble its getting might have cost previously, and if no one should want gold it would be worth nothing, however scarce and hard to get.

Though gold may be used as a standard, it does not follow that it must be coined and used as money. As I have said before, it is an imperfect standard because its own value fluctuates. This imperfection may be corrected.

Let the unit of value be \$1. Let that unit of value equal the unit of toil, and let that unit of toil, and therefore that dollar, be represented by a certain fraction of an ounce of gold. But the value of the ounce of gold, that is, the number of units of toil that it represents, varies according as gold is easier or harder to get, hence the weight of gold to represent and equal the unit of toil, and consequently the unit of value, the dollar, must also vary. In other words, let it be decided at a given date that a given weight of gold represents one dollar, and thereafter change that weight as gold may appreciate or the reverse. This plan might be objected to on account of the disturbance and cost of recoinage; but why recoin or coin at all? Let the gold be paid for with legal tender notes and remain in the treasury, as is now done to some extent with silver.

When, at suitable intervals, the notes should be called in for replacement by new notes, let the weight of gold to the dollar be readjusted in conformity with the commercial value of gold, issuing a greater or less number of the paper dollars and giving to each person turning in notes a corresponding percentage of increase or decrease. During the intervals between the readjustments prices would rise or fall as gold might fall or rise, but the readjustment would restore normal prices and the variations would not be very serious in a period of five or even more years, or a special readjustment might be made when necessary to maintain the approximate immutability of the dollar.

During the reissue of notes, in case a readjustment had occurred, there being two kinds of dollar notes extant, the old and the new, both of which could not properly be legal tender at the same time, a time must be set after which the new issue would be the only legal tender, the notes being ready for delivery at suitable places in exchange for old notes representing an equal weight of gold (not each dollar but in total sum). At the same time all debt and credit accounts must be corrected by a percentage corresponding to the change in weight of the gold dollar—a simple operation and not required very frequently. Each issue of notes should be distinct in color and design, and should show the date of issue and the weight of gold to the dollar.

The system could be made to so regulate the gold market as that fluctuations would be minimized, while the volume of the currency could be kept at a nearly uniform amount *per capita*. This would be done by the Government buying or selling gold bullion, always giving or receiving notes in exchange, and with a small discount or premium, as might be necessary. It will be seen that appreciation of gold would increase the volume of currency in a new issue, and selling gold for notes would decrease it; that is, the amount in the hands of the people would decrease. If gold should fall, the volume of currency would be decreased in a new issue, and the treasury would buy gold for the notes not paid out for old notes. Account would have to be taken of the increase of population between the re-issues.

As the quantity of gold procurable would not suffice to cover the required amount of currency, other kinds of wealth could be used to supplement it, and no doubt silver would be the first choice; but whatever the metal or other substance, it should be bought and sold for notes only. The precious metal required for foreign payments could be sold in the form of fine bars instead of coin.

As to knowing whether gold has changed in value during any given period or not, I think a committee of suitable men could decide by a survey of the general market for commodities, labor, rents, etc., and if the re-adjustment of the dollar should not accord accurately with the gold market,

it would approximate, and prices would readily adjust themselves. In fact the people would not trouble themselves about the value of gold, except those who might require to deal in it.

Under this system, gold, though the standard, would have a price, in dollars, varying with each re-adjustment of the dollar, the ounce of metal being always worth as many dollars as would be required to represent an ounce of gold. Thus, if the dollar note should represent the twentieth of an ounce, gold would be worth \$20 an ounce; if a twenty-third of an ounce, gold would be worth \$23 per ounce (with slight variations to cover the labor of exchange).

Well, *qui bono*? This; debtors and creditors would be protected, as nearly as possible, from injury by a rise or fall in the exchangeability of gold for other products of industry; the volume of currency would be maintained at a nearly uniform proportion to the population; the market for precious metals would be steadier; the prices of goods, wages, rents, and assessments for taxation would rest on a more nearly stable basis than now, and their proper fluctuations would be visible and intelligible, as would also those of gold; we should have a uniform, simple and sound national currency, with fewer men getting rich from the toil of the masses, and less absolute loss of gold by abrasion and by accidents.

Another advantage would be that the man who should turn in notes, either for new notes or for bullion, would not have to suffer a loss on account of light weight. This matter of light coin illustrates the distinction which Herbert Spencer makes between "absolute ethics" and "relative ethics." In strict justice, the honest man who turns in worn coins which he has received at their face value ought to receive that value in new coin; the loss ought to fall on the community; but this cannot be admitted in practice, since many would purposely abstract gold from the coin, by chemical or mechanical means, in order to make dishonest gain at the expense of the community. The use of notes avoids this difficulty.

We have now about two thousand millions of dollars in various kinds of money, or near \$34 for each inhabitant; to keep up this ratio we must add about three millions per month, on account of the increase of population. But fractional currency might be made, as now, of metal, to avoid the need for a multitude of small notes, and because coin would be more convenient for the purpose; the intrinsic value of such money is not of great importance practically.

The proposed plan is a compromise between the barbarism of coin and the dangers of a currency of "credit money." In a future letter I propose to show in a very simple way, without going back to the dawn of creation, the reason why the currency, though it may consist of paper notes, must have a tangible backing of some sort. We must make up our minds to endure some slight inconvenience until we shall be civilized enough to adopt *The Ideal Currency* in the full sense of the term. I do not expect to see my suggestions adopted, probably they would require modification; but if they have in them the germ of good, that germ may fructify in the course of time.

C. H. AARON.

Losses in Dressing Tin Ores.

Mr. James Hicks, in a paper read before the Mining Association and Institute of Cornwall, referred to the losses that have always occurred in the dressing of tin ores. In early days, when Cornwall tin mining was confined to the upper horizons, the black tin occurred in comparatively coarse crystals, and it was thought proper to crush the ore coarsely, but in the lower levels now being worked the finely disseminated mineral requires a finer crushing to liberate it from the gangue. As a consequence the screens employed have become finer and finer, until now they are No. 35 or 36 B. W. G. This finer crushing has increased the production of slimes, as have the pulverizers employed. The old methods of jigging and buddling were unable to save a high proportion of this, and as a consequence other appliances were employed, but the works are far from perfect, as may be imagined from the statement that nearly 50 per cent of the slime tin is lost in dressing.

The mines on the Carn Brea Hill, which include Dolcoath, Cook's Kitchen, Carn Brea, East Pool and other famous mines, whose tailings flow into the Red river, produced in the aggregate 7558 tons of black tin in 1890, and 8234 tons in 1891. The stream-workers on the tailings of these properties sold in 1890, 1302 tons, valued at £52,080; but in 1891 their output fell off to 879 tons 16 cwt., owing to the improvements made in dressing works, notably at the Tincroft, Carn Brea, Greeville and East Pool mines. In 1890 the tin caught by the stream-workers was 17 per cent in weight, and nearly 13 per cent in value of that produced at the works, and when it is considered that the methods employed in working the tailings are extremely simple, it is safe to say that the 405,000 tons tailings which flow into the Red river carry 20 per cent of the original contents, or about eight pounds to the ton of black tin, are lost to the mines. In the aggregate, this is a large amount—over 1000 tons of black tin annually—valued at about £100,000. But if these results are to be considered poor, those at the mines whose tailings flow in Portreath river are still worse. These mines, which include Wheat, Basset and West Basset, produced 1247 tons 13 cwt. of black tin in 1890, and in 1891, 1279 tons. The river-workers did nearly as well as the miners apparently, as mining and crushing had been done in advance, and produced in 1890, 428 tons of black tin, and in 1891, 330 tons, an average of 33 per cent in quality of that produced at the mines, and 25 per cent in value.

SUPERINTENDENT GILLINGHAM has just received a telegram from the home office in New York that the contract has been let to put in a hundred-stamp mill at the Phoenix mine, Arizona. The work will be done at once, and it will make the mine one of the best-paying in the gold-belt property.

Demands of Labor Unions.

A general strike of mechanics employed on the Exposition building at Chicago and its utter and complete collapse have been the chief incidents of the current week. In this strike the trades-unions came for the first time into direct opposition to the general Government, and were knocked out in a single round. Before this work of building at Chicago began a conference was held between the Fair managers and the trades unions to arrange and define the terms upon which the labor should be performed. The unions presented four demands, namely: (1) that eight hours should be a day's work; (2) that minimum rates of wages should be fixed; (3) that all differences should be settled by arbitration; and (4) that only union men should be employed. Of these four demands the Fair managers acceded to but two, namely, the eight-hour day and the arbitration of differences. They declared their purpose to pay full ruling wages at all times, but declined to enter into any engagement as to rates, and declined to discriminate between union and non-union men. After some parley these terms were accepted, the understanding being that the compact was to govern during the whole of the construction period; and under this arrangement the work has in fact gone on until Monday of the current week.

Although prodigious things have been accomplished at Chicago during the past year, there is still much to be done, and it has for some days been a question if, in the short time before May 1st, the buildings can be put in shape for the formal opening which the law says shall occur on that date. The trades-unionists saw in this situation a chance for which they have long been watching, to exact from this Government a definite, official recognition. In disregard of the original compact with the Fair managers, they made a demand on Saturday last that no non-union men should be taken on the work, and when this demand was refused they applied under the terms of the compact that the matter should be settled by arbitration. The Fair managers flatly refused, holding that the agreement to arbitrate related to disputes arising under the compact but not to a proposition to alter the terms of the compact. The soundness of this view cannot be disputed. If a "difference" related to wages, hours of labor or to matters of discipline had arisen, then the managers would, under their compact, have been bound to arbitrate; but when this "difference" was a proposition to change the compact itself, it became a very different matter.

The unions insisted upon their demands and on Monday, in obedience to orders from "walking delegates," between four and seven thousand carpenters and painters, not one of whom had a personal grievance of any sort, left their work. It was imagined by their leaders that the necessity of having the buildings in order by May 1st would force the fair managers to make concessions but they soon found that no concessions would be made. It was announced that the vacant places were open to all comers and some hundreds of non-union men soon appeared and were set to work. Arrangements were also made to bring in workmen from Joliet and other near-by cities to fill the places of the strikers. The trades-union men stationed committees at several gates leading to the fair grounds and sent other committees to meet the trainloads of incoming mechanics, and persuasive efforts were made to keep them from going to work, but it was without effect, and before night it became evident that the strike was a failure. Furthermore, the leaders began to realize that in offending against the fair managers they were antagonizing the United States Government, and the people of the United States as well; that the work upon which they had been engaged was a matter of national concern, and that it would be no slight thing to assume the responsibility of preventing its completion. It was realized that the unions would, by delaying the fair buildings, create more enmity than could be overcome by ten years of legitimate proceeding. Haste was made to confer with the fair managers and to withdraw the demands that had been made and on Tuesday morning the whole force went to work as usual, as if nothing had happened.

The real motive of this strike was to compel the Government to "recognize" the trades-unions, and the real significance of its failure is the firm opposing stand taken by the agents of the Government. By this incident the line is definitely drawn on the part of the Government against the proposition to concede to private organizations the power to make the industrial laws of the country. The impudent demand of the unions that the Government of the United States shall, in the employment of labor, discriminate in favor of one class of its citizens as against another class—and this is just what the protest against non-union workmen at Chicago meant—has been answered by flat denial. The sound ground has been taken that to make such concession would be a shameful surrender of responsibilities which the Government owes to its citizens. The Government owes to every man protection in his right to labor upon such terms as he may choose to make, and the action of the authorities at Chicago was in line with this just principle. To have accepted the terms proposed by the unions would, practically, have been abdication of a duty as sacred as any in the whole range of governmental responsibility.

The arrogant assumption of the unions of the right to fix the conditions upon which men may or may not labor would, if allowed, establish the enactments of the unions as superior to the enactments of Congress itself; and it would be a form of tyranny as oppressive and infamous as any which ruled in the dark ages of universal despotism.

Application of these principles to local and personal affairs will assist in their just comprehension. Is there a farmer in California who would not resent an authoritative dictation on the part of his hired men as to whom he should or should not employ? Is there a farmer who would tolerate the interference of a committee of farm hands who sought to make him discharge a man who was

willing to work upon agreed terms, and whose work was satisfactory? Is there a farmer or fruit-grower who would not feel that he was badly used if his help should quit work in the crisis of harvest-time because he employed other laborers who were not of their particular set? Is there a farmer who would allow a "walking delegate" to impudently "nose" about his fields, barns and dwelling for the purpose of hunting out and aggravating subjects of dispute between himself and his men? On the other hand, is there among the thousands of ambitious young men who, as "hands" on California farms, are laying the foundation for future independence, ones who would give over to a "committee" or a "walking delegate" the authority to regulate his conduct in all his relations to his employer? We hope not. The system of the trades-unions, which makes a few "leaders" impudent tyrants and makes the vast body of workmen scarcely better than slaves, finds little favor, we are glad to say, in the pure air of rural California. It is in the cities, and only in the cities where the beer hall and its associated dens have wrought degradation upon character, that men are found willing to surrender their self-control and self-respect and to become the mere puppets of professional agitators and bulldozers.

Suppose the Grange or the Alliance in California were to assume the right to dictate the terms of rural employment in this State; suppose they were to fix the rates for different classes of work and then demand that nobody but members of their Order should have the privilege of working at any price or upon any terms; suppose they were to appoint inspectors to go from farm to farm to see that their rules were exactly enforced, that no non-Grange or non-Alliance hands were employed; suppose they should take advantage of the busy planting or harvest time to order general strikes; suppose they should appeal to the Government to give them control of all rural labor with the power to legislate on all relations between employer and employed! What would the farmers of California say to such a series of demands? We will leave our readers to answer!

We do not deny, but, on the contrary, distinctly assert, the right of workmen to organize. This right to organize is, in fact, as sacred as the right to labor. What we do deny is the right of those who do organize to limit the rights of those who do not. If the workman at Chicago choose for any reason, singly or in a body, to quit work, they have (provided they have entered into no contract obligations) an undoubted right to do it; but they have no right to demand that others may not take up the work which they leave, upon such terms as they may choose to accept.

The legitimate purposes of organization on the part of workmen are many, and they include, among other things, the regulation of wages, the regulation of hours of labor, and the regulation of industrial discipline in all its forms. There can be no reasonable protest against concerted action to secure desired results, so long as no interference is made with those who may choose to go their own way. But when the organizers undertake, either by force or by any other means, to deny to the non-organizers the right to labor upon such terms as they may be willing to make, they are upon revolutionary and criminal ground.

We assert that the right to organize is as sacred as the right to labor—but not more sacred. The workman who should be required by the laws or under the political administration of his country (as the trades-unionists demand) to join some particular society and subject himself to the rules and discipline of that society before he should have the privilege of doing a day's work, would have the right to feel that his lines were cast in hard places; and it would not be surprising if he should ask what had become of American Liberty. The right of the non-union man—of the man who for good reason or for no reason prefers to make his own contracts disposing of his labor without consulting "committees" or "walking delegates"—is utterly ignored by the trades-unionists. That the rights of this man are just as sacred as their own they seem to overlook or disregard. But no Government based like our own upon liberty and equality can allow the rights of its humblest citizen to be overridden without sowing the seed of anarchy and revolution. It is bound to protect the non-union man in his right to labor just as it is bound to protect the union man in his right to organize. Thus in nearly every great strike we find the power of the Government arrayed in support of the non-unionists because it is the vice of the unionists to seek to over-ride the rights of others in the effort to promote what they conceive to be their own private interests. If Government were to decline or neglect to so protect its non-unionist citizens it would be partial, inefficient and infamous; and it would die, for no Government is worth maintaining, or would long be maintained, which would not or could not protect its humblest citizen in his primary rights. And among these primary rights there is none more natural or necessary than the right to labor.—*Pacific Rural Press.*

THE superior quality of ice sent from Truckee, Nevada county, Cal., is acknowledged all over the coast. Ten years ago the entire amount of ice shipped from this locality did not exceed 10,000 tons. But the superior quality of the ice of the region has gained such favor for it that the annual output now exceeds 160,000 tons. Several large firms within Nevada county have mammoth ice-houses. The Sierra Lakes Ice Company, whose gigantic houses located at Prosser Creek and Boca, on the Little Truckee river, are the largest in this world. At Prosser Creek they have four buildings for storing ice, each building being 450x50 feet, and at Boca they have three huge buildings used for the same purpose, two of them being 350x100 feet, the other 500x40 feet. The combined capacity of the different houses of this company aggregate nearly if not quite 80,000 tons, still the ever aggressive and progressive members of this company are going to greatly increase their storage capacity the coming season by the erection of additional buildings. Suffice it to say that they are the largest and most complete structures of

the kind in the world. All the fruit cars that are sent East from California are stopped at Truckee and re-iced. During the ice-harvesting season the Sierra Lakes Ice Company keep more than 500 men employed.

Smelting American Iron Ores.

In a lecture before the Franklin Institute, Mr. John Birkinhine of Philadelphia says:

To smelt iron ores a fuel and a flux are necessary, and in this country four fuels are employed; namely, anthracite coal, bituminous coal, coke made from bituminous coal, and charcoal. Coke is by far the most in demand for this purpose, and raw bituminous coal is used to but a limited extent, no record being now kept of the comparatively small portion of pig iron made with it exclusively. Including the output of furnaces using raw bituminous coal, alone or mixed with coke, with those employing coke alone for this purpose, we find that of all the pig iron produced in the United States, 70.6 per cent is smelted with coke and bituminous coal.

Coke is also liberally used with anthracite coal in varied proportions in the eastern part of the United States, 13.8 per cent of the pig iron being made with these mixed fuels, and but 3.7 per cent of our pig iron output being smelted with anthracite coal alone; the remainder, 6.9 per cent, is produced by the use of charcoal. At present the relative employment of the different fuels ranks in the following order:

Coke, sometimes mixed with raw bituminous coal.

Anthracite and coke mixed.

Charcoal.

Anthracite alone.

Raw bituminous coal.

Lime is the universal flux used, although different conditions require stone of varying composition, from nearly pure carbonate of lime to a mixture of the carbonates of lime and magnesia, known as dolomite.

The iron ores fed to blast furnaces are also of varying composition; the convenience of these furnaces, the yield of iron, the proportion of other ingredients which they carry, such as silica, lime, alumina, magnesia, phosphorus, sulphur, titanium, manganese, etc., and the expense of mining the ores influencing their use.

It is not within the province of this lecture to discuss the chemical composition of ores, but as the methods of producing different varieties, and the yield of these in iron, will necessarily demand attention, a brief summary of the classification adopted is offered.

The iron ores produced in the United States may be divided into four general classes, without particular reference to their geological occurrence, but approaching within narrow limits the practice generally followed in the sale and purchase of iron ores.

(1) *Red Hematite*, all the anhydrous oxides of iron known by various names, such as red hematite, blue hematite, specular, micaceous, fossil, slate iron, martite, flax seed ore, etc.

(2) *Brown Hematite*, including the varieties of hydrated sesquioxide of iron, variously known as limonite, goethite, turgite, hog ore, pipe ore, pond ore, grape ore, and also some manganeseiferous iron ore, and most of the iron ores mined in the Rocky mountain region for the smelting of argentiferous ores.

(3) *Magnetite*, those ores in which the iron is found chiefly as magnetic oxide; this class also includes some martite mined with the magnetite.

(4) *Carbonates*, those ores which contain a considerable amount of carbonic acid, such as spathic ore, siderite, black band, clay ironstone, etc.

Compressed Air Power for a Mine.

At the Chapin mine at Iron Mountain, Mich., the ore is taken from four shafts, ranging from 300 to over 600 feet in depth, and from an open pit of over an acre in area. The fourth shaft was sunk through a stratum of quicksand, and, in order to pass this, a circle of iron pipes was driven and connected with a refrigerating machine. This reduced the temperature of the contents of the pipe to about zero, freezing the quicksand, and, keeping it frozen, this was then drilled and blasted like rock. The machinery of the mine is run chiefly by means of compressed air, although there is ample boiler capacity to operate the entire plant in case of accident to the compressor plant. This compressed air is carried a distance of three miles in wrought-iron pipe 24 inches in diameter. The Quinnesec falls furnish, under a head of about 52 feet, the water to three 48-inch and one 54-inch turbine. There are three pairs of 32-inch diameter and 60-inch stroke, and one pair of 36-inch diameter and 60 inch stroke compressors. This compressed air is the motive power for the hoisting plant and also for more than 100 power drills. The number of employes varies from 1800 to nearly 2000. The ore is found in four large lenses, and is broken down by means of power drills and high explosives, loaded on mine cars, taken to the shafts, hoisted to the surface, where a cable conveys it to the trestle, on which the cars are automatically dumped into railroad cars or taken to the stock pile, from which the ore is afterward loaded on railroad cars by means of a steam shovel. By this means a 20-ton car has been loaded in four minutes. As much as 2700 tons of ore have been hoisted from one shaft in 24 hours, and in one year over 700,000 tons were mined.

It begins to look as if Oakland will have a new water-works system, and that the old Contra Costa Water Co. will no longer have a monopoly. The plan outlined in the Mayor's message, which is now under consideration by the Council, is to enter into a contract with some one of the new companies to deliver the water at the charter line, whence it will be distributed in pipes laid and owned by the city. Among the propositions are those of W. J.

Dingee to furnish from the artesian wells of Alvarado 4,000,000 gallons per day at \$200,000 a year, and one from W. B. Farwell of a company owning wells at the same place to furnish 6,000,000 gallons per day at the same price per year. Both offers are at a figure considerably less than is now being paid to the Contra Costa Company. The Blue Lakes Company will also make a proposition, and it is said that a movement has lately been started to organize a company for digging wells in West Oakland with the ultimate object of making a bid to supply the city. People who have pipe to sell will be glad to see any of these projects take definite shape.

Earth-Blasting for Tree-Planting.

The use of explosives for loosening hardpan before planting trees or vines is not new in California; in fact, the value of the practice under certain conditions is well established. We have often published descriptions of the practice as followed in this State. The following article on the subject, by Elmer Stearns, in the *Irrigation Age* of Utah, reviews the subject in an interesting manner:

All trees send their roots after moisture, as we often see by examining a tree on the bank of a stream, where the roots will be seen running down to the water or to the moist land at the water's edge. Some trees will send roots upward of 100 feet to get moisture. We can thus see that, to give the tree a sufficient amount of moisture, we must use artificial means where there is not a water supply for the roots to reach.

By loosening the ground to a depth of eight or ten feet, this result has been obtained and a most wonderful growth has been made. This can be done by the use of dynamite. We have records where trees thus treated have made a growth of three and four times that of trees not treated. The dynamite will loosen the ground to a depth of eight or ten feet, thereby holding the moisture for a much longer period and loosening the soil so the roots will have a mellow soil to push through and get the material in the soil necessary for their growth. Nearly all the soil in the arid region forms a sort of hardpan in the dry season; this pan is so broken up by the dynamite as to offer no resistance to the tree-roots in their lateral growth.

In such trees as apples, almonds, pears, walnuts, pecans and olives a gain of two to five years in growth has been obtained in this manner, and the bearing of the trees made correspondingly earlier. So, thus it is possible to get trees that formerly did not bear for six and eight years to bear in four or five. The use of dynamite has passed the experimental period and is now used almost universally in some localities, with the best of results.

Dynamite can be handled with perfect safety, and the total expense to prepare an acre of ground for trees in this way is very small, in fact, not as much as it is in planting where the ground is otherwise pulverized. The kind to use is the 30 per cent grade, which is considered strong enough for nearly all land. Use one-half pound for each charge, unless your land be rocky, then use from one-half to two sticks for a charge.

In preparing the charge, take a fuse six feet long and on one end attach a fulminating cap. First make a hole in the end of the stick of dynamite with some small stick, or a pencil will do. In this hole place the cap, and with a string, tie the fuse and cap firmly to the dynamite stick to hold the cap and fuse in place.

To prepare the ground for the charge, take a crowbar or two-inch augur with a seven-foot shank and make a hole in the ground six feet deep. Then place the dynamite stick with the fuse and cap attached in the bottom of the hole, and pour dry sand in the hole until full. If no sand can be had, any soil will do if tamped quite hard with a wooden stick. The charge will loosen the ground some distance below the bottom of the hole, and for many feet on all sides of the hole. There is little or no danger from the explosion, as the ground only heaves a little bit and no soil or rocks are thrown up. The ground will tremble for 15 or 20 feet away.

After the dynamite has exploded, take a shovel and dig a hole two feet square and of the same depth, filling in the excavation with surface mold and some fertilizer that will aid the tree growth and assist in holding the moisture about the roots. The water from the ditch will go as far down as the dynamite has loosened the soil, and will be retained there until it is used by the tree roots or evaporates. The evaporation can be held in check by a thorough and frequent pulverizing of the surface soil.

As the tree roots go down in this loose soil, they will always find sufficient moisture to make a vigorous growth, and the ground will not check their lateral and downward growth. Thus, in one season roots will make a growth of three times what they would in hard soil, where the water could not penetrate on account of hardpan or the dry, baked soil of the dry seasons.

The roots thus grown make it impossible for the wind to blow the trees down or out. The tap root will often go down several feet the first season. We have seen limbs on some trees make a growth of several feet in one season and it is just as possible for the root to make a similar growth if the conditions for its growth are same as the limbs. By having the soil loosened for a depth of eight or ten feet this growth can be made and at the same time a greater growth of limb made, as the limb growth depends wholly upon the root growth.

Those who have used the dynamite method of preparing the ground for trees say that the expense will not exceed 20 cents per tree and many have done the work at a cost of less than 15 cents per tree for dynamite. Where large tracts of ten or twenty acres are prepared it will reduce the cost even below the figures given, so the plan is within the reach of every fruit grower.

The direct results outside of getting a greater growth in trees and an earlier period in bearing are: The fruit is of a better quality, more even in size and a larger yield per tree. This is easily accounted for by studying the philoso-

phy of the loosened soil and water supply. The soil, being made porous, retains the moisture, which is given to the tree only as fast as needed, while by too much water coming in contact with the roots, as it does by surface irrigation the fruit grows more even and with such regularity that the flesh becomes more firm and the fruit will stand longer shipping and also keep longer. These are very important items with the fruit grower of the arid region who wants to have his fruit sold in the Eastern markets.

The Geological Training of a Prospector.

Arthur Lakes, of the State School of Mines, Golden, Col., contributes to the *Colliery Engineer* an article on this subject, from which we take the following:

One of the first things for a prospector of gold and silver to acquaint himself with is the elements of geology. He can read this up theoretically in many excellent treatises and manuals, such as LeConte, Dana and Shaler's *Manuals* and Geikie's *Hand-Book of Field Geology*, etc., and become learned in the names of eras and epochs and the jargon of scientific names of fossils and minerals and varieties of rocks; but let him not imagine at the end of this process that he "knows geology."

Geology can be no more learned by means of a book, without field work and the actual personal contact with nature and rocks, than chemistry or assaying can be acquired without ever using a test tube or a cupel. The student may, perhaps, be unfavorably situated for this practical field work. There may be no mountains or upheavals of strata or deep, natural ravines within available distance to study. He is located, perhaps, on the great, monotonous, flat prairie. Very well, then let him study what lies nearest him. This same flat, monotonous prairie has an interesting and wonderful history. Let him read up what he can find about this in his books, then go out and examine what he can of the few feet of horizontal strata exposed in some shallow water-course or dry ravine; examine minutely, both with eyes and microscope, the minerals composing this strata. Let him classify and collect and note the different kinds of pebbles scattered over the surface or in the bed of a brook. Let him speculate as to the cause of the undulations of the surface, the deposition and peculiar character of the clays forming the soil. Let him study thoroughly the geology of his native village, his immediate surroundings, first. The knowledge and practical habit of observation so acquired will lead later to more extensive studies in wider fields. A student may be shut up in a big city; let him study the paving stones of the streets and visit the stone-yards of the masons. It will pay him better to take a trip to some distant mountain region than to buy another expensive book on geology after he has mastered the first bare elements. Nothing like field work, eye practice and hammer practice. The student should endeavor, whenever he possibly can, to verify by actual vision and personal experience whatever he reads in his books. When traveling, let him always carry a geological hammer with him, and at any station the train may stop for a few moments "step out" and try to get a specimen of the country rock; at the same time let him study all he can of the geology of the country he is passing through from the windows of the train, aided perhaps by a geological map. The genuine prospector is always looking about him, is everlastingly cracking stones, has always his eye wide open for "something kind o' curious."

If near some mountain region, where, as in Colorado, the whole strata of the earth's crust is upheaved and exposed along the mountain flanks, in the depths of the canyons or on the summit of the peaks, after studying his manual let the student get, if he can, some published geological report on such a country, such as those of the U. S. Geological Survey, abounding in illustrations and geological sections. Let him take this book in hand and go to the very place described and pictured as a geological section, and with his hammer study each member of the section closely. This will make him familiar with the different geological periods, formations, rocks, minerals and fossils as they actually appear in nature rather than as his imagination has supposed them to be from his study of the text-books; book geology and field geology are not always in perfect harmony.

Having studied and learned one local section well, such as that cut by a stream along the foothills of a mountain range, let him repeat the course at the other and more distant points. He will find at each locality, though the main features are the same, there is always an interesting variety, such as new fossils, peculiar minerals, changes of dip, faults, or other structural peculiarities.

Along the flanks of a mountain range, a prospective prospector cannot study too many of these geological sections. Having become familiar with these foothill sections, he is prepared to plunge into the heart of the range itself. At first, and for long distances, perhaps, he will encounter only granitic rocks forming the axis and core of the range. These are well worthy of study and full of variety. Later, the canyon may open into some mountain valley or park, where the strata he studied on the foothills or prairie border are again repeated, and he finds himself again at home. Seizing upon some well-defined and familiar representative of a geological horizon, from this as a standpoint he soon reads off the succession of the rest. Here, however, the appearance and texture of the rocks will probably be different to what they were in the foothills. Heat has so changed or metamorphosed the sandstones and shales, that they are scarcely recognizable as the same rocks as those of the foothills. Yet even here a highly silicified fossil shell or a leaf impression on shales, or sandstones changed into slates or quartzite, will give the prospector his clue and his desired and definite geological horizon, and he will have little difficulty in again arranging and grouping correctly the rocky series. But a prospector has a "practical end" in view; he is "after the precious metal" gold and silver, not after "pure science" or "fossils or sich." What practical use is there, he may ask, in this same careful study of geo-

logical sections, where probably there is not a speck of gold or silver? Simply that minerals and metals of economic value, such as gold and silver, are more frequently found in the rocks of certain geological periods than in others; locally this is especially true. For instance, nearly all the silver-lead deposits of Colorado are found in a certain bed of limestone not over 200 feet thick, to be found only in one geological period out of many others; viz., the lower division of the carboniferous. It would naturally, then, be advisable for a Colorado prospector to be able surely to identify this limestone as well as the geological horizon in which it occurs among the various other limestones of various other periods and ages in the mountains.

Again, gold is mainly confined to crystalline rocks of Archæan age, or to porphyries associated with these. A prospector should be familiar with these rocks and their varieties. Gold is also found in the placers derived largely from the breaking up of these rocks; the ability to distinguish the different pebbles may lead to the source whence the gold was derived. Familiarity with rocks of all kinds is a necessary prospector's education in itself.

The Future of the Horse.

When the agricultural world was invaded by labor-saving machinery, very much of which was operated by the labor of horses or cattle, the cry arose that men were to be crowded out of employment. The same cry was raised in a multitude of manufacturing industries whose operatives declaimed against each new appearance of machinery perfected in the line of economy of human labor. But results have proved the groundlessness of such fears. The introduction of improved machinery simply enlarged production, enabling it to keep pace with a rapidly increasing demand, while men's labors were found to be as much in demand as before, but under somewhat different conditions. In like manner, when a few years ago the possibilities of electricity began to become apparent, and the equipment of horse-car lines with this new motive power was seen to be a coming event, the cry was raised that the breeding of horses was to receive a serious check. Later came the safety bicycle, and thousands, who before depended upon horses for locomotion, sold their teams and took to the less expensive silent steed. Here, then, was another evidence of the passing of the horse. Just how far these fears are likely to be realized cannot yet be fully known, for the application of electricity as a motive power has not yet become at all universal, nor has the bicycle attained the full measure of its popularity, distinctly and widely popular as it has already become; but this much is certain, the time is not far distant when tens of thousands of horses that now draw tram and street cars will be replaced by the trolley or storage battery system.

In the continuous discovery of electrical possibilities, it is impossible now to say whether electricity may not replace horses in other lines of work, such as teaming between points joined by electric railroads, on some of which even now freight, as well as passenger cars, are being run, the freight service being employed in the night when the track is clear. All these signs point to a gradual encroachment upon the work of light and heavy draft horses by the electric current, whose wonderful powers are being so rapidly demonstrated. One need not be an alarmist to foresee a lessened demand for work horses from that demand that would undeniably have existed had electricity not entered this field.

Draft horses will always be needed, but it is the part of wisdom to bear in mind a very possible curtailment of their usefulness, and, therefore, their value in the future. The wise man lays his plans for possible contingencies. If he breeds horses of a particular grade, and thinks he sees a lessening demand for his product in the future, he will straightway get himself in readiness to meet changed conditions. Will he give up breeding horses? Not necessarily. He will simply find out what class of horses is likely to be in demand—electricity or no electricity—and will endeavor to meet the requirements of a changing market.

The person who looks carefully into the conditions that exist in society at the present time cannot fail to be impressed with the rapid accumulation of wealth on every hand, and the tendency to get as much comfort and pleasure out of it as possible. One marked result of this is an enormously increased demand for stylish and high-spirited driving horses, matched pairs and fast roadsters. The noted horse-breeding portions of the country are being constantly searched by the agents of wealthy men looking for horses that meet these conditions, and when they find what they want, the matter of price rarely stands in the way of a purchase. Nothing of an economic or industrial nature comes into this demand, and changing conditions of life are not at all likely to affect it.

There are many sections of our country excellently adapted to the raising of first-class horses, which have as yet not been developed. A substantial beginning in this direction need not necessarily involve the investment of a large amount of capital. The main outlay would be for a pure-bred sire of a strain desired to perpetuate. From this starting point, the character of the stud should be constantly improved by the infusion of better blood. I have never been an advocate of an attempt on the part of the average farmer to raise fast horses, nor do I now advocate it; but I think the time has come to look the matter squarely in the face. If farmers are to continue to breed horses, it is the part of wisdom to let such breeding run in lines where there is the greatest demand and the most money. The secret, or at least one of the secrets, of successful farming is to find out what the public wants and then to furnish the very best quality of the article desired. If the public wants a particular kind of horse and is willing to pay liberally for good specimens of that type, and if farmers are to continue to breed horses, then it is certainly wise to supply the demand.—Webb Donnell in *American Agriculturist*.

A Timely Publication.

HAUPT'S STREET RAILWAY MOTORS. JUST READY.

STREET RAILWAY MOTORS, with Descriptions and Cost of Plants and Operation of the Various Systems in Use or Proposed for Motive Power on Street Railways. By HANSMAN HAUPT, C. E., Chief of Bureau of Military Railroads during the late war; Late Chief Engineer Pennsylvania R. R.; General Manager Northern Pacific R. R.; Pie mont Air Line; Chief Engineer Tide Water Pipe Line.

In One Volume, 12mo., 313 pages, price \$1.75. By mail, free of postage to any address in the world.

EXTRACT FROM THE PREFACE:

"The present age seems to be peculiarly prolific in the invention of motors for street railways and in new applications of old and recognized motor forces for propulsion of the cars used for urban and suburban transit. Some of these possess decided merits, and present claims for the support of capitalists and of the public that are, at least, worthy of careful examination; others are advanced by parties who are evidently ignorant of the thermodynamic, chemical and mechanical laws upon which some of these operations depend, and schemes are sometimes presented that are visionary and impracticable. A brief review of the plans proposed for street railways, their merits and defects, with the cost of plant and of operation, will probably possess sufficient interest at the present time to excuse the preparation and publication of this volume. The aim of the writer has not been to furnish an elaborate treatise requiring for its comprehension a high degree of technical knowledge, but rather a simple statement of principles and their applications that will be readily comprehended by persons of limited scientific attainments—a treatise for the use and information of investors and of the public."

ABSTRACT OF CONTENTS.—I, Horse Railways; II, Steam Motors; III, Ammonia Motor; IV, The Hot-Water Motor; V, Gas Motors; VI, The Pneumatic or Compressed-Air Motor; VII, Tests of the Hardie Compressed-Air Motor; VIII, Economical Modes of Compression; IX, Cost of Operation of the Compressed Air Motor for One Day; X, Other Air Motors; XI, Cable and Electric Roads; XII, Electric Lines; XIII, Low-Pressure Air Motors; XIV, Storage Batteries; XV, Cost of Carbonic Acid as a Motive Power; XVI, Transmission of Power by Means of Pipes; XVII, General Summary; Appendix; Index.

The above or any of our Books sent by mail, free of postage, at the publication price, to any address in the world.

A circular showing the full table of contents of the above book sent free to any one who will apply.

Our New and Revised Descriptive Catalogue of Practical and Scientific Books, 88 pages, 8vo, and our other Catalogues, the whole covering every branch of Science applied to the Arts, sent free and free of postage to any one in any part of the world who will furnish his address.

Mechanical Progress.

A Modern Railroad Depot.

Marvels of modern railroad skill are, says the *Public Ledger*, given daily illustration upon the property of the Pennsylvania Railroad Company, at Broad Street station, where, beyond Fifteenth street, the work upon the spans of the mammoth new train shed is being pushed with great vigor. Two of these great stretches through the air between Market street are already in position and work upon the third has begun. These wrought-iron spans stretch across a space of 307 feet—inside measurement—and rise into the air with a graceful curve. They are outlined against the sky in perfect symmetry, and engineers who, among the thousands that daily pause and watch their building, pronounce them among the finest examples of span structures of their class. The skill and arrangement which allows the building of these spans, which will be the greatest of any that stretch over the network of tracks in the terminal stations of the trunk lines, without interfering with the running of a single train, is also a subject for consideration. The work is carried on uninterruptedly from morning until night, while the schedule of the Pennsylvania trains in and out of Broad Street station is operated without a moment's delay on account of the building. And yet above the tracks and the train shed the giant traveler, upon which the spans are building, rests and moves with the work. This traveler is the largest ever built for the purpose in the country, and is an enormous structure, into the building of which has entered thousands of feet of lumber and tons of iron in the shape of bolts and spikes. The traveler spans the entire distance between Market and Filbert streets, rising in a semi-circular form into the air until at the center it is 150 feet above the ground. The entire weight rests upon a number of four-wheel trucks, which in turn rest upon four sets of track, making the whole structure movable. Two of the track sets are built high above the main set, which are on a level with the regular elevated tracks in Broad Street station. The steam power for the manipulation of the traveler and for the moving of the wrought iron used in the construction of the shed is all located on the traveler. The material is brought in freight cars over the elevated road and unloaded at the point desired, which advantage greatly facilitates its prompt delivery. The trunnions of a number of the spans are already standing at the foundations upon which they are to rise, and the entire mechanical and engineering forces of the contractors are pushing the work as fast as possible. The new track system is almost completed up to the point of the Seventeenth street tower, and, when the spans are all thrown across the space between Market and Filbert streets, the completion of the track-laying will be accomplished very soon. Now that the entire business of the Adams Express Company, formerly at Sixteenth and Market streets, has been removed to the new building at Seventeenth street, the old offices have been abandoned, and the work of demolishing them, expected for some time, has begun. Long before the work on the train shed reaches Sixteenth street the old Adams Express buildings will be torn down for the foundations of the elevated tracks on their site, as the extension across Sixteenth street will have to be finished. The Filbert street side of Broad Street station, above Fifteenth street, is being gradually torn away as the building of the spans moves westward. The improvements beyond the Seventeenth street tower are fully as important as the work to the eastward, which attracts the attention of thousands daily. The new tracks are being laid as fast as possible, and the work of closing Filbert street, beyond Twenty-first westward to the Schuylkill, is moving rapidly. It will not be long before the widening of Filbert street bridge will begin, as when the train shed has reached an early stage of its completion the track system on the elevated will have been enlarged and extended as provided for in the plans.

How to Rig the Indicator.

In using the steam-engine indicator, select some reducing motion with as few joints, and as little complication of parts as possible. In a number of works on indicator practice which I have examined, the manipulation of the instrument and the working of the engine as shown by the diagram is placed before the reader with much minuteness. The reducing of the stroke of the piston to that of the desired length of the diagram seems to me to be somewhat slighted, or passed over with less attention than this subject war-

rants. A chance for error and much annoyance is experienced by unskillful or careless handling of a reducing rig.

The principal use of the indicator for the working engineer is to guide him in the adjustment or setting of his valve gear. The instrument should be applied at least once a week, and some rig for reducing the motion of the piston should be selected which will admit of easy adjustment without stopping the engine. In visiting engine-rooms in my locality I have seen several different rigs which are approximately correct, and of sufficient merit to warrant a reproduction of some sketches descriptive of them.

A neat arrangement consists of a light brass wheel which has two diameters, the larger diameter being of such dimensions that the circumference will be one-half the stroke of the engine, and the smaller having a circumference one-half the length of the diagram. A cord wound two or three times around the large wheel is attached to the cross-head, and a cord from the wheel of smaller diameter leads to the barrel of the indicator when in operation, or is hooked to an idler cord which passes over a leading pulley to a weight while the indicator is at rest. A clock spring attached to the side of the wheel causes the return motion after the cord has been drawn out by the moving cross-head. This rig is a permanent attachment to the front head of an engine I have in mind, is in regular use, and is giving satisfaction. I fitted up one of these wheels at a total cost of three dollars.

If there are several feet of space between the walls of your engine and the engine-bed a rig may be fitted quickly and without cost. Procure a stick of half-inch hard wood an inch and a half wide, and from two to three times the length of the stroke of the engine. To one end of the stick fix a slotted piece of iron, which is intended to be driven by a stud on the cross-head. On the other end of the stick attach a piece of iron with a hole drilled in it for a half-inch pin to work in. Make the pin fast in an angle-plate attached to the wall. The cord from the indicator barrel must lead at a right angle to the line of the cylinder, changing its direction by leading around a small pulley and to a peg placed at a proper distance on the wall end of the stick.—M. Cable, in *Power*.

Press vs. Steam Hammer.

There has been a tendency of recent years to substitute the hydraulic press for the steam hammer in very heavy work, and some presses of very large capacity have been erected. In the Krupp works a 5000-ton press was put in operation not long ago, and the Bachum works, also in Germany, started up a 4000-ton press last year. The Chatillon-Commentry forge in France has also a 4000-ton press, and the Vickers works at Sheffield in England are building the largest machine of the kind in existence, which will be capable of exerting a pressure of 6000 tons. In this country very little use has been made of the forging press, but it is announced that the Carnegie Co. in Pittsburgh has contracted with the Whitworth Co. for a press of great capacity which is to be used for the same kind of work on armor plate and gun forgings, which is done at Bethlehem by the great 125-ton hammer.

The relative efficiency of the hammer and the hydraulic press is a question which has been hotly discussed by experts. About four years ago some very interesting experiments were made at the Arhel forges at Rive-de-Gier in France which failed in their immediate object, which was to establish a definite ratio between the weight of a hammer and the power of a press required to do the same work, but which nevertheless shed some light on this subject. The general conclusion reached was that forgings made under the hammer showed a finer grain and a greater degree of uniformity in texture than those made with the press. It was noted that while hammer forgings showed a better surface, the press forgings had the greater density in the center. These experiments, while their general indications favored the steam hammer, were hardly carried far enough to be conclusive, but a more satisfactory determination may be expected from the work of the great machines referred to above. It is not at all probable, however, that the steam hammer will be superseded, and for many classes of forgings it will always be indispensable.—Engineering and Mining Journal.

CAR-COUPERS.—The law passed by the last Congress in its closing days, requiring all railways to adopt automatic car-couplers on all their cars, will entail a very large expenditure of money by the railways. Chauncey M. Depew, president of the New York Central, said recently that there were between 2,000,000 and 3,000,000 cars in this

country, and that the equipment of a single car with automatic couplers cost about \$20. The total expenditure of the roads for this single item, therefore, would be about \$50,000,000. Automatic couplers have, however, already been extensively adopted. A law similar to the National enactment on this subject was passed by the legislature of New York four years ago, the railways in the State being required to equip annually 20 per cent of their rolling stock with the automatic couplers. Mr. Depew said that the New York Central had complied with the provisions of this State law, and that before the National law became operative all the Central cars would have the automatic couplers. He thought the expense would bear rather hard on the smaller roads. He estimated that if any sole owner of a patent could get his coupler exclusively adopted by all the railways he would soon be the richest man in the world. However, there are some 20 patents, and no danger of a monopoly by one individual.—*Railway World*.

Scientific Progress.

Giant Eucalyptus Trees.

A recent article in *Science* repeats the old idea, which has been frequently refuted, that the *Sequoia gigantea*, or big tree of California, is the largest tree known. It has been shown many times that these trees are surpassed in both height and girth by the gum trees of Australasia. A large number of species is known, and many of them are mentioned in Baron von Mueller's "Extra Tropical Plants." An extract from this book will be of interest, as giving the dimensions of some of these immense trees. Of *Eucalyptus amygdalina*, it is said:

"In sheltered, spriggy, forest glens attaining exceptionally to a height of over 400 feet, there forming a smooth stem and broad leaves, producing also seedlings of a foliage different from the ordinary form of *E. amygdalina*, which occurs in more open country, and has small narrow leaves and a rough brownish bark. The former species or variety, which has been called *Eucalyptus regnans*, represents probably the loftiest tree on the globe. Mr. J. Rollo, of Yarragon, measured a tree which was 410 feet high. Another tree in the Cape Otway ranges was found to be 415 feet high and 15 feet in diameter where cut in felling, at a considerable height above the ground. Another tree measured 69 feet in circumference at the base of the stem; at 12 feet from the ground it had a diameter of 14 feet; at 78 feet a diameter of 9 feet; at 144 feet a diameter of 8 feet, and at 210 feet a diameter of 5 feet. Thus, at a height in the air exceeding the height of almost every North American forest tree, this specimen had a diameter equal to most of our largest forest trees at the ground. Other trees are known with a stem circumference of 66 feet at five feet from the ground. Prof. Wilson and Colonel Ellery obtained at Mount Sabine a measurement of 21 feet 8 inches in diameter of a stem where cut, the length being 380 feet. Col. Ellery had repeatedly reports of trees seven ax handles in diameter, and he met a tree on Mount Disappointment with a stem diameter of 33 feet at about four feet from the ground." Other species also attain enormous size. *Eucalyptus diversicolor* is known to grow 400 feet high, and trees have been measured 300 feet long without a branch! Boards 12 feet wide can frequently be obtained. *E. globulus* grows 300 feet high and furnishes ship keels 120 feet long. *E. obliqua* also attains 300 feet in height and 10 feet in diameter. A note in a recent number of *Garden and Forest* mentions a tree in Victoria 471 feet in height.

The colossal size of the trees of this genus is not the only peculiar feature they possess. Some are of exceedingly rapid growth, and are at the same time very durable. *Eucalyptus amygdalina*, for example, grew to a height of 50 feet in eight years in the south of France. *E. citriodora* grew 20 feet high in two years in a district subject to protracted drought, and a trunk 40 feet long and 20 inches in diameter only broke after a flexion of 17 inches, under a pressure of 49 tons. *E. corymbosa* is very durable, fence posts that had been in the ground for 40 years showing hardly any decay. *E. globulus* grew 60 feet high in eleven years in California, and in Florida 40 feet in four years, with a stem a foot in diameter. The writer has seen trees in California, two years after planting the seed, 20 feet high; and the wood, although easily cut when green, becomes almost as hard as iron when dry. In Guatemala it grew 120 feet in twelve years and had a stem diameter of 9 feet. Railway sleepers made of *E. leucoxylon* were quite sound after being laid 24 years. Piles driven for a whaling jetty in 1834 were taken

out in 1877 perfectly sound, although the water swarmed with teredo. This was *E. marginata*. Still more remarkable is the fact that some species withstand excessive heat and also a considerable cold. *E. microtheca*, for example, resists a temperature of 18° F. in France and 154° F. in central Australia. Besides serving as a timber tree, many species of eucalyptus are used medicinally, producing a volatile oil very useful in treating various infectious diseases, like scarlet fever, especially when applied externally. Grown in malarious districts, they possess the power of purifying the air. Altogether, the genus may be classed as one of the most remarkable in the whole world.—Joseph F. James, M. Sc., in *Science*.

Occupations and Length of Life.

"What occupation tends most to prolong life?" asked a reporter of the chief mathematician for one of the great life insurance companies.

"That is a difficult question," he replied. "I can only answer it by referring to the occupations of persons whose lives are and have been insured by us. Inasmuch as they number several hundreds of thousands, they will afford a pretty good basis from which to draw conclusions on the subject. According to this evidence, it appears that commercial travelers and agents live longer than men in any other kind of business, notwithstanding the hazards which attend transportation by rail and water. Next to them come dentists, teachers and professors, including music teachers."

"And who after them?"

"Next to them in point of longevity are hatters, clergymen and missionaries. The last may occasionally furnish food for the larder of untutored savages, but they are a first-rate risk nevertheless. Next come bankers and capitalists, who seem to live just a trifle longer than butchers and marketmen. Lawyers and jewelers follow, and they are succeeded on the list by merchants, peddlers, milkmen and pawnbrokers. Then come gardeners, laborers, civil engineers and canvassers. Perhaps the treatment which canvassers are apt to receive in ordinary course of their business shortens their lives."

"Where do newspaper men come?"

"O, they don't live as long as any people I have mentioned. Even bookkeepers and bank cashiers, as well as artists and architects, are ahead of them. They come in next, with the printers, physicians, and the gentlemen who are not engaged in any active employment. They follow the apothecaries and photographers, and after them, in order, bakers, cigarmakers, real estate agents, army officers and soldiers, liquor dealers, marines and naval officers. Shortest lived of all seem to be the auctioneers, boardinghouse keepers, barbers and drivers."

"Do you take into consideration the question of a customer's occupation in granting a policy?"

"Not unless it is more hazardous than any of those I have mentioned, though if I were in doubt about accepting the man at a risk for other reasons, such a point might turn the scale."—*Washington Star*.

EXTINCT LAKES IN GREAT BASIN.—In an article in *Natural Science* occurs the following paragraph: Turning now to the second region of extinct lakes to which we have alluded, we find in the Great Basin of North America a district of which the geology has been worked out quite recently by the Geological Survey of the United States. It would be impossible in a few words to do justice to the valuable monographs by Messrs. G. K. Gilbert and I. C. Russell, but their main conclusions are these: An enormous area in Nevada, Utah, Oregon and California forms an enclosed basin, now occupied by deserts and by salt lakes with no outlet toward the sea. The basin seems to have originated in late Tertiary times, through irregular earth movements which raised certain tracts and depressed others. The region was apparently altogether above the sea level when the formation of the basin took place, or at any rate was saved from the influx of the sea by higher land. We find, therefore, no evidence that the sea ever penetrated into the region after it became a basin, and there is no evidence of the former existence within it of a marine fauna. Though the sea never penetrated into the Great Basin, there was formerly a much heavier rainfall; so that instead of the existing deserts and salt lakes there were large sheets of fresh water, comparable in size with the Great Lakes on the other side of the continent, and, like them, overflowing toward the sea. It is a most interesting region to the geologist, for the Great Basin well illustrates the formation of lakes through irregular earth movements.

CAPACITY, 12 Tons in 24 Hours. 3 H. P.

MARSHUTZ & CANTRELL, Sole Manufacturers.

The Patentee and Manufacture
cordially invite miners to critically
examine and pass judgment upon
this improved system of milling
and amalgamating ores in the fol-
lowing particulars:

1. The cost is less than one-half of
stamps of same capacity.
2. The freight to mine is less than
one-half of stamps.
3. The cost of erecting is less than
one-fourth of stamps.
4. The power to drive it is less than
one-half of stamps.
5. The wear is less than one-quar-
ter of stamps.
6. There is no wear except on
shoes and dies.
7. In point of amalgamation it is
superior to any other machine
in use.
8. In its simplicity of construction.

We challenge competition with
Stamps, Ball Pulverizers or and
other ore crushing machines now
before the public.

Send for Circulars and Price List.

MARSHUTZ & CANTRELL.

THE BLASDEL CONCENTRATING BELT COMPANY.

We are now having our new Improved
Concentrating Belt manufactured in San
Francisco. We keep always on hand
Belts suitable for the Triumph and Frue
machines, but can make any length or
width desired. The advantages of these belts over
any others will be readily seen by practical millmen.

First, the flanges or edges of our belt stand at an acute
angle inclining toward the center, and therefore readily
conform to the change of direction while passing over
the end rollers; thus the vexation and loss caused by the
frequent breaking of the flanges of the old style belt is
practically done away with. Again, our belts, at intervals
of two to four feet, have a very slight rifled surface for the
space of three inches, which tends to equalize the pulp
on the belt, and prevent it from hanging on the sides and
forming channels through the center. These slight rifles
also save very fine pulp and the quicksilver that
would otherwise escape with the tailings from a belt,
the surface of which is entirely smooth. We can safely
say that it is a better concentrator belt than has ever
been manufactured. It will last much longer and
will handle more pulp. We also manufacture smooth belts with same flanges when desired.

H. G. BLASDEL, Jr., Manager. 419 California St., San Francisco.

Electricity.

Gray's Telautograph.

If expert electricians are not wofully mistaken, says *Iron Age*, another very important aid to the facilitation of business has been perfected. Prof. Elisha Gray, of Highland Park, Ill., after six years of constant experiments, last week exhibited his apparatus for transmitting by wire a *facsimile* of anything written or drawn, the apparatus being of such a simple character that a skilled operator is not necessary. It is claimed that every obstacle which has hitherto defeated the attainment of this long-sought process has been surmounted, and that the apparatus is ready for introduction into practical everyday use. It is styled the telautograph. A transmitter and a receiver are used, each somewhat smaller than a type-writing machine. The transmitter and receiver stand side by side. In sending a message, an ordinary lead pencil is used, near the point of which two silk cords are fastened at right angles to each other. These cords connect with the instrument, and, following the motion of the pencil, regulate the current impulses which control the receiving pen at a distant station. Ordinary paper five inches wide, arranged on a roll attached to the machine, is used by the writer. The receiving pen is a capillary glass tube placed at the junction of two aluminum arms. This glass pen is supplied with ink, which flows from a reservoir through a small rubber tube placed in one of the arms. The electrical impulses coming over the wire move the pen of the receiver simultaneously with the movements of the pencil in the hand of the sender. As the pen passes over the paper, an ink tracing is left, which is always a *facsimile* of the sender's motion, whether in the formation of letters, words, figures, signs or sketches. Apparently, the only limit in reproduction is that of stenographic characters, as the machine makes but little distinction between heavy and light lines.

Assuming that the telautograph is now in as good condition for practical use as was the telephone when first brought out, a magnificent range of possibilities is presented. Private wires for the transmission of messages can be furnished business offices as easily as telephonic communication is now established. A business man can receive and transmit his own messages without the intervention of a messenger boy and also without having them pass under the scrutiny of two or more telegraph operators. Further, not only does he secure secrecy, but he also obtains a record in black and white of his telegraphic correspondence, including exact reproductions of the communications sent by the party at the other end of the wire. The telegraph and telephone may not be superseded, as they have their uses; but the telautograph steps in to occupy a field which neither of them can cover. As the receiver works without any attention, persons having telautograph connections can be furnished with dispatches or messages at any time, day or night, which will be appreciated by those who occupy their offices irregularly.

The *facsimile* of the original writing of a message, which is provided by the telautograph, will avoid many disputes and mistakes arising in the transmission of communications by our present system. Even the identity of the writer or sender is thus preserved, and can be traced by those familiar with his penmanship. Contracts in much more satisfactory form can be made in this way than by telegraphic message or telephone, and it may not be necessary to add, as now, "Please confirm by mail."

ELECTRIC BOAT.—It is expected that a new high-speed electric boat will be exhibited at the annual Fourth of July regatta on the Schuylkill river, at Philadelphia, this year. The Cup and People's Regatta Committee for 1893 has organized with Dr. Conrad Berens as chairman, and his proposition is to rig up an eight-oared shell with a propeller to be driven by electricity. The weight of an eight-oared crew and fixtures is about 1000 pounds, and the electric apparatus and gearing can even exceed that weight a little, since it will be mostly below, instead, as with a crew, mostly all above the washboard. The American Electro-Dynamo Company, of Philadelphia, has secured the contract to make the experiment on an Undine Club eight-oared shell, and the work will be pushed forward at once. The body of the shell will be used entirely for the storage cells and motor, and the one occupant of the boat, who will sit in the coxswain's seat, will be captain, engineer, helmsman and referee of the race. The propeller will be fitted under the shell and will probably be located just back of the coxswain's seat. It is believed that such a

craft will be capable of even greater speed than the Yankee Doodle showed, and will, in addition, be free from all objectionable features which larger boats have on a rowing race course. There will be practically no suction influence such as large boats have over racing shells, and the referee can actually mix with the contesting crews, should occasion require, without interfering with them.—*Electrical Review*.

Electrical Congresses.

It must be admitted, says *Electricity* of London, in speaking of the coming World's Electrical Congress, that no better place and no fitter occasion could have been chosen for such a gathering than will be presented by Chicago during the time of the exhibition. It will be of interest to note that all previous international electrical congresses have been held in connection with universal or electrical exhibitions, and this is, no doubt, due to a desire on the part of the organizers of the congress to afford to the members practical illustrations on the largest possible scale of the science of applied electricity, which could hardly be said to have existed 20 years ago. The Paris Electrical Exhibition of 1881 came as a surprise even upon the most prominent electricians of the time; very few among them knew what a dynamo, an arc or glow lamp or a telephone meant, and a fortnight spent in Paris taught them more than the protracted study of years. The achievements of this exhibition were of a two-fold character. In the first instance, it demonstrated the practicability of electric lighting; and, secondly, it placed applied electricity on a thoroughly scientific basis, by supplying it with units of measurements, such as the volt, the ohm, the ampere and the farad.

Subsequent exhibitions and congresses cannot boast of such remarkable achievements, although they all contributed their share toward popularizing the new electrical appliances and spreading electric knowledge. They each introduced some typical and marked improvements to public notice. The Paris Exhibition of 1881 gave us electric light, the Munich Exhibition of 1882 produced the first experiments on a large scale of distinct power transmission, the Vienna Exhibition of 1883 showed us the first shunt and compound wound dynamos, and the Frankfurt Exhibition of 1881 brought us the practical realization of one of the greatest projects ever conceived—electrical power transmission over a distance of more than 100 miles. The two last electric congresses, however—the one in Paris, in connection with the exhibition of 1889, and that in Frankfurt in 1891—produced very little result. The program of the former congress was one of the most elaborate and most ambitious documents we have ever seen in print, and when the congress was over it was found that not one-twentieth part of the topics proposed for discussion had ever been approached. If the congress, instead of lasting for 10 days, had been prolonged for 10 weeks, they could not have gone through half the program. The Frankfurt congress was simply made the occasion for the reading of some highly interesting papers, but in its results was as fruitless as the Paris one of 1889. The program of the Chicago congress now before us is certainly most promising, and holds out hopes of vast improvement in the nomenclature and definition of electrical units and terms, but we are afraid it is too large a program, and that a week is not nearly sufficient to arrive at a practical result.

NIGHT SIGNALS.—Mr. Badeo-Powell, of the Scots Guards, has devised an ingenious method of signaling by night with the aid of a paper fire-balloon of six or eight feet diameter. When it is desired to send a message, some heads made of a brilliant, quick-burning composition are strung on a piece of quick-match, leaving intervals, and using large and small beads to make the corresponding flashes. The balloon is inflated by burning spirit, or even straw or wood. The message string is then suspended below it, a time fuse attached, and the balloon being sent up, the message is flashed forth. The apparatus is described as very portable; one man can easily carry it, and with it not only can one preconcerted message be flashed, but a few words can be sent up at one time, and those can be answered from a similar balloon from another part, upon which other balloons can be employed to continue the signaling.

GRANITE is the lowest rock in the earth's crust; it is the bed rock of the world. It shows no evidence of animal or vegetable life. It is from two to ten times as thick as the united thickness of all other rocks. It is the parent rock from which all other rocks have been directly or indirectly derived.

Useful Information.

Facts Not Generally Known About Woods.

There seems to be an unfounded but very general prejudice against one of the most durable woods grown in America. The word pine is, in the general mind, associated with that kind of pine used for inside building and finish, the white pine of the North. Such expressions as "soft as pine" or as "brittle as pine" are very common, but applicable to only a few species of the great pine family. Mr. Chas. S. Sargent, of Brookline, Mass., professor of arboriculture in Harvard College, was commissioned by Census Superintendent Walker to collect information respecting the forest trees of North America. Exhaustive attention was given by Professor Sargent to ascertaining the various qualities and behaviors of the principal woods used in manufacturing, testing them under various kinds of strains. This was not done by guesswork, but with apparatus capable of recording exact results. The testing apparatus used is located at the Watertown arsenal, and cost the Government over \$150,000. With this apparatus, specimens of wood, thoroughly seasoned, from various parts of different trees, were tested and results noted and published for the use and benefit of the public.

Looking over the tables, it is found that the Long Leaf Yellow Georgia pine is the peer of any wood for general purposes, and particularly in the manufacture of machinery subject to great transverse strain, and but for the fact that the public have unthinkingly come to refer every wood of the name of pine to that species which has the least resisting power of all the great pine family, ash and oak would long since have been discarded. We find that in 22 tests of the best American white ash, the highest breaking strain was 1210 pounds; the lowest, 389 pounds. Average breaking point of the 22 pieces, 720 pounds. In 27 pieces of the Georgia Long Leaf pine, the greatest strain withstood by any piece was 1381 and the least 770 pounds; the average breaking point being 1078 pounds, as against 720 pounds for the best American white ash. All of the pieces tested were of the same size and shape.

Comment seems unnecessary. There will hardly be a single reader of this article who cannot recall instances in his own experience when he wished the particular piece of pine he had to deal with was not so hard to break.

We quote from the report of the chief of the Division of Forestry, U. S. Department of Agriculture, for 1891: "The long-leaf pine is superior wherever strength and durability are required. In tensile strength it approaches and may surpass cast iron. In cross-breaking strength it rivals the oaks, requiring 10,000 pounds per square inch to break it, while in stiffness it is superior to the oak by from 50 to 100 per cent."

"Contrary to common belief, the tapping for turpentine was found by a large number of tests, lately made under direction of this division, not to weaken, but to strengthen, the timber in cross-breaking, and to increase its stiffness."

Just now the question of the use of the Long Leaf Georgia pine is of considerable interest to many of our readers, and to Texas dealers in agricultural implements, whether the pine used by manufacturers is an inferior wood.

The above conclusions, based on careful investigation, show that the Long Leaf Georgia pine is better than either ash or oak where strength and durability are essential.

The agriculturists of Texas are entitled to the best and should give all possible and consistent encouragement to a more general use of the better material.—*Farm and Ranch*.

VENTILATING COAL CARGOES.—It has been a frequent practice to ventilate a cargo of coal with the view of removing the inflammable gases therefrom. That this in itself is an introduction of a source of danger is made clear by Professor Clowers, of Nottingham. From an account of his observations in the *American Gas-Light Journal* we abstract the following:

Four colliers were loaded with coal from the same seam and by means of the same tips. Three were ventilated and the fourth was not; the former were consumed by fire before reaching Aden, while the latter arrived at Bombay in safety. It was evident that the ventilation of the coal had supplied just that air necessary for its combustion when heated which was absent in the case of the unventilated coal. Coal which has been beaten in the air and has begun to cool again is safe from further heating; hence

storing coal in the air for a sufficient time before loading is calculated to insure the safety of the cargo. The following conclusions were reached: First, the danger of spontaneous firing of coal in large lumps is very slight; it is much greater with smaller coal, and greater still with dust. The increase of danger is due to the larger extent of surface exposed to the air in proportion to the mass of the coal. Second, air-dried coal which contains more than 3 per cent of moisture is dangerous; if it contains less, the danger diminishes. The moisture contained is a measure of the absorbent power of the coal for air, and the more absorbent the coal, the more dangerous. Third, the danger is somewhat increased by the presence of pyrites, in large quantity. Fourth, newly won coal should be shielded from the air as much as possible, to prevent the chance of rapid heating, and for the same reason it is best not to stack it in large heaps, since these retain the heat. Ventilation of the coal often adds greatly to the risk of spontaneous firing. Fifth, all external sources of heat, such as steam-pipes, boilers and hot flues in the neighborhood of the coal, add very greatly to the risk. Spontaneous heating becomes vastly more rapid when it is assisted from without.

The Career of the Malaria Germ.

The malaria germ is an animal parasite. It belongs to the lowest grade of animal life, being a protozoan, and is of microscopic size. It seems to make its home ordinarily in the soil. It is plentiful in swamps. Entering the human body through the lungs, the parasite seeks a home in one of the red corpuscles of the blood. These corpuscles are in shape flat, round disks, bearing a curious resemblance, under the microscope, to pieces of money. How essential their well-being is to health everybody knows. The parasite, taking up his residence in one of the corpuscles, proceeds to multiply, forming a little colony. The colony feeds upon the material of the corpuscle, which thus becomes disorganized and is finally destroyed, so that the hostile germs are set afloat in the blood. At the beginning, they were merely bits of protoplasmic jelly, without any particular shape; but now they become free swimmers and have developed long, hair-like paddles. Each one has three such oars radiating from its body. Thus they make their way through the veins and arteries, following the tide of the circulation. This cannot go on to any considerable extent without seriously affecting the health of the individual. The latter is attacked by chills, alternating with fever. Quinine and other remedies destructive to the parasites relieve these symptoms. However, if the patient continues to be exposed to the absorption germs in a malarious region, medicines will cease to have effect. The blood, invaded by hordes of parasites, becomes filled with disorganized red corpuscles, and nature gives up the fight, death ensuing. Now that medical science knows precisely what it has to contend against in the treatment of this hitherto mysterious disease, it may be able to find more effective remedies. Already the discovery has enabled physicians to correctly diagnose many malarial cases which have a way of counterfeiting typhoid fever and other troubles. In such instances the presence of the parasites in the blood, readily ascertained by the microscope, settles the question.—*New York Ledger*.

HOW GOLD IS WASTED.—The \$100,000,000 worth of gold now mined annually is not nearly enough to meet the world's requirements. The yearly wastage of this metal is enormous. Various kinds of gilding consume great amounts of it. It is reckoned that in Great Britain alone 25,000 ounces are used every 12 months for the making of gold leaf, while not less than 20,000 ounces more are employed in the same length of time for manufacturing gilt buttons. The finest buttons of this description are produced by applying the gold in the shape of fine dust mixed into a paste with quicksilver. The mercury causes the gold to adhere to the base metal, after which it is evaporated by heat, leaving the gold on the surface. Large quantities of pure gold are utilized for the plating of other metals and for ornamental pottery; but by far the greatest waste of gold is incidental to its use for jewelry, which consumes more than three times as much of the metal as is coined. Not less than \$30,000,000 worth of gold is devoted every year to making articles of ornament. Nearly all of this is eventually lost, not more than one-fortieth of it ever returning to the hands of refiners or manufacturers. With gold coins the loss by abrasion in the process of circulation is very considerable. To avoid this, natives of India wrap each coin singly in cloth.—*Boston Transcript*.

Metallurgy and Ores.

JOHN TAYLOR & CO.,
IMPORTERS AND DEALERS IN
ASSAYERS' MATERIALS, MINE
AND MILL SUPPLIES,
ALSO CHEMICALS, AND PHYSICAL, SCHOOL AND CHEMICAL APPARATUS.

68 & 65 First St., cor. Mission, San Francisco
We would call the attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our full stock of Balances, Furnaces, Muffles, Crucibles, Scoffers, etc., including, also, a full stock of Chemicals.
Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast, we feel confident from our experience we can well suit the demand for these goods, both as to quality and price.
Agents of the **Denver Fire Clay Co.** and for the **Morgan Crucible Co., Battersea, England.** Also for **E. G. Dennison's Silver Plated Amalgam Plates.** The plates of this well-known manufacturer are thoroughly reliable, and full weight of Silver guaranteed. Orders taken at his lowest prices. Our illustrated Catalogue and Assay Tables sent free on application.

JOHN TAYLOR & CO.

NEW DISCOVERY.

Mines Revived and Miners Enriched

By the wonderful **MacArthur-Forrest Process**, Controlled by the Gold and Silver Extraction Mining and Milling Co., H. A. W. Tabor, Pres.; LEONARD GOW, V. Pres.; H. A. Jones, 24 V. Pres.; P. G. GOW, Techn. Asst.; and Asst. Treas.; T. L. WISWALL, Gen'l Mgr. and Secy.; PETER MCCOY, Treas.; W. L. COOPER, Eng.

General Office of Company:
Rooms 8, 9 & 10, Tabor Grand Opera House Block, DENVER, COLORADO.

Also mills in operation as follows, viz: The Denver Mill, Denver, Colo.; The Livingston Gold Mining Co., Boulder Co., Colo.; The Puzzler Gold Mining and Milling Co., Boulder Co., Colo.; The Cripple Creek Gold Extraction and Power Co., Colo.; Calumet Gold Mining Co., Middle Creek, Shasta Co., Cal.; The Shasta Gold Ex. Co., Middle Creek, Shasta Co., Cal.; The Mercur Gold Mining Co., Fairfield, Utah; Chample's Mine, Humboldt District, Yavapai County, Ariz.; The Crowned King and Last Chance Mine, Yavapai Co., Ariz.; The Union Mines, Maricopa Co., Ariz.; The Revenue Con. Gold Mining Co., Revenue via Norris, Mont.; The Creighton Mining & Milling Co., Creighton, Cherokee Co., Georgia; and others in course of erection.

The object of this company is to introduce the Mac Arthur-Forrest process.
We have purchased from the Cassel Gold Extraction Co., of Glasgow, Scotland, the exclusive right for the United States in two patents covering this process.

If you desire an experimental test communicate with the secretary.

If the results of the tests are favorable, we will then make arrangements to treat a quantity of not less than five tons at Denver.
We are fully prepared to grant royalties to mine and mill owners, or rights covering districts and counties. The price consists of pulverizing the ore to a fineness of about 60 mesh, and then subjecting the same to an action of a very diluted solution of cyanide. A few tubes especially constructed according to our diagrams, for triturating, settling and filtering, is all that is required extra in connection with any kind of pulverizing stamps or rolls.

The total cost, as a rule, does not exceed from \$2.50 to \$5.00 per ton.
The most desirable class of ore for this process be so-called refractory gold ore, pyrites, hematite manganese and tellurium. We have also treated successfully dry silver ore.

We will be pleased to answer any inquiries and furnish any desired information. Address,
T. L. WISWALL,
P. O. Box 926. Gen. Mgr. and Secretary.

Dewey & Co.'s Scientific Press

Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of invention in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the **MINING AND SCIENTIFIC PRESS.** We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

BOOKS ON ASSAYING.

By C. H. AARON.

Part I.—Gold and Silver Ores.

SECOND EDITION—PRICE \$1.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning.
The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:

Preface; Introduction; Implements: Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assay; Examples of Dressing; The Melting in Crucibles; Scoffing; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.
The volume embraces 130 12mo. pages, with illustrations, well bound in cloth; 1889. Price, \$1, postpaid. Sold by DEWEY PUBLISHING CO., Publishers, No. 220 Market Street, San Francisco.

Parts II and III.

Gold and Silver Bullion, Lead,
Copper, Tin, Mercury, Etc.

SECOND EDITION—JUST OUT.

Price \$1.75.

This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.

Table of Contents:

Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Humid Assay of Silver; Gay Lussac's Method; Volhard's Method; Manipulation; Lead Ores; Copper Ores; Tin Ores; Mercury Ores; Zinc Ores; Nickel and Cobalt; Ochromium; Bismuth; Arsenic; Antimony; Sulphur; Salt; Note.
One of the methods given for the Assay of Copper is new, original and exact, as is also one of the processes for Zinc. The book contains 161 pages, with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter.
Price, postpaid, \$1.75. Sold by DEWEY PUBLISHING CO., Publishers No. 220 Market St., San Francisco.

Practical Hydraulics.

A Book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers, and Irrigators.

By P. M. RANDALL.

This new work is by one of the most experienced hydraulicians of the country. It abounds with useful tables for ready reference, in which the results of abstruse calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulae, coefficients, etc., are given; and for those not familiar with higher mathematics, examples, rules, and tables are prepared. Thus the needs of the scientist and the practical miner or millman are each met. It is the most complete work on the subject yet published, and is especially applicable to the Pacific Coast.

Table of Contents.

The following brief abstract of the contents will give an idea of the branches of the subject treated:
General Plan; Discussion of the Principles of Hydraulics; Rules Deduced from Formulas Obtained; Examples and Calculations; Extensive Tables for Ready Reference; Fundamental Laws of Hydraulics Demonstrated and Expressed in Formula and Rules; Flow of Water through Opening; Weir Coefficients; Triangular Weirs; Flow of Water over Quadrant Weir (tabulated); Application of Tables; Submerged Orifices; Flow through Orifices in Thin Partitions; Tables and Applications; Miners' Inches; Tables and Calculations; Flow of Water through Short Tubes and Compound Tubes; Flow of Water through Pipes; Tables of Velocities and Cubic Feet Flow for Given Fall per Mile and Diameter of Pipe; Coefficient for Bend—Circular and Angular; Flow through Nozzles; Inverted Siphons; Flow of Water in Open Channels; Extensive Tables; Rough and Ready Notes; Hints for Speedy and Approximate Estimates, etc.

Price, \$2.00, post-paid. Sold by DEWEY PUBLISHING CO., Publishers, 220 Market St., San Francisco, Cal.

Mining Summary.

The following is mostly condensed from journals published in the interior. In proximity to the mines mentioned.

CALIFORNIA.

Butte.

RICH QUARTZ.—Oroville Register, April 15: The owners of the Mascot quartz mine, in Oregon gulch, have struck a bonanza. Last week they ran into a chumney where the gold was extraordinarily rich. A single candle-box of the rock was estimated to contain \$300 worth of gold. A mill is to be erected and the contract calls for completing it in 35 days. The mill will be operated by water-power from the Hendrick's ditch, and there will be an abundance of power, as there is a fall of over 200 feet. The mill will be built on a level with the lower tunnel, so that the rock can be handled rapidly and cheaply. This mine, under the name of The Armstrong, was worked many years ago, and it is said 1200 tons of ore paid \$85 a ton. The owners are Woodland capitalists, and they will spare no expense to make this a first-class mine, so far as developments and equipments are concerned. Those familiar with the rock say the quartz is rich, the ledge of good width, and there is a quantity of ore now in sight.

Calaveras.

NOTES.—Mt. Echo, April 15: It is currently reported in this section that an immensely rich strike has been made in the 700-foot level of the Matson mine. It is reported that the Jones mine is looking well and the prospects are very favorable for developing a first-class paying property. The Brunner mine is being pumped out for the purpose of examination by a San Francisco party, who, if satisfied with the mine, intends buying it. Notwithstanding the fact that there are a large number of men employed in the mines of this town, money is scarce and there is a lack of life and stir in the place. Schwartz & Co., who are working their mine on Birney's ranch, inform us that the shaft is now 40 feet deep, and that the vein at that depth measures six feet in width. The ore carries free gold in paying quantities, besides a high grade of sulphurets. Wm. Osborne has been prospecting a vein of quartz in the vicinity of the Hardy mine, near Albany Flat, for some time past, and the other day he struck some good paying ore and a nugget valued at \$5. Indications are favorable for the development of a rich pocket and Billy is not losing any time hunting for it.

Inyo.

SILVER-LEAD MINING.—Inyo Register, April 15: The following gives, in a general sort of way, some idea of what is being done in silver-lead mining in the camps sending ores to the railroad at Keeler: Three carloads, or about 30 tons, of ore are shipped from this latter point weekly, on an average. J. J. Gunn, at the Minnetta, the farthest of these mines from Keeler, is working seven or eight men, and has between 40 and 50 tons of high-grade silver-lead ore ready for shipment. Fitzgerald, at the Modoc mines on the north side of the same hill, is working about the same number of men and is taking out ore in paying quantities all the time. Frank Silva, at the Columbia mine near Darwin, has on two carloads or more of fine ore ready for shipment. He employs three men. E. A. Reddy, at the Defiance, is working seven or eight men, but for two months past has been sinking the main incline, the better to extract ores from below the 400-foot levels. It will take a week or ten days yet to connect the incline with the tunnels or workings previously made at that depth, but from which the ore had to be handled not less than three times before it came to the steam hoisting works, hence the sinking of this incline. McKenzie, at the Lucky Jim mine, is shipping a carload or two of ore, and, with a light force, is taking out ore all the time, though not in such quantities as in times past. The Newtown Co., at Cerro Gordo, is working eight or nine men, and is sending down about three tons of ore every day. Tom Boland, lessee of the Union mines, same place, is working about the same number of men, and will begin hoisting ore by team in a few days. He is also handling a good deal of fine dnet by the jigging process. The low price of silver has depressed mining work in all these camps very much; nevertheless, there is more being done in mining these silver-lead ores than is generally supposed.

THE SODA WORKS.—The Inyo Development Co. at Keeler is working 30 men and a corresponding number of teams—over 40 horses in all—in the construction of new vats. It has now about 50 acres of vats, and is running one pump which keeps a stream of 50 inches of water flowing into the vats constantly. It is shipping now only one carload of crude soda every week, but in due time will vastly increase its shipments.

Nevada.

SHORT MINING NOTES.—Grass Valley Union, April 12: The mining outlook in this district is very encouraging for the year, and we hope to see several new mines commence and old ones to resume operations as soon as the weather will permit. This section of the country has long been recognized as one of the leading mining sections of the globe, and this, with what our mines have yielded to their owners, is making us very prominent in the opinion of wealthy mining men. In conversation with a man who is prominent in mining circles in this vicinity, and whose opinion is always consulted before making any attempt to develop a mine, a Union reporter learned the following news about the several mines around our city: The St. John mine, which is situated near Alta Hill, has commenced sinking again, and have struck a lead of ore that looks better and is more solid than any they have ever

taken out. The North Star mine, one of the oldest quartz mines that is being worked, is taking out some splendid rock. The company have declared one dividend this year of \$50,000, and they expect to make two more of a like amount during the remaining part of the present year. They are working at a disadvantage, having an enormous amount of water to contend with. Their excellent pumping machinery, however, is able to handle it all. A mine which will surprise the people in this neighborhood in the near future is the El Dorado and Geyboand mine, situated near Alta Hill. There is a ledge which is from three to seven feet wide, and which appears to be a very strong one. The ledge runs down toward Slate creek, in which region some rich ore was taken out in early days. The mine has been bonded for two years, and work will be commenced as soon as the weather gets settled. Messrs. Dawson, Coffin and others have a gravel claim, which is an extension of the old Alta Hill gravel channel, that they are working. They expect to strike a channel of gravel any day. The tunnel caved in some time ago and has just been cleaned out. They will make an upraise shortly to tap the channel. Work is not being pushed at the Illinois mine, located beyond the Omaha. The shaft was not properly constructed at the mouth, and a cave was the result, being occasioned by the recent heavy rains. The mine is owned by James Lakenan and others. The Gold Flat mine, of which John Skewes is superintendent, is looking well. They have run a drift in the 200-foot level to the length of 900 feet. This is only one of Mr. Skewes' several successes of developing a mine. The property is situated at Gold Flat, just below the Pittsburg, and on the line of the Narrow Gauge railroad. The Evening Star, or Seven-Thirty mine, is taking out some fine ore, which they will soon crush and determine the real value of it. This mine will be remembered as the one which paid in such large quantities several years ago. It is a pocket ledge, and when found they are very rich. It is owned by a stock company and superintended by Mr. Taylor. The Wyoming mine, of which Mr. Wallace is superintendent, has been undergoing improvements during the past winter. Their boiler burned out two or three months ago, and a new one has been put in its place. The mine will probably commence operations next week.

WASHINGTON DISTRICT.—We get the following Washington district mining items from the Nevada City Herald: Work has been resumed at the German mine, Washington district, under direction of the new superintendent, Mr. W. S. Lillian. The new mill, which is now being put up, is in charge of O. M. Eastman. Mr. M. D. Cooley, who has spent four years in bringing this mine to a successful footing, has resigned and left the district for the present. The San Jose mine, which is about to resume operations will be superintended by a Mr. Long of San Jose. Charles Cairns will be foreman. The Board of Directors held a meeting at San Jose last evening to arrange details. The Blue Jay people have started a new tunnel to tap their ledge several hundred feet below their old works. M. A. Bauch is superintendent. H. M. Place, who is working the Rocky Bar, has started up his pumps again, and will put on men again in a few days. The winter's storms have interfered with operations a good deal.

THE BALTIC MINE.—Grass Valley Union, April 13: The Union is able to announce some news this morning that will surely be well received by the stockholders of the Baltic mine. It is no doubt understood by all that the present stockholders merely have the property bonded from Dr. Hays, Chas. Johnson, A. B. Brady and one or two others. The bond is for \$20,000, and the time that was first given to pay this amount was May, 1894. Many felt that the time was somewhat limited, and believed it would be almost impossible to determine the worth of the property in that short period. So last Tuesday evening Superintendent Snyder met with the original owners and asked to have the time of lease extended one year, which would date it to May, 1895. This the owners of the mine consented to, and the papers were drawn up to that effect. Mr. Snyder informed a Union reporter that the company will have ample time now to thoroughly develop the mine and take out more than enough gold, if it is there, to pay for the property. Of course, if the gold is not there they don't want the mine. The ledge is looking better every day. At present it runs from one foot to 20 inches in width. The tunnel is being pushed along the line of the ledge just as rapidly as possible. It is in 700 feet now. At the end of the tunnel a raise has been started, which will run through to the surface, a distance of 160 feet. The purpose of the upraise is to furnish air, and also to be used as an escape in case of necessity. A shift is at work right along in both the upraise and main tunnel. We were also informed that a five-stamp mill would surely be pounding away inside of two months. Work will be commenced on the mill just as soon as the weather will permit.

Hudson Bay.—Grass Valley Union, April 16: Work at the Hudson Bay mine is being pushed actively at present and about eight men are employed. There are five different shafts being prospected in the region of the Rocky Bar mine and some good rock is unearthed. The shaft at the South Idaho is down to the depth of 45 feet. The new steel whim recently placed on the property is a great improvement and does good work. E. C. Mead, of Sacramento, and Mr. Boardman, of San Francisco, in company with Geo. Gill and D. E. Matteson, went down to the Baltic mine yesterday to have a look at the mine with a view of investing. They are highly pleased with the looks of the mine.

FROM THE PERRIN MINE.—Grass Valley Union, April 16: Some fine-looking rock was brought to town yesterday by Orin Perrin from the Perrin mine, about three miles below town.

The Perrin Bros. own the mine, and if the rock brought up yesterday is a fair sample, the boys have a fine piece of property there. The rock was taken from a depth of about 600 feet, and the ledge is from 18 to 20 inches wide. The rock will pay about \$80 a load. The mine employs about 16 men and is looking well. It is the intention of Mr. Perrin to ship the rock that was on exhibition yesterday to the World's Fair.

THE KENTOCK.—The above-named mine, situated beyond the Idaho, is actively at work taking out rock. They are down to a depth of 100 feet and are running a drift from that level. Thirty loads of rock have been hauled to the Crown Point mill, which will soon be crushed and the real value will be known. They have a three-foot vein, and it appears to be a strong ledge. Six men are kept at work on the property, and the men who are working the property say they have a good mine.

Placer.

PAID ANOTHER DIVIDEND.—Grass Valley Union, April 15: The stockholders of the Morning Star mine were gratified to learn yesterday that the mine had yielded a dividend of \$1 per share. This mine, which is located at Iowa Hill, is owned chiefly by Grass Valleyans, and a dividend causes quite a little cheerfulness in the faces of some of our citizens. J. H. Neff is superintendent.

Plumas.

A QUARTZ MINING COUNTY.—Cor. Plumas National Bulletin, April 15: Is Plumas a quartz mining county? This question has been asked me by several men of means who wish to invest in mining property. From 13 years' experience as a quartz miner and prospector, and from what I have seen of Plumas, I must say that she is such a county. My reasons are these: First, Plumas lies in the center of a mineral belt that extends from North to South America. Here this belt is 50 miles wide. It has several quartz mines that have been paying dividends for 25 years. Scarcely a stream flows from this belt that has not been worked for placer gold. Nine-tenths of these streams have furnished quartz gold specimens and good milling ore. The same can be found to-day. I am aware that mining men do not wish to buy mere specimen mines, but the quartz mines in Plumas have furnished not only large bodies of good milling ore, but rich free-gold specimens as well. In most of the ledges of this county, the quartz is of a soft nature and free-milling. This is the reason more mines are not shown. Most of the veins are capped over, are decomposed, and need men of experience to find them. Plumas is thought of to-day by some as Trinity and Shasta were in 1876—that is, believed to be a county of "pocket" mines. This idea is wrong, for defined ledges can be traced for several miles. In most cases, the failures in Plumas have been the result of bad management. If men would do more development work before building mills, they would reap better success. It should be remembered that not all good prospects make good mines. This is true in any county. One man with a little "get up" collected sufficient samples from different mines in Plumas to win the gold medal at the recent Mechanics' Institute Fair in San Francisco. With proper assistance, Mr. Taylor will be able to display at Chicago as good a collection of Plumas minerals as can be shown from any county.

San Bernardino.

VANDERBILT DISTRICT.—Cor. San Bernardino Times-Index, April 15: I see an article going the rounds of the press that Vanderbilt mining district is an old mining camp, having been worked and abandoned many years ago by Senator Jones & Co. Such are not the facts. In 1874 Jones & Co. bought and operated mines in the Panimint mountains, which lie something like 200 miles north from this camp in Inyo county. The Panimint mines were silver, while Vanderbilt veins are all or principally gold. The truth is that these mines were never worked, or even so much as discovered until found by the Indian, Boh Black, and located by M. M. Beatty. New York district is located over the range and some eight miles south from this camp, and is now being worked by Denver parties. It was first discovered and worked away back in the '60s. It is only within the last few years that prospectors have been aware of, or even so much as expected, the presence of gold veins in this so-called desert region. The truth is that gold is found outcropping in but few places in all this vast stretch of country, the gold veins being generally capped by hematite of iron and sometimes, as is the case here in this district, associated to a greater or less extent with galena ores. I do not mean by this that the Vanderbilt mines carry galena to any appreciable extent, but here and there in many of the veins thus far prospected lead ore (galena) is here and there encountered, and is looked upon by the prospector as a pretty sure indication of finding gold. But little free gold is visible in the ores of this district, it being more generally found in the iron sulphurets. There is no question but what many valuable discoveries will yet be made in this vicinity now that prospectors have learned the character of the veins and the nature of the ores. In truth the desert—as you people insist on calling this section—will soon and is now taking on a new lease of life. I hear almost daily of new and valuable discoveries. Another important lesson the prospector has learned is that he must do development work if he expects to find a mine—sink a hole on his vein. Some of the best prospects in this camp gave only from \$4 to \$10 on the surface. The Bonanza people have acquired the interests of M. M. Beatty in the great Beatty lode of this district, the three first locations made in the district, all on the same vein, and upon which a force of men will be soon set at work. This important mining deal, when fully completed,

will place in the hands and under the control of the Bonanza firm the two great veins of the district, and insures the future of Vanderbilt. The work on the new railroad has been somewhat retarded of late, owing to the non-arrival of material, such as rails and other supplies necessary to a rapid construction of the road. It is now surveyed and the line established to and a few miles beyond this place. Since my last, an election for District Recorder has been held, at which meeting many new features and laws to more fully govern the district were introduced and adopted, and William McFarlane duly elected Recorder for the ensuing year.

NEW DIGGINGS.—San Bernardino Times-Index, April 15: Frank Meacham has just returned from the new placer fields at Borax lake, 150 miles northwest of this city, discovered some six weeks ago by himself and Ramsey Cox, and reports rich returns. He says the gravel is rich and bedrock is found at a depth of only four feet. To those not acquainted with mining operations it is explained that the gold in placer digging is found at bedrock, and the amount of labor involved in getting it out is, of course, proportioned to the depth at which bedrock is found. In this case the diggings are shallow and the gold is easily reached. When the fields were discovered, Meacham and Cox thoroughly prospected them and each located 20 acres, the limit allowed by mining law. They then informed a number of their friends of the richness of their discovery, and these likewise located. The find has been kept very quiet and this accounts for the fact that nothing has been heard of the new diggings. At present there are about a dozen men working at the diggings, but Mr. Meacham states that all the desirable locations have been taken up. At first the men labored at considerable disadvantage, owing to the lack of "washers" in the camp, and were compelled to carry the dirt on their backs to the lake, a distance of half a mile from the diggings, where it was washed in "cradles." Even by this slow and primitive method, however, excellent returns were reaped. Mr. Meacham reports that during the first seven days he was at work he washed out \$10 in dust and nuggets. The locators have now bought "dry washers" and the dirt is said to be worked closer by this process than if water and amalgam plates were used. The placer diggers are making an excellent thing out of the field. A return of \$10 a day is considered small, and some are getting out as much as \$25 or \$30 for a day's work. There are two ways of reaching the fields. One is to go out by wagon from here. Another, and by far the more preferable route, is to take the Southern Pacific to Mojave, and from there proceed by wagon over the old Borax road, a distance of 50 miles. Old miners, seen this morning by a Times-Index representative, say the field is virtually unexplored as yet, and that some exceptionally rich discoveries may be expected.

Sierra.

GOLD BLUFF MILL.—Mt. Messenger, April 15: This is undoubtedly the best built quartz mill in this county. The building is a very substantial structure of imposing architecture, but, unlike the usual mills of this kind, the rock-breakers are set below the level of the battery, from which, by an automatic elevator, made by the Link Belt Co. of Chicago, Ill., the crushed quartz is elevated about 40 feet and thence discharged into a large bin capable of holding about 500 tons. The procedure is as follows: The ore cars are run into a little addition of the main building and thence discharge the quartz into the rock-breaker bin, thence to the rock-breakers and by elevator to the large bin. The reason of this change from the customary gravitation mills (where quartz is dumped at top of mill over grizzlies, coarse rock only going through the rock-breakers) is the location of the tunnel run by the former owner to suit the old mill erected on this site in 1860, obliging Supt. Wm. Kraft to change the program generally followed in quartz mills—and it seems to us that he has overcome this difficulty in the most practicable manner possible. The mill contains 20 stamps, arranged in two sets of 10 stamps each, which can be run together or separate as may be necessary. There are four mortars, of the latest improvements, each weighing 6450 pounds, stamps 850 apiece, dropping five inches, about 90 times per minute. Arrangement of the plates is the most convenient we have seen. About 350 feet of one-eighth inch copper plate and an ounce of silver per square foot will be used. The battery frame is of the most substantial character, entirely independent of the building and battery floor. Self-feeders of the most approved pattern will supply the mortars with quartz. Sulphurets will be saved by perfection copper-plate concentrators, and tailings with percentage of gold worth saving will be eluted to the outside of the building and pumped automatically to the next step for elorage and future treatment. An amalgamating barrel and batea completes the arrangements for treatment in the mill. Water power, through a 16-inch hydraulic pipe with a vertical fall of about 270 feet, from a ditch above the tunnel, is conveyed to the machinery by three Dodds' improved wheels: First, five feet diameter, driving two rock-breakers and an elevator, with a governor to regulate the power needed; second, six feet diameter—stamps, batea and harrel; third, two feet diameter—concentrator. Arrangements for fire hydrants are of the very best kind, trial test through four-inch hose and inch nozzle proving that a stream can be thrown high above the mill and other buildings in the camp. One hydrant is outside and two inside the mill. The Gold Bluff camp contains, besides the mill, assay and retort house, a new blacksmith shop, lodging-house, store-room, etc. The quartz (which to us appeared as very rich stuff) is being hauled out of the mine as fast as the present facilities permit. The rock-breakers and elevator capacity are equal to three times the quantity of quartz that

can be hauled at present out of the mine. The big bin was about one-third full when we saw it last Monday and will probably be closed by the close of the week. The building to contain the assay office and retort room is nearly completed. Supt. Kraft said that a trial test of the battery would be made on Saturday of this week, but the mill will not be run regularly until the assay outfit is in position, so that the pulp during the process, from the beginning to the tailings, may be tested. Taken altogether, the mill is a credit to the county as a whole, and Downieville in particular.

Siskiyou.

GOLD.—Yreka Journal, April 17: According to the mining statistics, Siskiyou is the only county in the State showing increased annual yields of gold, and stands second as a gold-producer, Placer being in the lead. This county is attracting more attention among mining men than any other section of the entire coast, and is destined to become a rich field for the investment of capital in quartz, placer, hydraulic and river mining. The Yreka Blue Gravel Mining Co. at Greenhorn, just south of Yreka, now works eight hands to a shift, running the apparatus day and night in hoisting pay gravel and keeping the water drained. Good pay is realized and the body of blue gravel increasing in thickness as the work progresses. This claim, when well opened and extended up the creek some distance, will undoubtedly pay handsomely. The Scott Valley News says that quartz yielding from \$10 to \$20 per ton, in ledges ranging from 20 inches to 4 feet in width, is reported in Quartz valley.

Trinity.

BOUGHT ANOTHER.—Shasta Courier, April 15: We are informed that the owners of the Brown Bear mine this week bought the McDonald mine at Deadwood, which adjoins the Brown Bear.

UNPRECEDENTED SHOWING.—Trinity Journal, April 15: The showing made by the Trinity River Hydraulic Gold Mining Company on the Hubbard mine during the time they have had water on the property is unprecedented since "the days of '49." Last week we mentioned the clean-up from the flumes after 125 hours run with 300 inches of water. Since that issue the under-currents have been cleaned up and about \$1000 realized. This, with the \$4000 clean-up from the flumes, makes fully \$5000 for the 125 hours run of 300 inches of water. The water is steadily increasing and the production will no doubt increase proportionately. Since "the days of '49" we know of no mine in this county that has made such a showing in the same length of time with the same quantity of water. The bedrock ditches have not been cleaned up yet and it is estimated by all good hydraulic miners that about one-half of the gold remains in these ditches, particularly where the gold is heavy and coarse. The bedrock is pitching back where this company is now working and the prospect for a mountain of gravel is excellent. It is estimated by competent judges that sufficient gold will be taken out this season to put the company nearly even, if not entirely so. The ditch stands exceedingly well and the property is managed very economically by A. G. Dunbar, and the investment is considered one of the best that has been made here for many years. One other clean-up (the first) was made from the upper flume after a run of 42 hours and the result was 80 ounces, or a little over \$1500, making the total output a little over \$6500 for two weeks' work. So far the results have exceeded Mr. Dunbar's estimates, showing that he is careful, non-visionary and a safe man to handle a large property.

WORK BROINS AT CINNABAR.—Trinity Journal, April 15: While D. G. Reid, Esq., was in San Francisco last week, he met A. McCaw and W. J. Simpson, two of the directors of the Integral Quicksilver Mining Company. They informed him that they would leave for Cinnabar on Sunday, the 9th inst., and would start up the works for the season. The furnace-men also went to Cinnabar last Sunday. It is the intention of the company to work their mines on a large scale. This summer over 100 men will be employed, and as the mines develop, more men will be added. They already have one large furnace erected and will build two more. The roads leading to Cinnabar are in frightful condition and will retard work in the camp materially the coming season. Supt. McCaw is much pleased with the prospects of the mines. The Cinnabar group of mines comprise the finest deposit of cinnabar ore in the State and a few years will see New Almaden repeated in northern California. The ore is very rich and found in large veins. On the Boston mine recently a crosscut showed a 40-foot vein of high-grade rock. The principal companies operating at Cinnabar are the Integral of New York and the Altona of San Francisco. In addition, there are a large number of locations and patented claims on which but little work has been done. Cinnabar has a bright future and will undoubtedly be the greatest mining camp in northern California.

OUR GOLDEN STREETS.—Weaverville Journal, April 15: A party of gentlemen were sitting in the office of the Union Hotel last Monday talking placer mining and about the pay gravel in and about Weaverville basin, when the assertion was made that a good prospect could be obtained in the streets of the town. An Eastern gentleman present thought this remark a little difficult of digestion, whereupon Mr. Panson took a shovel and pan and, accompanied by the party, took a panful of dirt from the street in front of the hotel. The dirt was washed, yielding about 30 colors, several quite coarse. The gentleman was convinced and, carefully folding the "clean-up" in a piece of paper, put it in his pocket to show his friends. He said it was the first town he was ever in whose streets were paved with gold.

NEVADA.

Washoe District.

CON. CAL. & VA. MINE.—Virginia Chronicle, Apr. 15: 1500 level.—Have continued to extract ore and old fillings in working upward in the old south stope, from the 10th to the 15th floors above the sill floor of this level. 1600 level.—Are repairing the main south drift and the east crosscut leading therefrom to the upraise connecting with the north drift on the 1500 level; also extracting a few tons of ore from the old stopes east of the main south drift. 1650 level.—Have continued making necessary repairs to the drifts on the sill floor of this level. We continue to extract some ore from the old stopes, eight floors up in the upraise No. 6, carried up from the main north-west drift; also from the old stopes in working north from the crosscut run west from the north-west drift. From the drift run west from these north workings, 27 feet up, the upraise started 50 feet in from the mouth of the drift, has been carried up 27 feet; total height, 41 feet; the top being in a quartz formation carrying a low assay value. Have continued to stope out ore of fair quality in working on the north and south sides of the drift run east (at a point 20 feet down) from the winze which was sunk from the crosscut run west from the main north-west drift. Have extracted during the week from all parts of the mine 655 cars of ore, about 645 tons. Shipped to Morgan mill 665 1990-2000 tons of ore. Average assay value, per railroad car samples, \$38.44. The assay value per battery sample of all the ore worked at that mill during the week (630 tons), was \$32.63 per ton.

OPHIR.—500 level.—Jointly with Mexican Co. continue doing necessary repair work in the west drift from the main shaft. 1565 level.—The winze now going down below the sill floor of this level has been sunk during the week 8 feet; total depth, 52 feet. The bottom is in porphyry and clay showing streaks of quartz which carries a low assay value. We have commenced the work of enlarging this winze by carrying up from the bottom a second compartment. It will take all the coming week to complete this work, and then we will begin the running of crosscuts from the bottom of the winze.

MEXICAN.—On the 1565 level.—West crosscut No. 2 from the north drift from the east crosscut from the bottom of the winze, sunk from the 1465 level down to this level near the south boundary, has been extended 21 feet; total length, 131 feet, continuing in a softer porphyry formation carrying clay separations and showing fine lines of quartz. 500 level.—Have continued making necessary repairs, jointly with the Ophir Co., in the west drift from the Ophir shaft on this level.

UTAH.—340 level.—West crosscut No. 3 from the north drift, from west crosscut No. 2, at a point 195 feet in from its mouth, has been extended 12 feet; total length, 93 feet; in quartzite and clay formation, with several inches of water flowing from the face.

SIERRA NEVADA.—The intermediate tunnel on Cedar Hill has been advanced during the week 16 feet, making the total length 232 feet; the face is in porphyry. The joint Sierra Nevada and Union west drift, 900 level, has been advanced 21 feet, making the total distance west of the joint shaft 3100 feet; the face is in soft porphyry and clay.

UNION SHAFT.—The joint Sierra Nevada and Union west drift, 900 level, has been advanced the past week 21 feet, making the total distance west of the shaft 3100 feet; the face is in soft porphyry and clay.

ANDES.—On 420 level north drift from east crosscut No. 1 north, advanced 16 feet; total length, 217 feet; formation, porphyry and streaks of quartz.

GOULD & CURRY.—200 level.—During the past week west crosscut No. 5, started in north-west drift, 432 feet from main west drift, has been extended 10 feet, passing through porphyry; total length, 426 feet. Suro tunnel level.—We have resumed work in the joint west crosscut which was started in the end of the east crosscut from joint north drift and expect to make the connection with the winze the coming week.

BEST & BELCHER.—200 level.—The north-west drift has been extended 17 feet, passing through clay and quartz; total length, 232 feet. 900 level.—The southwest drift started in west crosscut No. 3, 20 feet from top of upraise No. 1, 1000 level, has been extended 22 feet; total length, 100 feet; face of drift in porphyry and seams of clay. Suro tunnel level.—We have resumed work in the joint west crosscut which was started from the end of the east crosscut from the joint north drift, and we expect to make the connection with the winze the coming week.

HALE & NORCROSS.—In the main shaft are easing the timbers between the 1000 and 1100 levels. Main Incline.—We continue making the necessary repairs. 1800 level.—Advanced west crosscut on our south boundary 15 feet; total length, 88 feet; face in porphyry and quartz.

CHOLLAR.—Work in the mine was suspended on the 9th instant, owing to necessary repairs being made to surface machinery; work was resumed on the 14th instant.

POTOSI.—Work in the mine was suspended on the 9th instant, owing to necessary repairs being made to the surface machinery. Extracted and sent to mill the past week 143 tons and 1000 pounds of ore from the 550, 930, 1000 and 1150 levels. Milled during the week 200 tons. On hand at mill, 84 tons and 1500 pounds. Average battery assays, \$22.71; average car sample assays, \$23.84.

OCCIDENTAL.—The main north drift on the 760 level has been extended 9 feet; total length, 721 feet; face is in hard footwall. The

upraise above No. 2 winze in south drift, 750 level, is up 103 feet; the top shows ore of fair quality. The Zagid drift, Suro tunnel level, has been extended 10 feet through hard porphyry; total length of main drift, 922 feet.

KENTUCK.—We continue to extract from two to three tons of ore per day from the 160 level of the average value of \$32 per ton. Have started an east crosscut from the end of drift on 1100 level near Jacket south line; the face is in ore of fair grade.

CON. NEW YORK.—The south drift from the bottom of the winze below the 650 level is in a distance of 8 feet; the formation is quartz, some of which gives fair assays. The south drift from No. 4 west crosscut, 800 level, is in a distance of 10 feet; the face is in soft porphyry.

SILVER HILL.—The southeast drift on the 450 level has been advanced 5 feet during the past week, making the total distance from north line, 93 feet, the face is in hard porphyry.

Morey District.

AN IMPORTANT STRIKE.—Eureka Sentinel, April 15: David Smith returned last Tuesday from a visit at Morey, Nye county, Nevada. He informs us that a strike of great importance was made last week in the Magnolia, one of a series of mines principally owned by H. A. Cohen. The strike was made in the Keyser tunnel, at a depth of about 530 feet from the surface. The ledge matter varies in width from 6 to 18 inches, all of which assays from 300 to 400 ounces in silver and some of the assays run as high as \$1600 per ton. This is an important strike, for the reason that the knowing ones have always croaked and said that the ore did not go down. The late strike has demonstrated that the ore does go down, and there is no telling to what depth it will go.

COLORADO.

CRIPPLE CREEK MINES.—Cor. Denver State Mining Journal, April 13: A claim is being worked by E. Daniels in the rear of the Grand View Hotel in which a 30-inch lead has been struck. The shaft has been sunk to a depth of 40 feet, and an assay of \$36 has been obtained from the pay streak. The Isabella Company has commenced hoisting ore from the Buena Vista shaft after a shut-down of 60 days. The hoisting plant is the most complete in the camp. The shafts and drifts have been thoroughly re-timbered and put in good shape during the shut-down. It is expected that this property will be a considerable shipper to the smelters during the coming months. A large body of ore is in sight ready to be stoped out. J. K. Mullen has sold to C. V. der Bryce an undivided half interest in the Fisher lode on Beacon Hill for \$3000. There were sold yesterday 66,000 shares of Jefferson stock at 1 1/2 cents per share. Progress is being made in the Hidden Treasure, on Bull mountain. The shaft is down 100 feet, and drifting is about to be commenced. It is hoped to catch the Pharmacists vein. The Victor Company has declared a dividend of five cents a share. This company is stocked for 200,000 shares. The dividend thus amounts to \$10,000. The Beaver Park stamp mill has started on a contract to treat the ore of the Pharmacists Company. A half interest in the Gold Dollar. Areqa townsit claim, has been bonded by T. G. Jackson and J. Sheridan from George Mayhew for a consideration of \$15,000. Some specimens of wire gold are stated to have been found in the Gold Dollar. Three shifts have been put on to work on this claim. There is a reported strike of rich ore on Saddle mountain, 12 miles west of the camp. The Mollie Kathleen is a promising claim near the Gold King, and has been worked steadily during the past year. Recent assays and mill-runs from this property show a fine body of ore running from \$26 to \$78 per ton. A five-months bond has been taken on it by Col. J. Hutchinson of San Francisco, and a force of men has been put on for a further 100 feet of development work. This claim will probably be a shipper within the next few weeks. A strike has been made on the Lottie, located on Bull mountain a little north of the Blue Bird. Recent assays on the ore from this claim returned an average value of \$50. A fresh attempt is about to be made to work the Pike's Peak placer to some advantage.

MONTANA.

THE PARROT SMELTER.—Butte Inter-Mountain, April 15: Official denial is made of the statement that the Parrot smelting plant is to be moved. Nevertheless there must have been something more than empty gossip in the stories printed about the Big Hole river scheme, and time will demonstrate the precise significance of those stories. This newspaper is gratified to learn that the old plant will remain on its present site, because it employs several hundred men who have built homes near the works and who could ill-afford the depreciation in their value which the removal of the smelter would bring about. It may be that the Parrot intends to build a new plant on the Big Hole with a refinery and run both the old and the new one. The fact that the old works are not to be removed simply calls attention to the necessity of immediate action in the matter of submitting to the people the proposition to bond the county to raise money for the abatement of the smoke nuisance.

A LOSS TO MONTANA.—Close upon the heels of the departure of J. H. Robinson of the Drumhoun comes that of Mr. W. W. Adams, who, on Saturday, will leave for Colorado to take charge of the Bassic mine, one of the great properties of that State, which has for some time, we believe, been idle. Mr. Adams for many years had charge of the Hope mine at Phillipsburg, was afterward connected with the Blue Bird of Butte, and still later with the Iron Mountain in Missoula county. He is known throughout Montana as a capable, experienced and practical miner, and his departure will cause general regret in mining circles in this State where his success in his

business, his perfect honor as a gentleman and his uniform courtesy have made friends of all who have known him.

NEW MEXICO.

THE PACIFIC SHUT DOWN.—Silver City Enterprise, April 15: Last week Superintendent Spiller of the Pacific Gold Mining Company, of Pinos Altos, was notified by the Silver City Water Company that the mill would have to suspend operations for a short time until the water company's reservoir was replenished. On notifying the company it was decided to shut down the mill and mine. The probabilities are that operations will not be resumed until the company takes some steps for the reduction of their ores at the mine. The mill at Silver City will be moved to the mine and water procured from one of the many sources of supply near Pinos Altos. It may be months, perhaps years, ere the mine and mill will be started again. The property is a good one and would pay well if the company would give their practical superintendent, Mr. Spiller, half a show to work it. During the past year \$36,000 has been paid for hauling, when two-thirds of that amount would have paid for moving the mill and piping water to the mine. The sum annually paid for hauling would alone be a large income for the company, and pay fully 25 per cent per annum on the total amount actually invested in mine and mill after it was moved.

OREGON.

THE GOLD DISTRICTS.—Baker City Democrat, Apr. 7: In view of the demand for gold properties and the scarcity of favorable fields for operation, it is encouraging to the people of this part of Oregon to know that almost at their door exists just what the mining world is looking for—districts where gold deposits are to be found—a field for operation that eclipses any other part of the Northwest; in fact, a section of country that presents better opportunities for the investment of capital, and offering better guarantee of good returns on the money invested, than any other section on the Pacific Coast. The first districts calling for mention, on account of their proximity to Baker City, are the Virtue and White Swan, lying in a purely gold belt extending east from this city to Snake river, a distance of 30 miles. The Virtue mine has long been noted for the richness of its ore deposits, and the extent and value of its product is being manifested daily, the mine being operated by a ten-stamp mill on ore from the upper levels. As soon as the mine is cleared of water, the work of which is under headway with a Knowles pump, an additional force of miners will be added and ore from the large deposits in the lower level will be extracted. The Virtue is making such a showing as gives great encouragement to the stockholders of the company. Of the White Swan mine, if the truth was said regarding the richness it has developed in the few months it has been operated since its discovery, the facts would hardly be believed, for its wealth has been something like marvelous. Suffice to say that the ten-stamp mill running on the property is turning out bullion at the rate of \$500 per day. Other properties in the vicinity of these mines are being developed with good prospects, and the outlook is very favorable for several other producers to be added to the list in the near future. In Cornucopia and East Eagle districts a splendid showing of gold deposits exists, and the properties that are being operated are fully demonstrating the merit of the camps. In the Connor Creek district and on Burnt river is a gold belt that promises much, and there will be energetic prospecting done this summer. Several companies have already taken hold and have bright prospects. The Robinsonville and Smpster districts and country tributary present a field not often found, and development already accomplished is a fair indication of the extent of the gold deposits in this part of Baker county. The hub around which the mining circle swings is Baker City, and from this point all roads lead. The camps are easy of access, and there is every facility for mining.

Mining Share Market.

A better tone has been apparent in the stock market during the week, and prices have been somewhat strengthened. Transactions have been larger in volume, though no very heavy business is reported. Operations in the Chollar and Potosi mines have been resumed, the new engine shaft having been put in place. The Nevada mill has started up 25 stamps on ore from the Chollar and Potosi mines. Pretty good ore is coming out of Con. California and Virginia. Mr. John W. Mackay will leave in a day or two for Colorado, San Diego county, and return in about two weeks. By that time probably Mr. Eckert will have his report ready on the feasibility of pumping out the Comstock lower levels.

In another column of this issue will be found the announcement of The Crane Co., who have been appointed agents on the Pacific Coast for the following brands of belting: Hoyt's short-lap leather belting, Gandy Belting Co. and Boston Belting Co. Mr. W. T. Lally manages the affairs of this great company on the Pacific Coast. The Crane Company are perhaps the largest manufacturers of pipe fittings, brass goods, etc., in the United States. Their place of business is at 405 and 407 Market street, San Francisco, California.

To the World's Fair!

WEEKLY EXCURSIONS!

Are you going? If so, call on or write to the undersigned before arranging for your trip. The "SANTA FE ROUTE" is the only line under one management from California to Chicago! Palace and Tourist Sleepers through to Chicago every day without change! Excursions every Tuesday. W. A. BISSELL, O. P. A., 650 Market Street, Chronicle Bldg., San Francisco, Cal.

Market Reports.

The Markets.

SAN FRANCISCO, April 20, 1893.

A notable event in silver circles during the week was a threat of Secretary Carlisle to redeem treasury notes with silver. A Washington dispatch says: "Under the Silver Act of 1890, there is at present outstanding \$130,000,000 in notes, and they are being constantly redeemed in gold at the New York Sub-Treasury. Their redemption in gold has been a matter of accommodation on the part of the Treasury Department, as the law gives the Secretary of the Treasury the discretion as to whether they will be redeemed in gold or silver. Now that the gold balance is reduced the Secretary of the Treasury is considering the advisability of using his discretion and paying these notes in silver."

"If Carlisle determines to take advantage of the discretion given him it will be a more difficult matter for New York brokers to obtain gold certificates, and Treasury notes would leave them with less upon which gold could be obtained. There is a feeling among some men who have been prominent in financial circles, that, should Secretary Carlisle issue an order stopping this redemption, it would approach something of a sensation."

THE METALS—Silver has developed more firmness during the week. Copper is a little weaker. Tin is stronger. Lead shows no change.

William H. Brown, Angel's Camp, guide for stamp mills; Francisco Cavallaro, San Jose, beam and girder mill; J. J. Christensen, San Francisco, San Francisco, steering mechanism and mechanism for controlling ships' rudders; Arthur W. Coffin, San Francisco, pen and pencil holder; Edwin T. Earl, ventilator and combined ventilator and refrigerator car; Alfred T. Elford, San Francisco, ship's propeller; Michael Emme, Oakland, ground generator of electricity; Harry E. Fairman, Berkeley, water-carrying machine; William V. Gaffey, Castville, machine for cultivating sugar beets; Adolph Hintz, San Francisco, combined huller and sorer; Alexander J. McDonough, San Francisco, potato separating and grading machine; Benjamin D. McEachren, San Francisco, window hanger; David M. Miller, Fairfield, field or lawn mower; Lars Olsen, Oakland, steam roller; Mayflower Gravel M Co, California, water-carrying machine; Henry A. Shipp, Watsonville, fruit pitter; George Gates, Jackson, concentrating belt.
 Oregon—Mary E. Cook, Amity, railway car stove; Gustave A. Sachs, Eugene, breakdown, breach-loading gun.
 Washington—John E. Caterson, Dayton, car coupling; Clara T. Gott, Seattle, egg poacher.

NOTES.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible by mail for telegraphic order. American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s Scientific Press U. S. and Foreign Patent Agency, the following are worthy of special mention:

TWO-WHEELER VEHICLE.—John A. Bilz, Pleasanton, Alameda Co. No. 494,752. Dated April 4, 1893. This invention, though applicable to any two-wheeler vehicle, is especially intended for those having small wheels of any character, and particularly wheels having rubber tires, and such tires as are inflated and known as pneumatic tires which have given to racing vehicles the generally accepted term of "pneumatic sulkies." In this class of vehicles, on account of the small wheels, it is essential to obtain sufficient elevation of frame and seat; and, in effecting this, regard must be had to such a connection of axles, shafts and wheels as will give ample room for the movements of the horse, and will yield rigidity and strength consistent with lightness. To obtain these results is the object of the invention.

CHEESE-MAKING APPARATUS.—Wm. T. Armstrong, Lardo, Kern county. No. 494,973. Dated April 4, 1893. The invention relates to that class of cheese vats in which the chamber for the milk has underlying it a compartment for the water, to which heat from a suitable source is imparted. The invention consists, in connection with the milk chamber and underlying water compartment, of a novel heater for heating the water. The main object of the invention is to provide a simple apparatus or vat which may be used on as small a scale as may be desired, thus providing for its application to the uses and necessities of private families. The particular object of the invention is to provide the most simple means for heating the water, involving in its operation and use the greatest economy by reason of the conservation of all the heat, and permitting the temperature to be regulated with accuracy, thus placing within the hands of every one, skilled or unskilled, the means of making cheese in any quantities required.

CHILD'S CARRIAGE.—Eveline L. Campbell, S. F. No. 495,301. Dated April 11, 1893. This is one of that class of children's carriages in which the body of the vehicle is so constructed that it may be extended to provide sufficient length to serve as a cot in which the child may lie, and may be readily shortened again to serve as a carriage. The improved vehicle is of simple construction, and can be readily converted from a carriage to a cot, and vice versa.

BODY AND BED WARMER.—Mary A. Murphy, S. F. No. 495,427. Dated April 11, 1893. This invention relates to the class of devices commonly termed body or bed warmers and which consist of a heated vessel adapted to be placed in the bed to maintain warmth. The object of the invention is to provide a warmer, the shape of which adapts it not only to preserve its position

NOTICE OF ASSESSMENT.

GOULD AND CURRY SILVER MINING COMPANY.
 Location of principal place of business, San Francisco, California. Location of works, Virginia, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees, held on the 15th day of April, 1893, an assessment, (No. 7) of Twenty-five Cents (25c.) per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the Secretary, at the office of the Company, Room 63 Nevada Block, 303 Montgomery street, San Francisco, California.
 Any stock upon which this assessment shall remain unpaid on the 15th day of May, 1893, will be delinquent, and advertised for sale at public auction and unless payment is made before, will be sold on TUESDAY, the 6th day of June, 1893, to pay the delinquent assessment, together with the cost of advertising and expenses of sale.

By order of the Board of Trustees,
ALFRED D. DUBROW, Secretary
 Office—No. 69 Nevada Block, 303 Montgomery street, San Francisco, California.

DELINQUENT SALE NOTICE.

SUPERIOR MILL AND MINING COMPANY. LOCATION of principal place of business, San Francisco, California. Location of Works, Placerville, El Dorado County, California.

Notice—There are delinquent upon the following described stock, on account of Assessment (No. 1) levied on the 15th day of February, 1893, the several amounts set opposite the names of the respective shareholders, as follows:

FRUE ORE CONCENTRATOR

OVER 8200 IN ACTUAL USE.

Price of 4-foot wide Plain Belt Frue Vanner.....\$550, f. o. b.
 " " " Improved Belt Frue Vanner..... 800, f. o. b.
 " 6-foot " Plain Belt Frue Vanner..... 800, f. o. b.

Manufactured under Patents of April 27, 1880; September 18, 1883; July 24, 1888; and March 31, 1891.

GLADSTONE MINING COMPANY, C. J. Clark, M. E. Gen'l Supt. FRENCH GULCH, Calaveras Co., Cal., Dec 12, 1891.
 MESSRS. ADAMS & CARTER, San Francisco, Cal.—DEAR SIR: During my experience in mining and milling, I have used twenty-four of your four-foot Frue Vanners on different kinds of ore, both gold and silver. I have made competitive tests against them with other widely puffed-up concentrators and have always found the Frue in first place. When I built this mill (20 stamps), I determined to put in six-foot Frue in order to save space and machinery. I am now running four of your six-foot machines and they have been going for twelve months. They are taking the pulp from 20 stamps, crushing a minimum of fifty tons per day, and do better work than the four-foot tables. They require no more attention than a four-foot table and handle at least twice the quantity of ore. I have run them up to 80 tons per day and could not see that they were crowded. They stop and start as easily as the smaller tables and have the advantage of double capacity with the same bearings and wearing parts, requiring no more oil, and no more wear and tear than the smaller tables. My repair account for the past six months has been too small to mention. In order to give an idea of the work they are doing here I will state that the ore has varied monthly from \$5 to \$20 per ton and the tailings from nothing to 60 cts. per ton. I will conclude by saying that I cannot endorse the six foot Frue Vanner too highly, and it is the only table that I would have in my mill.
 C. J. CLARK, Gen'l Supt.

A Horizontal Refrigerating and Ice Machine.

The engraving on this page shows the horizontal refrigerating and ice machine shipped recently by the Vulcan Iron Works of this city to the Gambrius Brewing Co. of Portland, Oregon. It is of 35 tons capacity. It is what is known as a horizontal double-acting compressor and is driven by a Corliss engine, with latest improved valve gear. The valves of the compressor have some special features, making them very convenient to get at and also very durable, being all made of machinery steel. The machine is run on the minimum amount of clearance in the cylinders. The expansion of the piston rod is taken up by the cool circulation of oil through a chamber in the stuffing-box. There are no bolts used in the stuffing-box, which is a double one, being taken up with a screw cut around the circumference, thus insuring perfect alignment of both stuffing-boxes on the piston rods. The cylinder is water-jacketed, and all the working parts, pins, journals, etc., on both engine and compressor, are made entirely with genuine Babbitt metal, the bearings being extra large. The cross-head is of special design, most conveniently arranged for taking up the wear on the slide; the slides are fitted with genuine Babbitt metal.

The engine is an extra heavy one, suited to the severe character of its duty. All the pins on the engine have adjustable brasses, and the governor is a high-speed one, arranged with counter-balance so that the speed of the compressor can be reduced one-half. The fittings and valves on this machine and on the ammonia piping connected with the plant, are of the Vulcan Works design, and their character may be judged from the fact that when the plant started up the other day, with an air-pressure of 300 pounds, there was not a single leak anywhere. Neither were any of the bearings heated. The plant is now in successful operation at Portland, and is the first of its kind put in operation on the coast. While designed mainly as a refrigerating plant, part of its extra capacity will be utilized in making about four tons of ice a day. Different sizes of this same style of machine are made by the Vulcan Works. In this horizontal type there is no necessity of a platform as in a vertical machine, and the attendant does not have to climb to get at the valves, etc. The new design is particularly adapted for the larger sizes of refrigerating machinery. The Vulcan Works are making a specialty of refrigerating plants and ice machines and have been very successful in their work,

not only on our own coast, but in British Columbia and Central America. Breweries, canneries, packing companies, markets, etc., have been fitted out by them, and they have various designs suited to special requirements.

AFTER several years of inactivity, work is again to be resumed on the placer ground at Picacho, 30 miles north of Yuma. A company has lately been incorporated at Los Angeles called the California Picacho Mining Company, composed chiefly of English and California capitalists, who intend to put in an extensive plant at Picacho. About four miles of 12-inch pipe will be required to convey the water from the river to the gold-bearing ground.

The Gates Concentrating Belt.

George Gates of Jackson, Amador county, has just received through the MINING AND SCIENTIFIC PRESS Patent Agency a patent for an improved concentrating belt to be used on belt concentrators for saving sulphurets, etc. The object of concentrating belts is to provide a surface over which the pulp is allowed to flow, and upon which the heavier and more valuable portions will settle and be detained during this flow. The belt is usually mounted upon rollers at a slight inclination and is caused to travel up the incline toward the source of supply, so that the arrested particles are carried over the roller at the upper

end and are then washed off from the lower side of the belt, thus making the operation continuous. The belt is usually agitated in different ways to give it a shaking motion for the purpose of adding to its efficiency, these features being common to all concentrating belts. These belts are made of various materials; canvas and rough burlaps have been largely used, and also rubber belts with various forms of corrugations and pockets into which the concentrates are intended to settle and be retained. The objection to the canvas is that the constant action of the water soon renders it slippery and slimy and causes it to swell so that the surface does not hold concentrates and much is lost, in addition to which

the material soon becomes destroyed and must be replaced.

In the various forms of rubber belts the pockets or corrugations are made so deep that with the comparatively small quantity of sulphurets contained in any given stream of pulp, there will not be enough sulphurets to fill these corrugations, and consequently a considerable quantity of valueless sand will be retained and the separation of the sulphurets will not be as perfect as desirable. Mr. Gates in his invention employs a rubber belt which is formed with a closely pitted upper surface over which the material will pass.

The pitted portions are practically in series and have connecting necks and flanges which are produced by reason of the alternate arrangement of the pits and the depressed or pitted condition of the surface of the belt. This arrangement produces practically a series of fine channels through which the pulp passes and is claimed to be very effective. An improved form of edge flange for the belt is also covered by this patent and the inventor says this flange will not crack or break with long and continued use.

VULCAN HORIZONTAL REFRIGERATING AND ICE MACHINE, THIRTY-FIVE TONS CAPACITY.

The company expects to expend \$75,000 on its pump, pipe line and other necessary machinery.

JOHANNESBURG, in the Transvaal, South Africa, is a wonderful little town. It is but five years of age and the inhabitants number 40,000. It stands upon a gold reef, and upon this reef 50 companies are at work giving employment to 3370 white men and over 32,000 natives.

A NUMBER of Colorado capitalists have located a placer claim on "Old Baldy" mountain, San Bernardino county, 2000 feet below the peak. The operations will be on an extensive scale. A large pipe-line will be laid to carry water for hydraulic mining.

THE Klamath river miners are all busy at present putting in wing-dams, or making preparations to do so, and expect to have a very successful season this year in taking out great quantities of gold-dust.

THE Osceola Gravel Company, Nev., expect to employ about 100 men this season.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Vulcan Horizontal Refrigerating and Ice Machine, 257. The Proposed Union Depot and Ferry-House, San Francisco, 261.
EDITORIALS.—A Horizontal Refrigerating and Ice Machine; The Gates Concentrating Belt; Miscellaneous, 167. Foundry Notes, 253.
MISCELLANEOUS.—Industrial Notes, 259. Yellow Pine District, Nevada; Quartz Locations in Placer Claims; Calaveras County Marble, 260. The New Ferry House, Building a Water-Tight Masonry Dam, 261. The Asphalt of Trinidad; A Giant Redwood for the World's Fair; A Good Whitewash, 262.
MECHANICAL PROGRESS.—Lamination in Metal; The Ferris Wheel; Steel Barrels, Tin-Plated Yarn, 264.
SCIENTIFIC PROGRESS.—Fah's Earthquake Theory; Water in the Spheroidal State, 264.
USEFUL INFORMATION.—Mechanical Theory of the Corona; Oranges as a Medicine; Cholera—Its Cause and Prevention; Paper Car Wheels, 265.
ELECTRICITY.—The Electric Welding Process; Electrical Generators for Chemical Laboratories; Liquid Fuel, 266.
MINING SUMMARY.—From the Various Counties of California, Nevada and other Pacific States and Territories, 268-264.
MARKET REPORTS.—Eastern and Local Metal Markets; Coal and Coke; Sales in San Francisco Stock Board; Notices of Meetings; Assessments, Dividends, etc., 266.

Comment.

After Monday next, May 1st, the penalty clause of the Caminetti law comes into force. This provision is: "Any person or persons, company or corporation, their agents or employes, who shall mine by the hydraulic process directly or indirectly injuring the navigable rivers of the United States, in violation of the provisions of this Act, shall be guilty of a misdemeanor, and upon conviction thereof, shall be punished by a fine not exceeding \$5000, or by imprisonment not exceeding one year, or by both such fine and imprisonment, in the discretion of the court." Another section of the law provides that hydraulic mining, carried on in the territory drained by the Sacramento and San Joaquin river systems, other than as permitted under the provisions of the Act, is prohibited and declared unlawful. Miners will do well to bear these important provisions in mind, and not risk punishment by attempted violation of them. Some injustice is being done to the mining community by the delay in appointing the commission whose duty it is to issue licenses to mine under this Act. While the dispatches a month since announced the appointment of certain U. S. army engineers of this city, inquiry at their offices develops the fact that they have as yet received no official notification of their appointment. After such notification, they have 30 days to organize and an indefinite time to formulate plans. Hydraulic miners who have been in this city during the past two weeks to see about licenses find there is no one to whom they can apply. Therefore, though the penalty clause comes into effect in a few days, they can obtain no licenses to comply with the law. All they can do is to wait. The State Miners' Association foresaw this difficulty and tried to have the bill amended so as not to come into effect until the commission was appointed and ready to grant licenses, but this they were unable to accomplish. It would have been, however, simple justice. Now, no man can well comply with the law and continue to mine, unless he already has restraining works which keep everything but the water out of the streams. Several miners are ready to put up works, but are unwilling to do so without previous consultation with the Debris Commissioners. So far there are no Debris Commissioners, though there is a law to punish miners for not getting their permission to mine. We should not advise any miner to work any hydraulic claim not already provided with restraining works, without consulting his attorney, no matter how far his mine is from a navigable stream. Even where he thinks he is doing no damage, anti-debris people might think differently and get him into trouble.

The Trans-Mississippi Congress is in session at Ogden this week. Up to Thursday, most of the time had been occupied on the silver question, and a resolution adopted

asking the directors of the World's Fair to set apart a day in September to be known as Silver Day, when addresses on the subject of silver coinage can be delivered and the day otherwise be celebrated in an appropriate manner. The delegation from this State went with a simple and definite policy. The Nicaragua canal, the improvement of the San Joaquin and Sacramento rivers, deep-water harbors for Los Angeles and San Diego, and a fair appropriation to carry out the hydraulic mining law are the only demands, and on these all were agreed. Mr. H. Weinstock of Sacramento is chairman of the delegation and Julian Sontag, secretary. Mr. Sontag was subsequently elected secretary of the Congress. He is one of the two delegates sent by the California Miners' Association. There is little doubt that the Congress will agree to all the propositions to be introduced by the Californians.

Since writing the above we have received a dispatch (Thursday) stating that the Congress adopted unanimously the California resolutions recommending Congress to make an appropriation toward building dams to hold back mining debris.

THE Union Iron Works people ought to feel proud of the many compliments paid to the cruiser San Francisco while participating in the naval display at Hampton Roads with vessels from all nations. The vessel is of American design and was built in this city by California mechanics. In going from here to New York, on the first 13 days of the home run the San Francisco burned 107 tons of coal less than the Baltimore and 45 tons less than the Charleston. This proportion was maintained to Hampton Roads, where the official record of the trip shows the San Francisco burned \$10,000 worth less coal than the Baltimore and much less than the Charleston. The San Francisco needed no repairs; the Charleston needed some new boiler tubes; the Baltimore was sent to the Brooklyn Navy Yard for general repairs. Admiral Hopkins, of the British fleet, pronounces the San Francisco the finest vessel in the fleet, not only in her appearance but in her armament, finish and the personnel of her officers and crew. The same gentleman, by the way, says the silver service presented to the ship by the citizens of San Francisco the most magnificent he had ever seen. This, too, is of California manufacture, having been designed and made here by Geo. C. Shreve & Co. The crew of the San Francisco have covered themselves with glory in the boat races by winning every one they entered, beating the sailors of the combined fleet. The boats had something to do with this, which is a compliment to our Navy Yard at Mare Island, where they were built. Martin Vice, of this city, was foreman of the Mare Island boat shop when the boats were built. The San Francisco has attracted so much favorable attention since she went East that she has proved a good advertisement for the city after which she is named and for the mechanics who constructed her.

San Francisco is not in these days easily excited by a mining discovery, but because, in excavating a lot at the corner of Devisadero and McAllister streets, a man found some cinnabar ore, several thousand people have thronged around the spot to look at the "city mine," and the daily papers have been filled with detailed descriptions of the find. Some of the ore is said to be very rich and to carry a high percentage of metal, but nothing is yet known of the extent of the deposit, since only a 12-foot "shaft" has been sunk. Cinnabar ore has been found in several places before this on this peninsula, but nothing ever came of the mines. It was found on the Potrero years ago. Prof. Whitney, in his State Geological Survey Reports, mentions the discovery of small quantities of cinnabar ore and mercury in early days near the Mission, in the serpentine rocks. In fact, small irregular deposits have been found near Berkeley, at Point Reyes, and in Santa Clara, Napa, Sonoma, Lake, Colusa, Yolo, Fresno, Santa Barbara, San Luis Obispo, San Benito, Marin, Solano and Trinity counties. A very small proportion of the deposits found ever proved to be of any value. In 1874 and 1875, when quicksilver was very high, production was stimulated and many deposits discovered. None of those found grew richer in depth. If this deposit had been struck outside of the city, little attention would have been paid to it unless development proved it of some value. But, being within city limits, and widely advertised as something remarkable, the importance of the find has been magnified. At the same time, there is nothing strange about it, for the serpentine rocks in which the metal occurs run through the peninsula, and, as stated, similar finds have been made here before.

SMELTING WORKS are to be put up at Marietta, Nev., for the accommodation of the silver-lead mines of the district.

THE Kennedy quartz mine, Amador county, cleaned up \$65,000 last month.

Improvement in Comstock Mill Returns.

We have repeatedly claimed in our columns that the ores produced by the mines located on the Comstock were either carelessly worked, or, that the mills converted to their own use the bullion produced, which should have gone to the mining company whose property yielded the ore. The Mining Stock Association has made a persistent fight to compel the mills to return to the ore-producing companies the proper percentage, and the result of the agitation of the matter by them and others is shown by the results of the working of the Consolidated California and Virginia and Potosi ores for the month of March, 1893. During the month of March the Consolidated California and Virginia sent to the mills of the Comstock Mill Company 3625 tons of ore. The average car sample of this ore was \$30 46 per ton, and the average battery sample \$27 43, showing a difference of but \$3 03, or ten per cent. The bullion returns for the month are 2463 tons, for which there was returned, gross bullion, \$59,062, or \$23 98 per ton. This is 73.72 per cent of the car sample value, and 87.42 per cent of the battery sample value. These percentages have not been equalled on ore from the Consolidated California and Virginia since Senator J. P. Jones had the contract to crush the output of this mine. At that time he was crushing the ore under a contract with Messrs. Mackay and Flood, the latter having no interest in the mills. They compelled Jones to give them a railroad car sample assay, a mine sample assay, and a pulp or battery assay. The numerous checks on the mill resulted in returns up to 95 per cent of the battery sample value. When the Comstock Mill Company was formed, and Flood and Mackay became part owners in the mills, this was changed, and the returns to the company were much less than under the Jones contract. Under the Jones contract the Consolidated California and Virginia received the proper returns from the mills. Under the Comstock Milling Company's work the ore was systematically looted, and the bullion appropriated, as shown in the evidence in the Hale & Norcross suit.

The returns from the Potosi Company for the month of March are a trifle better than those from the Consolidated California. This company sent to the Nevada Mill 2258 750-2000 tons of ore during the month. The average car samples of this was \$27 67 per ton and the average battery sample value \$24 77, showing a difference of but \$2.90 per ton, or a trifle over ten per cent. The bullion returns for the month are on 1888 tons, for which there was returned gross bullion \$41,300 98. This is 79 per cent of the car sample value and 88.3 per cent of the battery sample value.

The Consolidated California and Virginia reports a profit of \$9000 for the month of March. When it is considered that out of this amount about \$4000 is represented by the check which the Comstock Milling Company returned to the mining company, because they had not returned the proper per cent of the ore crushed, the effect of the agitation for honest milling can be appreciated. It is to be hoped that this is the dawn of a new era on the Comstock. There is no reason why that country should not be prosperous. There is plenty of ore which will pay for crushing but it must pay the shareholders in the mines not the shareholders in the mills. The greatest good to the greatest number would be carried out in this way and instead of a finely pampered and dissipated millionaire millowner we would have hundreds of comfortable citizens with homes of their own. We hope that the much needed reform in the management of the Comstock has commenced, but we know that an atmosphere that will absorb bullion is very demoralizing, and there is no telling whether the change is permanent or not. However, the bullion record never lies and if the millowners have not reformed that record will soon tell the story. It is worthy of remark that the mill that returned 78 per cent to the Potosi Company is the same one that could save only 30 per cent for the Hale & Norcross.

F. MAHLER, a machinist by trade, 276 Minna street, showed us last week an unbroken steel shaving nearly sixty feet long, half an inch wide and about a hundredth of an inch in thickness. It was cut while turning a crank pin in 1891. It is of the finest quality of steel and must also have been a good lathe hand who made the shaving. It is rolled in a small coil to be exhibited at Chicago.

THE designer and architect of the new ferry building at the foot of Market street, which is illustrated on page 261, is A. Page Brown, to whom we are indebted for the photograph from which the cut is made.

WHILE southern Esmeralda (Nev.) silver camps send out gloomy reports, Pine Grove, in northern Esmeralda, with its gold ledges, is looking up.

Foundry Notes.

THE action of the Canadian Government with relation to the admission of mining machinery into British Columbia is not looked upon with favor by American mining machinery manufacturers, or, for that matter, by British Columbia miners. It has been evident from the time the law making mining machinery free was first enacted, and made to contain the clause "if not manufactured in Canada," that the benefit it would be to the miners of the country would depend altogether upon the manner in which it should be administered. The Quebec Mining Association, at a meeting recently held at Montreal, received a report from a committee appointed to interview the Controller of Customs. The law provided that the oath of the importer should be sufficient evidence as to whether any machine was manufactured in Canada or not, but in practice it was found that the customs officers pleased themselves whether the oath should be accepted or not. This Department had even provided itself with a list of machinery drawn up by the head of an interested manufacturing firm, all of which, it was alleged, was manufactured in Canada, and included in the list was every machine from a "jig" to the most elaborate modern and costly crushing or drilling machine. The company did not by any means make every class and kind of machinery in existence or that might be required, and some which they did claim to make took a whole year to manufacture, and after waiting that length of time the purchaser was made to pay, in addition to the American price of the machine, the full amount of the duty, which would sometimes be \$800—the American price and the duty being the Canadian price of the machine.

The law enacted three years ago had the earnest support of the members of Parliament from British Columbia. And when it was renewed and extended for another period of three years at the late session, Mr. Barnard advocated the free admission of all machinery used in mining. This should have prevailed, but the Eastern manufacturers were too powerful with the Government, and would not permit it. A good deal of the machinery wanted by miners in British Columbia cannot be furnished by Canadian firms, because they are made under patents owned by American manufacturing firms. The Canadian firms can make the old machines, on which patents have run out, and which have been superseded by later and better inventions, but the miners do not want them and ought not to be compelled to use them or suffer by paying a high duty on the better imported article. The present condition of affairs is bad for the British Columbia miners, especially as that region is being rapidly developed, and new plants are being ordered and built. San Francisco foundrymen are interested in the matter to some extent, as machinery can be shipped from here readily, and more would be ordered were the revenue laws more favorable.

THE Joshua Hendy Machine Works report an increasing demand for hydraulic nozzles for gravel mining. About a dozen orders sent in recently are for plants in northern California, Idaho, Colorado and Arizona. No special demand is noted from the older hydraulic mining regions of California which dump into the tributaries of the Sacramento or San Joaquin. In those older sections the claims which can operate are already equipped, but most of the mines are closed down and will remain so until the Government Commission is ready to issue licenses to mine by the hydraulic process.

THE Champion Mining Company has purchased a new pumping and hoisting plant from the Union Iron Works of this city and the machinery will shortly be shipped to Nevada City. It will be one of the heaviest plants of its kind in Nevada county. Wm. May of Grass Valley will have charge of the business of erecting the new works and the preparations for receiving the new and elegant machinery have already been commenced. The machinery to be placed on the mine will be able to work to the depth of 3000 feet. The Champion is looking well and fully justifies the management in making the large outlay in the new improvements.

THE City Trustees of Oceanside have located a diverting point upon the San Luis Rey river near Pala, twenty miles from Oceanside, and will commence diverting the water at once. Lew Harris is the engineer in charge. The city recently voted \$30,000 in bonds, and with this and subscription from the English syndicate at Montserrat water is to be secured for the city and intermediate lands. This is another big job for makers of iron pipe. There is great competition, however, in this line. In the case of the new Vallejo Water Works bids were offered for lap-welded pipe at lower prices than the engineers' estimates of ordinary pipe.

A NEW gas-holder for the new gas works at North Beach has just been completed by the Union Iron Works. It has been tested and proved to be very satisfactory. It is one of the largest on this coast and is capable of containing 2,000,000 cubic feet of gas. The circumference is over 500 feet and in height 180 feet. The basin in which it was constructed is 40 feet deep and is capable of containing 5,000,000 gallons of water.

Now that the suit of Bateman Brothers against the Harbor Commissioners has been decided adversely to the plaintiffs, there will be no further delay in commencing the work of construction of the ferry building at the foot of Market street. The foundations are to be somewhat modified, that is to say, the piles will be cut off at 21 feet 6 inches below city base, instead of 25 feet 6 inches as originally intended. This will be a saving in concrete and will reduce the cost of the foundations. Whether these footings or piers for the entire structures will be built now or at a later date will depend much upon the estimates. A drawing of this building is shown on another page. The structure is to cost \$600,000 aside from the expense of the foundations.

Coast Industrial Notes.

AT Lime Point the ground has just been broken for the concrete mountings of two twelve-inch guns.

TRACK-LAYING on the new Mission-street electric line in this city has been completed to 29th street.

A SMALL monument of black marble from a quarry in the South Yuba river, is to be shipped to the World's Fair.

THE Santa Fe, Prescott and Phoenix railroad is completed, and the first train ran over the road from Phoenix, A. T., on Monday.

TO SECURE 200 bonds of \$1,000 each the Highland Park and Fruitvale railroad, Alameda county, has executed a mortgage on its plant, franchise, etc.

THE bonds issued by San Joaquin county to provide money for the erection of the fine new County Hospital have been sold for \$51,000, which was at \$1000 premium.

SEVERAL COMBINATION CABLE CARS, of the same pattern as those recently placed on the Geary-street road, have been added to the rolling stock of the Valencia-street line.

SAN ANDREAS, in Calaveras county, is to have a fire-proof brick, stone and iron Hall of Records. William Mosser of this city is the architect, and the cost will be about \$15,000.

OF the \$125,000 bonus promised the Metropolitan electric road by property-owners, to secure the extension of the line through lands south of the park to the ocean, \$50,000 is reported pledged.

THE Board of Improvements at Mare Island Navy Yard is making an exhaustive research. Their report to the Secretary of the Navy will be a voluminous one, embodying all the details and possibilities to make the yard worthy of the coast and nation.

DEPUTY LABOR COMMISSIONER O'BRIEN, who for several weeks has been trying to ascertain whether the sweating system exists in the factories of this city, finished his labors on Saturday and reported to his chief that there are no sweaters in this city outside of Chinatown.

THE big blockade on the South Pacific Coast road, caused by the landslide at the tunnel near Wright's, has been raised and the road is now in operation all the way to Santa Cruz. The summer-tours schedule has been put into effect, including Sunday excursion trains to Santa Cruz.

OAKLAND is to have a co-operation of hackmen. The electric roads with terminals at nearly every depot and stopping place in the city, have cut into the hackmen's business to such an extent that some movement is necessary for their self-preservation. They say business is not paying while expenses go on as usual.

THE contracts for a city hall, four miles of water mains and a complete fire alarm system have been signed by the city trustees of Hanford, Tulare county, and work on these improvements will commence at once. The improvements will cost \$30,000, bonds for which have been sold. The town has also a \$60,000 opera house which was formally opened on Monday night.

THE Truckee Republican says that the work of cutting ties for the new railroad to Lake Tahoe has already commenced, and in a few days the woods will be full of workmen. The snow is too deep yet to commence taking up the track of the Burckhalter railroad, preparatory to transferring it to the line of the Donner & Tahoe line, but all the preliminaries are being made.

THE Colorado Fuel and Iron Company's iron mines at Newcastle, Colo., are on fire, and the prospects are that it will take at least two months to extinguish the flames. The fire is supposed to have been caused by the ignition of gas. Nobody was injured, but the loss to the mines will be heavy. They are the largest in the West. A large number of men are out of employment.

THE Oregon Pacific Railroad Company will attempt to foster a new industry, the bringing of fir firewood to San Francisco for a market. The corporation finds that it can transport the wood at a very small cost, and as there is a large demand for fuel of that nature here, the company's steamer Willamette Valley will bring down with her this trip several hundred cords as an experiment.

EUREKA PARTIES are preparing to put a proposition before the Oregon Pacific for the extension of a line to Humboldt to connect with the proposed coast road to San Francisco. As a consequence of active competition in Oregon for the business of Willamette Valley, the Oregon Pacific people are bringing an unusual amount of wheat to San Francisco; 620 tons will come by the company's next steamer.

W. G. CURTIS, Assistant General Manager of the Southern Pacific Company, says that the company intend to remove its division shops from Terrace to Ogden, and put up new shops at the latter place that will give employment to over 200 men. The buildings for the shops and round-houses are to cost \$60,000, and the people of Ogden have raised \$20,000 as an inducement to the company to put the shops there.

HARBOR COMMISSIONERS BASSETT, COLE AND BROWN, accompanied by Chief Engineer Holmes, made an inspection last Thursday of the various methods of pile protection used in the harbor. At Tiburon piles prepared by the Paraffine Paint Co.'s process from five to eight years ago were found in a splendid state of preservation, while uncoated piles driven less than a year ago were entirely eaten away. The same was found true at Angel island and other points visited.

A TELEGRAM just from San Luis Obispo states that the Pacific Coast railroad will be at once pushed on from its present terminus at Los Olivos to Santa Ynez, four miles further south. It is generally believed that the road will soon be incorporated as a part of the Southern Pacific system, and this order would seem to indicate that the much-mooted question of the exact route to be taken by the latter road through northern Santa Barbara is by Santa Ynez

and Gaviota pass instead of by way of Lompoc, as has been generally supposed.

THE pressing need of a dredger and steam tug is continually felt at the Mars Island Navy Yard. An appropriation of \$20,000 has been made, which will become available after July, for dredging along the water front. There is some talk of pumping the mud up and depositing it on the tules between the sawmill and where the Independence is lying, so that some day the place may be filled in and a line of quay wall be built for this purpose of having additional room for ships to lie alongside.

THE new works of the San Francisco Gas Light Company, situated at the corner of Bay and Buchanan streets, are rapidly nearing completion. A large force of laborers and mechanics are engaged in placing the machinery in order and in finishing the few outbuildings. The new gasholder is the largest on the coast, being 180 feet high and 500 feet in circumference. The retort, generator, exhaustor, purifying, office, meter and scrubber buildings are almost completed and fitted up with all the modern equipments necessary for conducting such an extensive gas works as this one is.

ARTICLES of incorporation of the Plungs Creek Water Company have been filed with the County Clerk of San Bernardino county. The incorporators are: H. J. Waters, A. E. Sterling, E. G. Judson, James G. Clark, F. G. Brown and others. The amount of capital stock is \$100,000 all of which has actually been subscribed. The principal place of business is Redlands, California. The object of the corporation is to buy and sell water for the irrigation of a large tract of land in Highland, near the city, and to develop power for electric lighting and manufacturing purposes. The stockholders are well known as the founders of the Bear Valley irrigating system, and the new company proposes to push developments at once.

JUDGE M. P. O'CONNOR has transferred his magnificent mansion at the corner of Second and Resed streets, San Jose, to the sisters of the Notre Dame College for a technical school. The transfer was made several weeks ago, and the sisters will take possession of the mansion in about two months. There were no terms accompanying the donation, except that it should be used for the caring of orphans, and poor and destitute children. Sisters from the Convent of Notre Dame will manage this new institution. All children who are raised by the Catholic societies will be placed in this school, and they will be given a good education. They will also be taught to cook and sew and do other household work.

THE Russian Finns, who constitute over one-third of the fishermen of Astoria, Or., are talking of forming a second fishermen's union in opposition to the one at present in existence, which is composed mainly of Scandinavians. The former, if they combine, will work under the rate of \$1.15 per fish. Up to this present the salmon catch has been very slack, and 40 per cent of the fish captured are of poor color and average about twenty-one pounds in weight. Up to the present time the five cents per pound now being paid by the canners has worked against the men, as all packages of fish has been under weight. However, the runs of the latter part of May and June will no doubt bring far larger fish. Some of the cannerymen are holding off until that time, when they will crowd into the spaces of seven weeks all the work the capacity of their places can possibly handle.

THE San Francisco and San Mateo Railroad Company secured an injunction on Monday to prevent any interference with its plant pending the final determination of the replevin suit filed last week by the Thompson-Houston Electric Company. Had it not been for the injunction, it was the intention of the electric company to have seized all the machinery, cars, dynamos, etc., of the railroad because of alleged non-payment of a part of the purchase price. The railroad company admits the existence of this debt, but charges that the money is owing from the S. S. Construction Company, by which latter corporation the road was built. The railroad alleges that, aside from its bonded indebtedness, it owes only \$32,000; also that the road is in a flourishing condition, its earnings now averaging more than expenses and interest on the bonds, and are constantly increasing.

THE work of building an electric railroad from Mayfield to the Stanford University will begin in about three weeks. The storage-battery system is to be applied on this line. The owners of the franchise are Messrs. J. M. Louks and C. F. Hayne. The name of the corporation is the Mayfield and Stanford University Electric Railroad. The route is from the Southern Pacific depot at Mayfield up Lincoln street to Yala street in College Terrace, thence through Palo Alto avenue to Bowdoin street, thence to Mayfield thoroughfare to a point opposite to the quadrangle of the classrooms. This is as near as Senator Stanford will permit any company to approach the university. He has announced his purpose to lay a track from the quadrangle to the Mayfield thoroughfare, a distance of about a quarter of a mile. The company will be permitted to run their cars over this track to this quadrangle. The new electric road is built for the accommodation of those students who reside in Mayfield and College Terrace, and those who desire to reach the former point to take the cars either for San Jose or San Francisco.

THE motemen and conductors of the various electric lines of Oakland and vicinity are about to organize a union. The roads have spread out so extensively in the past few years and the town has grown so rapidly along the lines that many cars are necessary, and perforce, many men are needed to operate them. For instance, the Oakland Consolidated road, with its 23 miles of track, operates 24 cars, and employs 100 men; the Telegraph Avenue line has 11 miles of track, runs 15 cars and employs 75 men; the Consolidated Piedmont, 4 miles of track, runs 5 cars, and employs 25 men; the Oakland, San Leandro and Hayward road has 20 miles of track, runs 12 cars, and employs 60 men, and the Vandercook Sessions line has 8 miles of road, runs 8 cars, and has 40 men. Here are over 300 men employed as conductors and motemen, and they feel that an organization among themselves would be to

their advantage in many ways. Each car has two shifts of men, or four to a car, the day men working 11 hours and the night shift 7, with wages 21 cents per hour. This is the case on all the roads except the Telegraph Avenue line, where the men receive 22 cents per hour, but their hours of work are so arranged that the wages aggregate about the same as on the other lines.

KNIGHT & Co. of Sutter Creek are making a big rock-breaker for the county for road-making purposes. The piece of machinery consists of an ordinary rock-breaker, mounted on a heavy truck with four wheels. The breaker is fed by elevators from both sides, and the broken rock is discharged into another elevator which carries it up and dumps it into carts or wagons without handling; or, if it is to be dropped on the road where it is broken, it is separated into three grades, the coarsest falling first, a finer grade falling on top of that and the finest coming out last. The power is furnished by a gasoline engine which, with a water tank, is carried upon the trucks. The power of the engine is conveyed to the rock-breaker, the elevators and the truck at the same time; thus, as the rock at the side of the road is put in the elevators and crushed the forward movement of the entire machine distributes it regularly over the surface of the road. Its use in this manner necessitates the placing of rock not to exceed ten or twelve inches along the side of the road, where they can be fed into the elevators without loss of time.

A BIG LUMBER YARD enterprise is to be started in San Francisco within a few months. It will be a lumber yard on a colossal scale, such as San Francisco has never seen before and will have an appreciable influence in regulating the price of lumber in San Francisco and vicinity. John Polson, the famous lumber king of the northwest, has been in town for some time past until a few nights ago, when he left for Portland after accomplishing his mission. The nature of the business that brought him to San Francisco has now been learned. Mr. Polson is a member of the firm of Inman, Polson & Co., of Portland, Or., which practically controls the lumber market of the Pacific Northwest. The firm not only has extensive lumber yards there but is interested in a number of large sawmills. The firm now proposes to make San Francisco a market for the output of its mills and Mr. Polson has been negotiating with James G. Fair for a lease of a large section of land at Harbor View. The site selected has a deep-water frontage and it is understood that Senator Fair will have a wharf built out into the bay at which the lumber-laden vessels from the north can dock and discharge their cargoes. This is not the only scheme which the big lumber kings have in prospect. They intend to open another large yard on the Oakland side of the bay and have something to say about furnishing the Oakland market with lumber.

Quartz Locations in Placer Claims.

The Butte (Mont.) *Inter-Mountain* says:

The quartz vs. placer lawsuit which was on trial in Judge McHatton's court this week came to an abrupt termination yesterday, the court deciding in favor of the plaintiffs in the case. Any decision in this character of lawsuit is of more than ordinary interest in Butte, as many controversies between quartz and placer titles are pending in the court. This was an action brought by the plaintiffs to quiet their title to the South Star lode.

In this case the plaintiffs were N. J. McConnell et al. and the defendants John Noyes et al. The plaintiffs claimed under a location of the South Star lode made December 2, 1878, the ground in controversy. Defendants claimed it under a placer location made prior to that date, upon which application for patent was made December 17, 1878. A placer patent issued in 1880. Plaintiffs introduced evidence to prove a discovery of a lode or lead, containing precious metals within the South Star boundaries, at the time of its location; and to prove their compliance with the United States statutes by marking the boundaries on the ground so that they could be readily traced, and by filing for record with the recorder of the proper county the notice of location in accordance with law; also to prove that they and their predecessors in interest had been in possession and engaged in working and developing the claim. After this they rested their case.

Thereupon the defendants offered in evidence the notice of location of their placer claim and contended it was admissible in evidence to prove that the location of their placer claim was made prior to the quartz location, by the plaintiffs; and that their placer claim was an existing claim at the time of the alleged quartz location of the South Star; and that this being true there was a grant by the government to them of the ground in question; and that if the same did contain a quartz lode the plaintiffs nor any one else could make a valid location of the same until the defendants had made their application for the placer patent and had failed to include in said application an application for the quartz lode. The plaintiffs objected to this.

The court held that a location of a placer claim operated only as a grant of placer ground, and that anybody had a right to go upon the placer ground and make a valid location of any quartz lead or lode found within the boundaries of the placer claim not claimed or possessed under the law by the owners of the placer location or any other person.

The defendants then offered in evidence their application for placer patent, and the patent itself, which were objected to, and the objection was sustained by the court which held: The question to be determined in this suit, was whether or not the plaintiffs had discovered a lead or lode, within the ground on or before the second day of December, 1878, and had made a location thereof in accordance with the requirements of law; and that if they had, that it operated as a grant by the government to them of the ground within their location and was excepted out of the placer patent. The application for the patent and patent itself, being subsequent in date to the plaintiff's location, were entirely irrelevant and immaterial and did not tend in any manner to disprove the quartz location by the plaintiffs. The

court further held that the evidence in a case of this character must be directed to disprove the quartz location. The defendants made several offers to prove, in line with their former offers, which were ruled out. The jury was directed to return special findings in favor of the plaintiff.

Yellow Pine District, Nevada.

A Virginia *Chronicle* reporter had an interview with J. V. Keeley of San Francisco, who was paying a short visit to Comstock friends. Mr. Keeley was formerly local agent of Wells, Fargo & Co., at Pioche, and was also located at Eureka, this State. He is interested in mining property in Yellow Pine, which is located in the extreme southern end of Lincoln county, Nevada. Mr. Keeley has but recently returned from a trip to that locality, and is imbued with the belief that Yellow Pine in the near future will astonish the world, as it abounds in rich minerals, principally gold.

Yellow Pine district is six miles east of San Bernardino county, the altitude above the sea level being 4900 feet. The gold belt covers an area of twenty miles, while minerals are found in large quantities within a radius of 100 miles. The gold belt is surrounded by mountains of galena ore, averaging from 2 to 60 ounces silver, and 80 per cent galena. There is a timber belt within twelve miles on Potosi mountain and numerous living springs of water. There are several good mines being worked in the district, and hundreds of locations already made. The country rock is lime, the capping on the surface generally ranging from two to ten feet deep. The gangue of the ores of the gold claims is generally found in red oxide of iron, interspersed with copper, a very favorable indication of permanency. The ore is free milling.

The principal mine of Yellow Pine, the only one being worked at present, is the Keystone, six miles east of Good Springs. Ten men are employed. A shaft has been sunk 110 feet, and a tunnel run 150 feet. In the face of the tunnel the ledge is 2½ feet wide, the ore from which assays from \$23 to \$30 in gold. The owners of the Keystone recently shipped 75 tons of ore to Pueblo, Col., for reduction, which netted them \$35, all gold, the assays ranging from \$446 to \$3195 per ton.

Another mine of merit is the Clementina, owned by Mr. Keeley. Six assays of ore, red oxide of iron, averaged \$323.42 in gold—the small percentage of silver not being counted. The mineral is flour gold, and easily horned, the ore being so crumbly that it can be pulverized between the finger and thumb. The great trouble in working the ore might be in saving the fine gold, which runs off, but the oxide of iron forming a natural flux a high percentage of the mineral can be saved. Omaha parties have offered to mill the ore on as liberal terms as offered in San Francisco.

The Boss mine, four miles west of the Keystone, one of the best developed in the district, has been bonded by S. T. Godbie Jr. of Pioche and Mr. Keeley. A shaft has been sunk 45 feet, one tunnel run 110 feet and three others from 10 to 60 feet, showing red oxide of iron and copper. The ledges blend 5 feet copper and 5 feet gold. The copper averages 14 per cent, silver 6 ounces, gold 1¼. They have in sight and on the dumps 1500 tons. A mill test of two tons of the gold and copper ore worked up to 80 per cent. The ledge can be traced from 1200 to 1300 feet on the surface.

The drawback to development of Yellow Pine district is the lack of railroad facilities. A Denver corporation is now engaged in running the Nevada Southern railroad from Blake (formerly Goff's) on the Atlantic Pacific to Vanderbilt, in San Bernardino county, thirty-five miles. A branch road seven miles in length will be run south from the main line to New York district, twenty-eight miles from Blake. When the road is completed to Vanderbilt it will run to Good Springs, forty-five miles, the center of Yellow Pine, and may connect with the Denver and Rio Grande at Salina, Utah. But the main point is to run to Iron City, Utah, to tap the magnetic iron mountain there, the largest iron deposit in the United States, and also to reach the coal fields at Kanarra, Utah. Twenty-six miles of the road from the road from Blake has already been built—within nine miles of Vanderbilt.

The company building the Nevada Southern from Blake is interested exclusively in a series of mines in New York district, where it has eighty men employed. The ore is low grade silver and when the branch road is finished to that locality the ore will be shipped to the company's reduction works at Needles, where it can be worked at a profit.

The gangue of the ore found in Vanderbilt district is granite and gneiss. The ore is sulphuret, the veins being continuous from the surface down. The ore from the mines owned by the Bonanza firm averages \$45 per ton in gold.

When the railroad shall have penetrated Yellow Pine district mills for the reduction of the ore will be built on the San Bernardino desert, which is only 1800 feet above the sea level. In a descent of ten miles from Yellow Pine there is a drop of 3100 feet. Wells will be sunk on the desert, where water is obtainable from three to twelve feet below the surface.

Mr. Keeley is confident of the future prosperity of Yellow Pine. He says there are base ores enough in the district to run a large number of smelters for ten years. The climate is not enticing. The temperature ranges from 90 degrees in January to 110 in summer. Vegetation is scarce—nothing grows there but cactus and tule-palm (commonly called "Joshua"), which is used for fuel, and rattlers are thicker than gophers in Mason Valley. But whoever heard of anything deterring the hardy prospector in search of gold.

GLUCINUM.—Dr. John Gibson in a paper read before the Chemical Society, states that of the many methods proposed for the preparation of glucina from beryl, only a few give satisfactory results, and none of them can be applied easily on a large scale. The percentage of glucinum in beryl is small, and it is therefore necessary to work up large quantities of this very hard mineral in

order to obtain a stock of glucina sufficient for the purposes of investigation. Hitherto it has been found necessary to grind the mineral to a very fine powder as a preliminary to its complete decomposition by the usual agents employed in the case of refractory silicates. The present communication gives an account of a method by which a kilogramme or more of beryl may be worked up at a time in an easy manner, and without being ground to a fine powder, the whole of the glucina contained in the beryl being obtained very quickly in a nearly pure condition, and, in particular, nearly free from alumina and oxide of iron. The method is based on the different behaviour of the fluorides of aluminium, iron, and glucinum when heated together, it being found that if coarsely ground beryl be heated in an iron vessel with six parts of ammonium hydrogen fluoride, the mineral is completely decomposed at a temperature below a red heat, the soluble aluminium fluoride at first formed being rendered insoluble in water if the heating be sufficiently prolonged, while the bulk of the fluorides of iron are decomposed and converted into ferric oxide, the glucinum fluoride remaining soluble in water. A new method for the perfect removal of the last traces of iron from the crude glucina is also described, based on the observation that in the presence in solution of a large excess of a lead or mercuric salt the precipitation of the lead or mercury as sulphide by ammonium sulphide effects by mass action the complete precipitation of the iron.

The Profits of Street Railroads.

Because the Market-street system and the Sutter-street cable lines pay handsomely, some of the San Francisco daily papers think that all street-car lines are most profitable concerns. The fact, however, is the reverse. The Ferries and Cliff (Jackson and Powell-street) lines have never paid a cent of dividends. This system could have done so before this, but that its lines run through districts of the city, westward, where street improvements of the most expensive nature have for three years been continuous. Bituminous rock pavement has been laid for miles along the streets through which that road's lines run. It is, like all other roads, required to do all street work between and for two feet on each side of its tracks. It has spent \$150,000 for street work within three years. Owners on the line of this road have thus had their street assessments that much lightened, besides the addition of cheap and rapid travel. Meantime, the stockholders have not made a cent of profit, while lots out by and beyond Central avenue have gone up 300 to 500 per cent, chiefly through the rapid and cheap communication the road afforded. For these advantages owners not only did not pay a cent of subsidy, but in some cases even made the company grade the whole of the unopened streets at its own expense. One very large owner, too, asked \$30,000 for a lot he thought the company must have, but it secured the lot just opposite, of nearly the same size, for \$1000. The Union-street line is paying no dividends, but has just expended \$180,000 in extensions. The Geary-street line is paying a dividend occasionally only. The Omnibus is paying nothing, and the electric road has, of course, paid no profit. Yet no city in the world has, since the transfer system was inaugurated between the cable lines, such cheap and perfect transportation as San Francisco. Vacant lot owners, speculating in values which they never created, and intent only on doubling up prices on buyers, keep urging further road extensions and still cheaper riding from street-car companies, who, without pay or subsidy has given to their land the value it now has. These owners purposely ignore the fact that capital does not build roads for amusement, but for profit, and that until they have earned at least a small profit they can neither reduce fares or make further extensions.

Calaveras County Marble.

Calaveras county comes to the front again with an industry that will in time outdo anything in the State. This time it is a solid mountain of marble. We have examined polished specimens taken from the Caldwell Consolidated Marble mine, which is owned by Messrs. Caldwell, Borger, French and Longley of Valley Spring, and is located about six miles from Valley Spring, midway between San Andreas and Valley Spring, and within one mile of the line of survey of our narrow-gauge railroad. The location of the mine is elevated above the railroad sufficient to transport marble by tram-way to the railroad. At present, products of the mine can be delivered on board of the cars for \$200 per ton.

We have on exhibition in our office, polished samples of this marble, and invite inspection of same. Many varieties can be found, but what predominates is the dark or mottled variety, suitable for building purposes. Slabs of any size or length can be procured without a fracture, and entirely free and clear of any mineral deposit.

In our opinion our county fathers should investigate this quarry with a view of putting in trimmings at least, if not a front, of this material in our new Hall of Records. Arrangements can be made with the owners of the quarry that would be satisfactory. We believe in fostering such enterprises, when they will bear investigation, and where there is a show to develop an industry that would be highly beneficial to the entire county.

E. J. Caldwell has been earnestly engaged in opening this property for the past year, and to his energy is due the ultimate success we expect to see made by the present company. Large blocks have been sent to the marble firm of Dixon & Woodhull of Stockton, and to the San Jose Marble Co., and after working them, the marble was pronounced to be of a superior quality, which is sufficient guarantee that all that is now required is to figure on transportation to make the industry a success. They have both quantity and quality in abundance.

The New Ferry House.

The great ferries, which for nearly twenty years have received and landed their passengers at or near the foot of Market street, are the chief connecting links between the metropolis and the outer world. It is true that many gain access to San Francisco by the Golden Gate and by rail along the peninsula, of which the metropolis occupies the northern end, but very few do not use the ferries at some point of their journeying. The ferry conveniences are, then, of interest and importance to the whole population of the Pacific Coast, and not the peculiar property of the thousands of commuters who seek their suburban homes through its well-guarded gateways.

The old aggregation of sheds with barn-like architecture, with interior walls bespangled with baking powder advertisements, with ceilings festooned with cobwebs and floors soaked with bilge water has for years been not only a municipal disgrace but an affair unworthy of the State. This has not particularly impressed the commuter. He always enters and leaves the ferry house with horizontal coat-tails, and if his course led him through even a more desolate structure he would not notice the good intentions on the floor nor tarry long enough to note the rise of temperature. The commuter is a straight line, the shortest distance between two points and the media permeated do not count. But to the intransigent from the interior of the coast or from the distant world the ferry inconveniences of San Francisco have always been a surprise, a disappointment—an insult.

Probably while San Francisco had a system of wharves which could be fairly counted a disgrace to a salmon can-

Building a Water-tight Masonry Dam.

Mr. Walter McCulloch read a paper at the last meeting of the American Society of Civil Engineers on "The Construction of a Water-tight Masonry Dam," and an abstract is published in the *Engineering News*. The dam described was the Sodom dam on the Croton aqueduct system, at what is known as "Double Reservoir I," or more familiarly as Sodom and Bog Brook reservoir. This reservoir consists of two basins joined by a ten-foot circular tunnel 2000 feet long, through which the water passes from the basin, which has the larger water-shed, into the Bog Brook basin, which has only $3\frac{1}{2}$ square miles of water-shed, with a storage capacity nearly as great as the former which drains 73.42 square miles. The combined storage capacity obtained in this manner is 9,500,000,000 gallons. Sodom dam, which impounds the water in the larger basin, is of masonry throughout, and the Bog Brook dam is of earth only. The Sodom dam spans a gorge and is 500 feet long at the opening line, which is 78 feet above the river-bed.

Examinations at the site were made by test pits and borings in 1886. The dam crosses the valley at right angles to the stream which here flows to the north, and at the site adopted the hill to the east showed an outcrop of hard gneiss rising abruptly 30 feet above water, with boulders and gravel at its foot. The rock back from this rose about 40 feet in 100, and was covered with a few feet of soil. The slopes on the west side were 15 per cent at water surface, diminishing to 5 per cent at top of dam, and the rock, which was from 4 to 10 feet below the surface, was decomposed and shaly for a depth of about 15

mortar. On top of this a bed of stiff wet mortar was laid and capped by a large rubble stone. After the first six feet of rubble foundation had been placed there was no further trouble.

The dam for about 40 feet of its height is of rubble masonry laid in Portland cement mortar mixed 2 to 1. Above this there was facing stone, 30 inches deep, laid in 2 to 1 Portland cement mortar, backed with rubble in mostly 2 to 1 mortar. The rubble stones varied from a cubic foot to a cubic yard in bulk, and were laid in full beds of mortar. There were no through horizontal joints. Joints were filled with mortar, into which as many stone spalls were forced as was possible. All stone was marked before using. Sand and cement were mixed dry, and then wet only when required. All cement passed through a sieve of 10,000 meshes, and was carefully tested. All loamy sand was rejected. The face stone was a light bluish gray limestone, cut rectangular, with rock face. Stretchers were 3 to 6 feet long by 30 inches wide, and headers 4 feet long. The thickness of courses diminished from the bottom up. The beds were at right angles to the face, and the stone had to be held in place with wooden blocks and wedges, to prevent slipping until the mortar had set, after which the blocking was removed and spaces left were filled with rubble. The dimension stone was brought by rail from Wilmington, Del.

Stone setting was done by the use of the cable, the traveler and derricks. The cable consisted of a $2\frac{1}{2}$ -inch steel-wire cable, stretched over and parallel to the dam, and over towers 667 feet apart, and anchored in the bedrock. On this a trolley ran, which was worked by a double-drum reversible engine. A load of 10 tons would sag the cable 25 feet with a clearance of 5 feet above the coping. Most of the excavation was removed, and all material delivered on the wall in this manner. The cost of the cable erected

THE PROPOSED UNION DEPOT AND FERRY-HOUSE, SAN FRANCISCO.

nery it was impractical to do anything decent in ferry landings. As, however, the water front belongs to the State, the city is not chargeable with the long-endured outrage to the traveling and commercial classes. For years the work of sea-wall and pier building has been pursued and the ferry improvement has been finally reached. In this place we merely mean to call attention to the very creditable structure which is now projected on the general lines shown in the engraving on this page. It is designed to be a union ferry house and thus will accommodate the several ferries plying to different points on the bay shores. The outside dimensions will be 850x150 feet, and the general cornice-line will be 50 feet above the base. Three entrances will extend the entire length of the building, and a like number of grand staircases will lead to both of the upper floors. These entrances will have three large arches extending through both stories, and from the central arch in each entrance there will be a staircase to the second floor. The entrances will project 35 feet from the seawall, and thus break the long line of the building. The arches will be one on either side of the main entrance and the third in the center. On each side of the arches will be great Corinthian columns 21 feet in circumference. The whole front of the ground-floor will be crossed by a continuous arcade, a covered passage-way leading directly to the ticket offices, baggage-rooms, etc.

Surmounting the center of the facade will be a tower of 250 feet. To support this a separate foundation is needed. The tower will not only be the first object to meet the eye of the passenger on the ferry-boat, but will serve as a clock-tower and beacon, visible for many miles. The tower will be made of iron and steel, and will not only be fire-proof, but earthquake-proof as well.

The first floor will be divided into various waiting-rooms, baggage-rooms, postoffice, and express-office. The second floor will in a measure be a duplicate of the first, and will be so constructed to accommodate passengers to or from the upper decks of the ferry-boats. On this floor the refreshment-rooms will be located, and also the offices of the Harbor Commissioners. The principal feature of the second floor is a corridor 50 feet in width, and extending the whole length of the building. The exterior face of the building will be of Roman brick and terra-cotta, with a base of granite. The interior face will be of glazed and enamel bricks.

feet. The rock in the river-bed was solid and was overlaid by a light deposit of sand and gravel. The ridge to the east, below the site of the dam, was parallel to the river and about 75 feet above it, and a dam of earth 600 feet long was constructed upon it to the height of the masonry dam, and at the north end of this earth dam is the spillway dam, which is a masonry wall 8 feet high and 500 feet long, with the lip 10 feet below the top of coping of the Sodom dam and 6 feet below the flood line. After passing this the waste-water follows through an old water-course in a channel cut to the rock and between curved retaining walls.

The greatest height of the dam (above rock) is 98 feet, the thickness at bottom is 53 feet, and under the coping 12 feet. The total batter on the lower face is 37 feet, decreasing from 9 3/4 in 10 to 2 7/8 in 10. The batter on the back is 10 per cent up to 38 feet below the top and plumb above that point. The gate-house is 37x42 feet and rises 23 feet above the dam near the center. The discharge is through two 48-inch pipes, which pass through the body of the dam. The work was begun February 22, 1888, and completed and accepted Oct. 31, 1892, nearly three years after the date fixed by the contract. The floods in the stream rise suddenly and the discharge in a spring freshet reaches 250,000 cubic feet per minute. To control this during construction, a timber crib dam was thrown across the river about 80 feet above the site of the work and a canal cut 26 feet wide and 15 feet deep on the west side and around the work to a point 500 feet below. The gatehouse and eastern half of the dam were then built to about 25 feet above the discharge pipes, and in the dry season of 1889 the water was turned through the pipes and the other half of the dam started.

In preparing the foundation all loose rock was removed by dynamite, and afterward all loose seams or shakes by blasting with black powder and harring out. The foundation was swept with wire stable brooms and washed clean. All pockets or holes were then filled with rich Portland cement concrete. A tighter bond, it was found, could be made with rubble consisting of small stones than with concrete beds. Water entered through several seams in the rock and would wash the mortar out of the concrete, but it could be led around the rubble beds until finally a small well 2 feet in diameter and 1 foot deep was formed at the point where the water boiled up. After the mortar had set the well was bailed out and filled quickly with dry

was \$3750. The first cable, after 15 months' use, parted without warning under a load of 6 tons, the break in the author's opinion, being probably due to unequal wear at the point where stone and cement were hoisted. The towers were then raised 10 feet, as to lessen the tension, and a new cable supplied, which lasted until the completion of the work. When the wall had reached a point 31 feet below the top, the standing derricks were replaced by a traveling derrick, mounted on a 30-foot trestle and running on a track of 36-feet gauge; a boom 55 feet long was used with this derrick.

The most serious flood occurred in November, 1889, when 3.8 inches of rain fell in 18 hours, and 8.7 inches during the month. In eight hours after the rain had ceased, the water rose to 10 feet behind the dam, and in 12 hours to 15 feet, and poured over the top of the dam, although both 48-inch pipes were discharging to their full capacity. No serious damage followed, as part of the dam over the channel was kept 4 to 5 feet lower than the balance of the wall.

The final estimate for dam and appurtenances was \$436,499. The lowest bid received at the letting was \$366,990; the highest, \$583,315, and the engineers', \$540,030. The difference between the bid and estimate was due to modifications in the plans.

The dam is water-tight. With 68 feet of water behind it, no leaks whatever have been found, either through or under the wall, or around the ends. Sweating at the joints appears at points, but not so much as to cause a trickle; and it cannot be seen on a dry day. This very desirable result is due to the excellent materials used, the care in preparing the foundation, thorough cleaning of all stone, care in mixing mortar, breaking of joints horizontally and vertically and close attention by the engineers to every detail. In addition to this, the desire on the part of the contractors to do good work and the existence of a proper relationship between them and the engineers were factors. The contractors were Sullivan, Rider & Dougherty.

THE purchase by Goodall, Perkins & Co. of the controlling interest in the Oregon Coal and Navigation Company's steamers and coal mine is looked upon by business men with great favor. The coal mine at Marshfield was about to be shut down, but under the new management the mine will be opened on a larger scale and give employment to several hundred men. It has always seemed

strange that Goodall, Perkins & Co. did not own their own coal mines, since they are such large consumers on their steamship lines. Goodall, Perkins & Co. will in the future operate the line of steamers to Coos bay, and the passenger and freight traffic between here and southeastern Oregon will be benefited. The purchase carries with it all of the company's property, including the mines and mining lands on Coos bay, the three-mile road to the bunkers at Marshfield, the immense bunkers where steamers go alongside to load, the wharf and warehouses at Marshfield, the hoisting gear and tramway in this city from Vallejo-street dock across East street to the main bunkers on the State lot and the ground lease, and the steamers Arago and Arcata. The Arago is an iron steamer of 620.6 tons net. She was built at the Union Iron Works in 1885 expressly for the coal trade between here and Coos bay. Her coal-carrying capacity is about 1200 tons. The Arcata is a much smaller steamer, registering only 415.56 tons net. The coal mines and mining lands are about three miles from the town of Marshfield, on Coos bay, and are reached by a small railroad about three miles in length. At one time these mines were quite productive, but of late, it is understood, the developed parts have been pretty well worked out, so that the new owners will be given a chance to branch out and open new ledges adjoining. The coal mines in southeastern Oregon are practically inexhaustible and several new claims near the shores of Coos bay are being opened, while there are plenty of others that are awaiting capital for future operations.

The Asphalt of Trinidad.

We take the following from a report prepared by U. S. Consul W. P. Pierce, at the request of the U. S. Government:

It is quite a difficult matter to say what the market price of asphalt is at Trinidad, because it is subject to so many anomalous conditions. The original cost to the government or to the owners of the lands prior to the asphalt rage was substantially nothing, and the cost to those who have since purchased lands varies.

In respect to present dealers, very little if any pitch is sold in isolated quantities. The usual contract is for the owner or lessee of the land to deliver so much pitch at a certain price annually for a term of years. I should judge that those dealers who have contracted for La Brea land pitch within the last six months have had to pay somewhat more than the lake pitch is sold for to shippers to Europe, to wit, 28s. 6d. or \$6 84 in local money, free on board.

The following itemized estimate per ton in respect to land asphalt is believed to be a fair approximation:

Price of pitch in the ground.....	\$4 00
Digging, overlooking and cleaning.....	50
Carting.....	40
Loading lighters and loading ship.....	30
Lighterage from shore to ship.....	50
Contractor's profits, mercantile commission and all other expenses and losses.....	1 10
Export duty.....	1 20
Freight and insurance to New York.....	2 25
Total.....	\$10 25

When large quantities of asphalt are being handled or other favorable conditions intervene, this total could, of course, be reduced. It is a matter of public record, for instance, that the first cost of the asphalt taken from the pitch lake by the Trinidad Asphalt Company is only 40 cents per ton, and it can be dug more readily than the land asphalt.

I have heard it claimed that all the land asphalt at La Brea is substantially one deposit, and that applying the designation of "lake" to only a portion of it is incorrect; but the only part that can be said to be like a lake is alone called a lake by the community.

The village is on an extreme point called La Brea Point; another extreme to the east is called Point d'Or. The lake is further inland, being southwest of these points and about a mile from them, and about two-thirds of the way from Point d'Or to the opposite side of the peninsula. The lake has an elevation of 138½ feet, according to Wall and Sawkins, above high water, and on three sides the land slopes from it. It is circular in form, and covers, according to a government survey in 1886, 109 acres 9 perches, and it is believed to contain several million tons of asphalt. The geological report of Wall and Sawkins puts the maximum amount which can be expected to exist at 4,752,000 tons. Since this estimate several hundred thousand tons have been removed. The report mentions that the term "inexhaustible," applied to the lake, "has probably arisen from the circumstance of artificial cavities rapidly closing up, which may have led to the supposition of the substance being reproduced or generated as fast as removed; but it is essential to remember that every pound abstracted diminishes the remaining quantity by that amount." I believe from the information I have obtained that the contents of the lake have decreased in volume during the last decade, indicating that the supply, if it has one, is not equal to the drainage that is now being made from it.

Persons who have seen a large round pond, substantially dried up, with little strips of clear water irregularly intersecting its bed, here and there patches of vegetation, and a slushy looking place near the center with fish bubbles coming up, the entire bed blackish and uninviting, can form a very fair idea of the general appearance of this famous lake. An odor described to be like that of sulphureted hydrogen gas is emitted at the sloppy looking place called the "place of supply," where many gaseous bubbles appear. In passing over the lake one will see more or less of these little bubbles, and if he stoops down and catches the odor from them he will find it the same as the odor at the "place of supply" near the center. There are also over the lake more or less little swellings of different shapes and sizes, and I am told the smaller of them (say an inch square) con-

tain only gas, and that some of the larger ones (say a foot square) contain both gas and decayed vegetation.

There are large numbers (say two or three dozen) land islands over the lake which would probably aggregate about three or four acres. They are covered with vegetation, and some of the support trees 20 or 30 feet high; but I am told these islands do not come up from the bottom of the lake, nor do they bear down any considerable distance into the lake. Mr. J. W. McCarthy, the local manager of the Trinidad Asphalt Company, informed me that he destroyed one of them, and the pitch under it arose to its own level, or the general level of the lake. A horse may be ridden on the lake and up to the "place of supply," and, under particularly favorable conditions, I am inclined to think he might be ridden through it.

It is difficult to give a very satisfactory description of this particular spot, and no two descriptions of it can be exactly alike, for it is never identically the same on any two occasions. In an open space, say fifty acres or more, in which there is no vegetation whatever, may be seen a zig-zag, irregularly outlined spot, which undergoes constant change in shape and size (when I was there last and took a good look at it, it was bow-shaped and approximated an acre in size). It differs from the surrounding pitch in outward appearance, as freshly molded or bright lead would differ from led of a duller and darker hue. All of this fresher looking pitch is softer than the pitch surrounding it; but on some of it, at the more distant edges, one may walk without sinking below the heel of his shoe, and I apprehend from appearances, and was so told, that it is only a matter of time for the outer parts to become indistinguishable from the body of surrounding pitch. Within this particular area is located what is called the "place of supply," which is one or more spots where the pitch is always softer and where, in the hotter part of the days, the pitch, or rather the water surrounding the pitch, fairly boils. These soft parts constantly shift their position, and their fomentations undergo great change, seemingly regulated by the heat of the sun. I am assured by witnesses, whose word I cannot call in question, that they have seen the "place of supply" when a person could not have walked into it, both on account of the intense heat and the probability of being engulfed. I have never seen it present so terrible an aspect. On one afternoon, when it was probably in its usual state, in the hottest part of the day, I saw a man walk into it with impunity, and it only came up to the calves of his legs. He picked up a handful of the pitch and handed to me. It was as pliable as soft putty, and I manipulated it without any of it sticking to my hands; but the water which oozed from it somewhat discolored my hands, and I was told that if I had continued the manipulation longer, till all the water oozed out the pitch would have become sticky. Early one morning (eight or nine o'clock) I visited the "place of supply," and the man I had with me walked all over the softest spot without sinking deeper than his foot. At that time two carts containing barrels were being loaded with the "liquid pitch," and the process was to dig and pull it up with picks in lumps, which were put by hand into the barrels. I was told that in the hot part of the day the pick was dispensed with and the shovel used instead.

One of the cartmen pointed to a particular place, a foot or two square, where he said he had been digging that morning and which had filled up. The man with me stepped into this place and gradually sank nearly to his knees, but sank no farther. I also noticed that this pitch, unlike that on the previous occasion referred to, stuck with considerable tenacity to the man's legs.

The little channels of water referred to constitute quite a relief to the view. These are quite clear and pretty. They vary in width; but, unless unduly swollen by rainy weather, they may be roughly estimated at two to six feet wide and, say, one foot to two feet deep, though in places the water is much wider and deeper. By these deposits of rain-water the lake is divided into a great many irregular divisions. Several persons told me that it was their understanding that these little channels rose and fell with the tide, which seems unreasonable; but, as the opinion is entertained by some of the residents of the neighborhood, I submit it. The pitch comes holdly up to the water, but rarely, if ever, slopes gradually into it, but at the water's edge it is inclined to curve down abruptly, and under the water it does not promptly adhere to the pitch on the adjoining area.

It is understood that the pitch is in constant motion, and the theory has been advanced that each of these irregular divisions has a motion of its own. It would seem, from the appearances, that the water at the outer part of the pitch of the adjoining division has a very repelling effect on the advancing pitch, or else these several divisions of pitch do turn under and revolve respectively within themselves. But evidently the pitch yields in a marked degree to the influence of water. I noticed a little spot of water about six feet wide, which was probably three feet deep—a depression which, if not originally caused by the settlement of water on the spot is kept in existence by the water. In other words, the pitch would doubtless find its own level were it not for the water. I am strongly inclined to think that the "place of supply" described above, if not the source of supply or generation, is a source of general motion, the degree of motion lessening as it recedes from this center. The fact that there is a large area next around the "place of supply" on which no vegetation grows, and that, (in addition to the well-defined land island,) more or less vegetation is found as you approach the border, seems to indicate that the motion near the "place of supply" is too great for sufficient earth to accumulate on the surface to support vegetation.

A MOVEMENT is on foot at Fort Bragg, backed by Michigan capital, controlled by General Alger, Senator Stockbridge and O. R. Johnson and Messrs. White and Plummer of the Union Lumber Company, to build a railroad northeast sixty miles, to John W. Mackay's mountain of coal on the east side of Round Valley, all in the northern portion of Mendocino county. The Union Lumber Company, in which all these men are largely interested,

is a recent combination of the Fort Bragg and Noyo lumber companies and is the owner of many miles of railroads. The company has already built into the redwoods a standard-gauge road, seven miles north to Glen Blair and another nine miles east to McKay's Camp. This last is the road to be extended straight on through Sherwood Valley to the Indian Reservation coal mine. This cross-road would be promptly met in Round Valley by a north extension of the San Francisco and North Pacific and by a south extension of the Eel River and Eureka road from Humboldt Bay.

A Giant Redwood for the World's Fair.

The Eureka Times Rio Dell correspondent sends the following interesting account of the big tree from near Englewood that has recently been prepared for shipment to the World's Fair: "Mr. J. H. French has just completed the work of getting out a section of a mammoth redwood near Eel river and about two miles from Englewood. The log from which the outside was taken was twelve feet long and twenty feet in diameter at the butt, and bark and all scaled 36,000 feet board measure and was estimated to weigh when solid 129 tons; this, however, is not to be shipped whole. The outside or shell, about eight inches in thickness, is off, leaving the heart on the ground. It has been rafted down to the head of the Pacific Lumber Co's track and will go via Field's Landing to San Francisco, thence to Chicago, and when it reaches Jackson Park it will be put together and have a door so that visitors from all parts of the world can be admitted and see a Humboldt redwood outside and inside. Mr. French also got out a log two feet in length and fifteen feet in diameter and scales 3600 feet board measure, bark and all, and will be sent forward with the other pieces. This will be shipped in solid log and be a part of the Humboldt county exhibit. The shell is the property of Mendocino county parties, and has cost up to date \$750. The tree from which these pieces were taken was broken off 220 feet from the ground and was nine feet in diameter at the break, and Mr. French thinks the tree when standing at full height was 417 feet high. Mr. French is probably one of the best practical timber workers on the coast."

A Good Whitewash.

The following was "picked up" somewhere years ago, and parties to whom it has been given say that the wash is in every way satisfactory:

"Take one-half bushel of unslaked lime, slake it with boiling water, cover it during the process to keep in the steam; strain the liquid through a fine sieve or strainer, and add to it a peck of salt, previously dissolved in warm water, three pounds of ground rice boiled to a thin paste and stirred in while hot, one-half pound of powdered Spanish whiting and one pound of clean glue, which has been previously dissolved by soaking in cold water and then hanging over a slow fire in a small pot hung within a larger one filled with water. Add five gallons of hot water to the mixture, stir it well and let it stand a few days, covered from the dirt. It should be applied right hot, for which purpose it can be kept in a kettle or a portable furnace. It is said that a pint of this mixture will cover one square yard, if properly applied, and answers equally as well as oil-paint for wood, brick or stone, and is much cheaper. Coloring matter may be added as desired. For cream color, add yellow ochre; pearl or lead, add lamp or ivory black; fawn, add proportionately four pounds of umber to one pound Indian red and one pound common lamp-black; common stone color, add proportionately four pounds raw umber to two pounds lamp-black. The east end of the President's house at Washington is embellished by this brilliant whitewash; used by the Government to whitewash lighthouses, etc.

THE company which recently purchased the North Pacific Coast Railroad intends developing some enterprises which will benefit Mario and San Francisco counties. One of these is the construction of a road starting from a point on Richardson's bay above Sausalito and running to Bolinas bay. At this latter point it is proposed to develop a second Coney Island. In the early part of this month the syndicate which Mr. Harvey represents purchased 10,000 acres of the Sausalito ranch for \$500,000 from the Tamalpais Land and Water Company. The ranch formerly belonged to the Throckmorton estate, and extends from the hills back of Sausalito along the bay and ocean nearly to Bolinas. It includes a part of Bolinas beach and its northern boundary takes in the southern slope of Mount Tamalpais. This beach has all the requisites of a watering-place, and here it is proposed to erect a magnificent hotel. The conditions for bathing are unsurpassed, and there are five miles of beach as hard and smooth as a floor. The climate is unexcelled by either Monterey or Santa Cruz. By the most favorite route the proposed new line will be but twenty-one miles long, and as it will skirt the ocean for a part of this distance, it will afford a magnificent ride. Persons leaving San Francisco will be able to reach the resort at Bolinas beach in less than an hour and a half. The new road will open up a rich farming district, and the agriculturists are already jubilant over the prospect of an opportunity to get their products to market. It is estimated that the new road, hotel at Bolinas and ferry-boat will cost at least \$1,000,000.

THE South Yuba Water Company is considering the proposition of furnishing Sacramento with electric power and later with pure water. Both plans have been declared practically feasible. A survey has already been made from Roseville to Sacramento. Dr. Van Norden said that 1000 horse-power could be brought to Sacramento in sixty days' time. Such a scheme will not only prove a boon to Sacramento but to Placer county as well. It would give employment to many and all the towns below Auburn could maintain an electric light plant.

A Timely Publication.

HAUPT'S STREET RAILWAY MOTORS.

JUST READY.

STREET RAILWAY MOTORS, with Descriptions and Cost of Plants and Operation of the Various Systems in Use or Proposed for Motive Power on Street Railways. By HERMAN HAUPT, C. E., Chief of Bureau of Military Railroads during the late war; Late Chief Engineer Pennsylvania R. R.; General Manager Northern Pacific R. R.; Chief Engineer Air Line; Chief Engineer Tide Water Pipe Line. In One Volume, 12mo., 215 pages, price \$1.75. By mail, free of postage to any address in the world.

EXTRACT FROM THE PREFACE:

"The present age seems to be peculiarly prolific in the invention of motors for street railways and in new applications of old and recognized motor forces for propulsion of the cars used for urban and suburban transit. Some of these possess decided merits, and present claims for the support of capitalists and of the public that are, at least, worthy of careful examination; others are advanced by parties who are evidently ignorant of the thermodynamic, chemical and mechanical laws upon which some of these operations depend, and schemes are sometimes presented that are visionary and impracticable. A brief review of the plans proposed for street railways, their merits and defects, with the cost of plant and of operation, will probably possess sufficient interest at the present time to excuse the preparation and publication of this volume. The aim of the writer has not been to furnish an elaborate treatise requiring for its comprehension a high degree of technical knowledge, but rather a simple statement of principles and their applications that will be readily comprehended by persons of limited scientific attainments—a treatise for the use and information of investors and of the public."

ABSTRACT OF CONTENTS.—I, Horse Railways; II, Steam Motors; III, Ammonia Motor; IV, The Hot-Water Motor; V, Gas Motors; VI, The Pneumatic or Compressed-Air Motor; VII, Tests of the Hardie Compressed-Air Motor; VIII, Economical Modes of Compression; IX, Cost of Operation of the Compressed Air Motor for One Day; X, Other Air Motors; XI, Cable and Electric Roads; XII, Electric Lines; XIII, Low-Pressure Air Motors; XIV, Storage Batteries; XV, Cost of Carbonic Acid as a Motive Power; XVI, Transmission of Power by Means of Pipes; XVII, General Summary; Appendix; Index.

The above or any of our books sent by mail, free of postage, at the publication price, to any address in the world.

A circular showing the full table of contents of the above book sent free to any one who will apply.

Our New and Revised Descriptive Catalogue of Practical and Scientific Books, 88 pages, 8vo., and our other Catalogues, the whole covering every branch of Science applied to the Arts, sent free and free of postage to any one in any part of the world who will furnish his address.

BUILDERS OF

"Sensible" Horse-Power Hoisting Whims.

(DAVIS PATENT.)

PRICES REDUCED.

The "Sensible" Hoist is the cheapest and beyond doubt the best in the market. It is built entirely of iron and steel, mounted on a heavy iron base plate, and is therefore very durable and not affected by exposure to climatic influences.

The bevel gear on the drum shaft is loose, and, in hoisting, drives the drum through a friction clutch. This avoids the frequent accidents occurring with other whims, occasioned by the breaking of the gear teeth when throwing them out of gear. In lowering, the drum is pressed by a powerful screw lever against brake woods at the opposite end. Perfect means of adjustment are provided for the friction clutch and brake blocks.

As the drum is entirely independent from the driving gears the operations of hoisting, dumping bucket and lowering can be performed with the horse in constant motion, a feature not possessed by any other horse hoist in the market, and one that greatly increases the capacity of the machine by avoiding the loss of time due to stopping and starting the horse.

It is very light and compact and very easily taken to pieces for transportation by mules. The cost of erection is very small, two men in half a day being able to put it in place ready for work.

Weight of hoist, 1200 lbs. Total shipping weight, including sweep, levers and shaves, 1400 lbs.
Circulars giving Capacities and Prices furnished on application.

Mechanical Progress.

Lamination in Metal.

Prof. John Tyndall contributes something new upon the subject of cleavage, as it occurs in crystals, rocks, ice and other bodies; and his studies lead inevitably to the conclusion that lamination results from the operation of the same laws under analogous conditions as those which produce the property known in mineralogy and crystallography as cleavage.

At first, one would suppose wax, or baker's dough, to be most unlikely substances wherein to detect any tendency to cleavage; yet it is precisely with these materials, wherein plasticity is a most prominent physical property, that Prof. Tyndall has performed experiments that are commanding the attention of the scientific world, and the results of which have an important bearing upon the metallic processes. In these plastic materials and others, such as clay and graphite, Prof. Tyndall has proved that cleavage may be developed in as marked a degree as in slate—even the varieties of the latter used for roofing—by the simple application of pressure to the plastic mass. Cakes of wax that have been thus treated are easily split up into regular laminæ, so uniform in character as to excite the surprise and admiration of those who have witnessed the experiments.

These researches appear to have proved that any material, no matter how plastic or how homogeneous it may appear to be, has within it the condition for the development of cleavage, and that the only external condition necessary to produce lamination is a sufficient degree of pressure exerted in one direction upon the mass. The resulting planes of cleavage will be at right angles with the direction in which the pressure is applied. The philosophy of this effect lies in the fact that, as relates to the cohesion of its particles, no substance is strictly homogeneous; that is to say, the particles, granules or molecules of substances do not possess cohesive power equally in all directions; and hence, when pressure is applied to them, they slide over each other (the sliding surfaces being those of least cohesive power), and move toward a point of less pressure. In the case wherein pressure is applied in one direction only, the sliding will be in a direction at right angles with the direction of the pressure, and thus plates, laminæ or strata are generated in the mass, the limiting faces of these layers having less cohesion than their interior parts.

It is thus that under the action of the rolling-pie flaky pie-crust is formed. The same kind of stratification is formed in a biscuit, while in bread, the loaves of which are shaped by kneading, this stratification is absent, and a fibrous structure—called by bakers the "pile"—results from the difference in the manipulation. It is entirely indifferent what kind of material is thus operated upon, provided that it will in some degree yield to pressure without crushing into powder; the result of pressure exerted in one direction more than in any other will result in lamination more or less marked. A practical illustration of this kind of action is found in iron and other metals. When iron undergoes the ordinary process of rolling, it is taken at a welding heat from the furnace, and the uniformly distributed heat weakens the cohesive power of the particles quite equally throughout the mass; the result is a fairly homogeneous bar or plate. However, in bars the tendency to longitudinal stratification is manifest, and when the bars are cold and cohesion has again been restored to its normal power, it can always be found that iron so produced is stronger longitudinally than laterally.

The Ferris Wheel.

One of the interesting "side shows" on the Midway Plaisance will be the great steel wheel designed by Mr. G. W. G. Ferris, of G. W. G. Ferris & Co., engineers, of Pittsburg, Pa., which is to carry passengers in cars swung from the periphery. The wheel will be 250 ft. diameter, built up of structural iron, and the top will be 264 feet above the ground. There will be practically two wheels, 28 ft. 6 ins. apart, and connected by bracing. The steel axle is of enormous size, 33 ins. in diameter, 45 ft. 2 ins. long, and weighs 89,320 lbs. Its cost was \$35,000. It was forged by the Bethlehem Iron Works and shipped to Chicago on March 18th. The axle is supported in bearings on steel towers 137 ft. high, and having four main columns, the two inner ones vertical, and the two outer ones inclined, with arched portal entrances and the usual bracing. Ample provision has been made for wind pressure on the wheel and towers. The towers are

50x40 ft. at the base, and 5 ft. square at the top, and having masonry piers on pile and concrete foundations, with a load of not over 2,000 lbs. per sq. ft. of base.

Between the two rims of the wheel will be 36 passenger cars, swinging on trunnion bearings so as to remain in their normal position during the revolution of the wheel. The cars will weigh about 19 tons, and each accommodate 60 persons, or 2,160 passengers in all. The landing platforms are arranged so that six cars can be unloaded and loaded at one time. Passengers will be given two complete revolutions, occupying about 20 minutes, the distance traveled being nearly a third of a mile.

The total weight of the structure is 4,300 tons, about 60 per cent of which will be in motion. According to the published particulars the engines to turn this wheel will be 2,000 H. P., and will consist of two reversible engines, with cylinders 30 ins. diameter and 4-ft stroke, with link motion. These will drive a train of gearing with wheels 12, 14 and 16-ft. diameter, with a steel chain passing over a cast steel pinion on the main axle. Only one engine will be used at a time, the other being for use in case of a breakdown. The machinery will be in a chamber below the surface of the ground, where the electric lighting plant will also be installed, as it is proposed to light the cars and the wheel by about 3,000 incandescent lights. F. J. McCain & Bro., of Chicago, have the contract for erection. The total cost of this wheel and its accessories will be about \$300,000.—Engineering News.

STEEL BARRELS.—A new industry is springing into life at Barrow, England. For some time, experiments have been conducted at Wakefield, in the production of steel barrels for the conveyance of petroleum, and, as they have proved to be a success, the works of Caird & Purdie, ship-builders, are being fitted up with machinery to produce these barrels. In the first place, these barrels, which are light steel, are made in halves by means of compression in a mold, when hot. Afterward they are welded together by means of electricity. The operation is in every sense a novel one, and will be watched with interest. The barrels are intended for use by the large oil-carrying companies engaged in the oil trade of the East.

MANY people have been troubled to explain why a high frequency current does not hurt a human being when it can illuminate. It has been recently suggested that the "skin effect" is such that, practically, there is no passage except over the surface of the body. Of course a very small current will serve a lamp if the "skin effect" also comes into play in the lamp filament, says *Invention*. But the experiments are said to have been tried with a powerful coil, when the pain was found to be unbearable before the lamp began to light up. This may have been because the frequency was lower. The experiment of lighting an incandescent lamp in series with the body has been exhibited in France, and since then by Campbell Swinton in England.

Two improvements in the treatment of nitro-glycerine are said to have been devised by M. Eduard Liebert. Both improvements are calculated to reduce the danger which attends the use of this substance. Ammonium sulphate or ammonium nitrate is added to the acid mixture during the operation of nitration by one of the improved processes, and has the effect of destroying the nitrous acid formed. The other "improvement" is an attempt, by adding isosoyal nitrate to the finished nitro-glycerine, to prevent it from congealing when exposed to low temperatures.

THE largest turret ship in the world, the Hood of the British navy, successfully passed the official trial of her machinery two weeks ago. She has a displacement of 14,150 tons, and under forced draught she made an average speed of 17 knots. The trial of her 67-ton turret guns was exceedingly satisfactory. The total cost of the Hood when fully equipped will amount to nearly \$950,000. She is a sister ship to the Royal Sovereign, except that her guns are mounted in turrets instead of barbettes.

TIN-PLATED YARN.—A method has been invented in Germany of covering tissues of cotton yarn with a flexible and brilliant deposit of tin. A clear paste of commercial zinc-powder and white of eggs is first made and spread on the textures with a brush, the coating coagulating when drying. The tissue is then placed in a bath of perchloride of tin, which metal is precipitated on the zinc; and the article, after rinsing and drying, is calendered, an operation imparting luster to the layer of tin.

Scientific Progress.

Falb's Earthquake Theory.

Zante's latest earthquake experience, in which the ruin began by the shocks of January and February of this year, was made complete, had far more significance to the world of science than to the other world of newspaper readers, which saw in it nothing more than a serious calamity to a people on whom disaster had already laid a grievous burden. The prediction of Rudolph Falb, made a few days before that Sunday, April 16th, would witness a renewal of earthquakes in places previously subject to seismic disturbance, seemed at the time to be preposterous. It turned out to be strikingly accurate, for Zante's rocking and swaying began on Monday morning, just a day later than the time set in the prophecy of Falb.

It is to be borne in mind that Rudolph Falb is in no way like the charlatans of this and other lands who make a business of predicting physical phenomena and who rarely fail to be ridiculously wrong on all points. Falb has a theory about earthquakes worked out from years of study and observation, which has attracted no little attention among the geologists, who never tire of considering that puzzle of the globe, the earthquake. Briefly stated, Professor Falb's theory is that the interior of the sphere is a slowly cooling molten mass—a vast, seething liquid sea—and that between us and this place of intense heat there lies a crust of undetermined thickness. Here and there the outer shell is weaker and thinner, or is cracked so as to form flues, and these are the regions of earthquake and volcano. The enormous volumes of gas generated in this glowing mass are continually and with growing force pressing against the earth's thin shell, seeking for escape. But further than that, Falb believes and considers himself able to prove that the molten interior of the earth is subject to the mighty and mysterious forces of solar and lunar attraction. This being so, at the seasons when the earth is most subject to these forces, tides of incalculable magnitude are formed in the sea of liquid fire and sweep throughout the earth's interior, adding the pressure needed to force a way out for the peat-up gases or to produce in conjunction with the other forces of contraction and expansion terrific explosions in the interior of the globe.

Four years ago the theory of Falb was fully discussed before the technical society of the Pacific by Otto von Geldern, the Secretary of the society. From him has been obtained some account of the matter which has never before been explained in a popular way.

Falb was led to consider ten principal conditions which may be summed up as follows: That there are three motions in earth tremors, a heaving upward, an undulation of the crust and twisting or whirling motion, the last accompanying violent shocks; that the first shock, though short, is the most violent, beginning with a slight tremor and increasing till it culminates in a final sharp explosion, being followed by lighter secondary shocks, which decrease in violence till the seventh day, and then increasing somewhat and ending the disturbance; that a peculiar rumbling generally precedes, but sometimes follows, a series of shocks; that earthquakes are often attended by peculiar electrical conditions of the atmosphere; that littoral tremors, if violent, are followed by tidal waves; that changes in the level of coast and sea bottoms, as well as changes in ocean currents, often follow catastrophic shocks; that earthquakes are sometimes directly followed by heavy rain showers; that the area of tremor is more or less elliptical, the motion being transmitted in circular waves from the epicentrum, the point where the shock, received from below, is most violent; that where there are high mountain ranges earthquakes are the most frequent, the frequency being greatest in or near the tropics.

The most interesting portion of Falb's theory is that expressed graphically in curves showing the ratio of distribution as between the months. Of this Mr. von Geldern writes

"We find a certain similarity in the structure of these curves to all preceding ones, with the April and October maxima a little too prominently developed, but with a decided minimum for the summer months. Certainly, language cannot speak plainer than do these graphic illustrations, as they bring out, at random as they are taken, again and again the facts to which we have called attention. Can this be a matter of chance? Would it seem so unreasonable to suppose that the January maximum may be caused by the earth's perihelion; the April by the sun's position in the equator (about

March 20th, when two forces—the centrifugal force of the earth, and the attraction of the sun—are operating in harmony); that the June minimum may be due to the earth's aphelion, when the sun's attraction is least; that the October rise is brought about by sun's reaching the autumnal equinox, September 23d; that the fall for November is due to the sun's increase in southern declination, and that as the earth sped toward perihelion the curve of frequency would again reach its greatest height?

"Falb says there can be no reasonable doubt about it, and if these curves teach anything they teach that nearness of the sun stands out as the principal factor, assisted perceptibly by the equatorial position of the sun as a cause for the greater frequency at such seasons of the year."

The second factor Falb finds to be the moon's power of attraction, in which conclusion Mr. von Geldern agrees.

Water in the Spheroidal State.

While carrying on a piece of work recently which involved the use of a common Liebig condenser, it was noticed that where the stream of waste water fell into the water-trough, the bottom of which was rough, small globules of water were formed, which darted out on all sides and ran on the surface of the water to the sides of the trough, eight or ten inches distant. Frequently they would rebound from the side and start back, but would soon disappear. The globules varied in size from an eighth of an inch in diameter to very minute. Sometimes while running along they would gradually decrease in size until they would disappear, while others would disappear in an instant. In a few cases the size suddenly decreased to about one-half the original diameter, the globule then continuing on its course without further change, until it at last suddenly disappeared. Sometimes two globules would run together, combine and continue on their course as one globule of increased size. In other cases, instead of combining, they would rebound from each other like rubber balls. This rebound also took place when they ran against an air bubble. In one case a globule about one-eighth of an inch in diameter reached the side of the trough and rebounded, but it was reduced in size to about one-half of its original diameter. It was noticed, also, that they did not all move with the same velocity; some shot across the water with great rapidity, while others moved very deliberately, both kinds of movement taking place at the same time and in the same direction. In rare instances the globules stopped and lay at rest on the surface of the water until their final sudden disappearance. The rapidity was always greatest at the beginning. In order to ascertain how rapid a current there might be (the water was about a quarter of an inch deep), bits of wood were floated on the surface. The current thus indicated was many times slower than the movement of the globules.

Particular attention was given to ascertain at what place the globules originated. The falling stream made a circular depression in the water about an inch in diameter. The globules seemed to spring up from the outer edge of this depression, fall back on the surface of the water, and then run rapidly away as described above. The thought suggested itself to me that many, if not all, of the observed phenomena could be accounted for by rapid-whirling motion of the globule. The gradual slackening of the motion, the fact that some stopped on the surface of the water, the quick rebound from the sides of the trough, are all effects which can easily be produced by a rapidly-whirling ball on a plain surface, like the well-known movements of a billiard ball. This would also account for the phenomenon of a ball of water floating on water without blending with it, somewhat on the same principle that stones can be made to skip over the surface of water without sinking at once, or, more remotely, as the pitching of a curve in base-ball. The conditions, too, at the place of origination of the globules, were just such as would produce a sharp twisting motion. The falling stream was first turned to the side by the bottom of the trough and then upward, until at the top of the rebound the little globules sprang out.

I do not recall ever having seen the above explanation given, and so it is offered for what it is worth.

The temperature of the water was never above 30° C., which would preclude the common explanation for high temperatures. Afterward the same effects were obtained, on a smaller scale, when the prongs of a large vibrating diaphan were dipped into water to show the effects of vibration.—C. H. Ehrenfeld in Science.

Useful Information.

Mechanical Theory of the Corona.

The *Herald's* correspondent at Valparaiso cables: Professor Schaeberle has sent the following account of his observations of the total solar eclipse at Mina Bronces: "Sunday was a pleasant day for viewing the eclipse. The corona was very brilliant and much extended in all directions. It was similar to the corona of the eclipse of 1883. Eight photographs, 10 by 20 inches in size, were obtained from the heliograph; ten photographs were secured with the six-foot telescope, and the same number with the three-foot telescope. I also obtained six photographs with the one-foot telescope, and seventeen camera photographs with the forty-foot glass.

"These photographs demonstrate the enormous prominences, and also show solar clouds nearly 100,000 miles in height, floating around through space. The solar rays and others were long, conspicuous and trumpet-shaped in outline. The preliminary results are a strong confirmation of my mechanical theory of the corona."

Prof. E. S. Holden, of the Lick Observatory says: A cipher telegram received from Professor Schaeberle in Chili informs us that the Lick Observatory expedition to observe the total solar eclipse has been successful in every respect. The mechanical theory of the solar corona formed by Professor Schaeberle has been verified.

A drawing of the corona of April 16th last was published by him in January last, with a prediction as to what this corona was to be like, and I understood his telegram to mean that the picture made by him months ago was a true representation of the actual corona visible at the eclipse. This is an important verification of a very far-reaching theory.

The expansion of the solar corona was first photographed at the California eclipse of January 1, 1889, and was fully described in the Lick Observatory report of that eclipse. Its existence was doubted by various European astronomers, and the cloudy weather did not allow it to be plainly photographed at the eclipse of December, 1889. Now, however, Professor Schaeberle has telegraphed that it has been again successfully photographed at his station high up in the mountains.

Fifty photographs have been secured by Professor Schaeberle and his assistants, who used three different telescopes. One of these instruments gives an image of the sun four inches in diameter, and the corona covers a plate eighteen by twenty-two inches. The whole programme was satisfactorily carried out.

It is only proper to add, the expenses on the Lick Observatory expedition were generously provided for by a gift from Mrs. Senator Hearst of California, to whom science thus owes a new debt.

Oranges as a Medicine.

It cannot be emphasized too strongly, especially at this season of the year and in this part of the world, that pure fruit juice is one of the best blood-purifiers and system-regulators there is. In fact, it is said to be the base of physicians' prescriptions in cases of depleted systems and impure blood. There are people in this place who testify to this fact, particularly as to oranges. Some people, who have heretofore eaten fruit between meals or just before retiring and condemned it as injurious, have learned in California to eat one or two oranges with nearly every meal, particularly breakfast, and have found to their pleasant surprise that it was better than any medicine they had ever taken.

Many remarkable things have been claimed for oranges taken as a food, such as making the complexion clear and beautiful, curing the drink habit and numerous other things as varied and marvelous as the achievements of corn medicines, and there are, doubtless, persons who have made themselves miserable and ridiculous eating oranges by the wholesale in the endeavor to accomplish some such impossible result.

But thousands of persons can testify that a judicious use of oranges is a good thing; but a few precautions must be taken. In the first place, buy nothing but good fruit, especially ripe fruit. Green or bad fruit cannot be good for anybody. Then, if you do not eat the orange out of the shell with a spoon as many prefer to do, be sure to peel it carefully. The white pith lying beneath the yellow rind is one of the most indigestible substances known in the vegetable world. It is better to eat oranges with a spoon and take as little as possible of the cellular matter. Do not eat too many oranges at

first; but if the habit of eating them with meals is once formed, a person will never be satisfied to eat a meal without fresh fruit of some kind. The habit will work wonders in a short time toward regulating the system, keeping the blood in good condition and creating a healthy appetite.—Pomona Progress.

Cholera, Its Cause and Prevention.

At the State Sanitary Convention held in this city last week under the auspices of the State Board of Health, Dr. Geo. C. McDonald of Sausalito, submitted a very able paper, "Cholera, Its Cause and Prevention." The speaker reviewed the history of cholera from 1669 to the present day. It had been proven, he said, that air had little, if anything, to do with spreading the disease. It was disseminated through the medium of water, food and merchandise. This was shown by the fact that the disease followed the line of commerce, moving neither faster nor slower than people and freight moved. The bacillus of cholera lives in butter a month, in beer five days, in cheese curds not quite a day, in hoiled milk, if the cholera germ is added after the boiling, it will live indefinitely, in white wine it lives but five minutes, in red wine fifteen minutes, in cold coffee two hours, in cold tea nine days and in strong tea an hour. In spring water the cholera bacillus lives to eight days, in well water three months. It lives in ice, is propagated best in warm, damp places and is only killed by boiling.

As a prevention, while favoring inoculation by Koch's method, he was aware that even that remedy would not afford complete immunity. As for quarantine, personally he considered it absurd. What was the use of imprisoning people and fumigating them when the ships with cargoes of sugar, etc., in which tens of millions of cholera germs were living, come into port untouched. Absolute quarantine was a commercial impossibility, and anything less was useless. If he could have his way he would have in every city, town and hamlet corps of competent inspectors to make a house to house canvass and clothe them with authority to compel the people to keep themselves and their premises clean. Disinfectants should be furnished by the State and lavishly used. There should be no public funerals, and the bodies of all persons dying of cholera should be cremated. Then he would have slips printed in every known language as follows, and distributed to every house should cholera make its appearance in the State:

Keep your house well ventilated, light and thoroughly dry; do not wash the floors, but give them a dry scrub. See your air shafts, traps and drains are in perfect order; see your dust-bin is frequently emptied and its contents disinfected. Burn in your stoves all rags, vegetable refuse, such as cabbage-leaves and potato peelings. Sever all direct communication with the waste-pipe of the drain. Cleanse and wash out all your water-pipes and tanks. Let every drop of water used for drinking or washing be boiled before use. Do not use boiled water which has been standing for six hours without again boiling. Never use ice in any form; it may contain the germ of disease. In the same way and for the same reason avoid ice-cream and candy and tinned provisions. Never use filters, for if not kept perfectly clean and in working order they are simply deathtraps. Do not eat any raw fruit or salad, or bread more than twenty-four hours old; bake your own bread if practicable; if not use toast. Take no milk unless it has been previously boiled. Use no syrups of any kind; eat no butter; avoid weak cold tea; hot coffee is the best drink. Take four wholesome meals a day. Do not overload the stomach. A meal may consist of any sort of nutritious food, fresh and thoroughly cooked meats and fish, well-toasted bread, well-boiled green vegetables and potatoes, plain farinaceous pudding, eggs, etc. Alcohol must be taken in great moderation, only at lunch and dinner. Avoid purgative medicines, excesses, irregularities of every kind, over-fatigue, prolonged watching, excitement and undue mental strain on anything which will exhaust or irritate the nervous system. If cholera symptoms appear go to bed in airy room. Keep warm and send at once for your doctor. Drink hot lemonade, and if weak take a little old brandy well diluted. Drink one-half pint of the following mixture every morning: Thirty drops diluted sulphuric acid in a half pint of boiled water adding sugar to taste.

PAPER CAR WHEELS.—Of course you notice that a Pullman car is much easier to ride in than one of the ordinary cars. You attribute this to the superior springs, perhaps.

The springs, of course, make a difference, and the springs on a Pullman cost probably ten times as much as the springs of an ordinary car. But in reality the springs are a small matter. It is the wheels that make the great difference in comfort and safety, and Pullman wheels are expensive articles. Every wheel on every Pullman car is made of paper. You do not see the paper, because it is covered with iron and steel. The body of the wheel is a block of paper about four inches thick. Around this is a rim of steel from two to three inches thick. It is this steel rim, of course, which comes in contact with the rails. The sides are covered with circular iron plates, bolted on.

Electricity.

The Electric Welding Process.

In a paper read before the Carriage Builders' National Association, Mr. Frederick P. Rnyce, of Boston, thus describes the electric welding process:

To heat a piece of metal by electricity, the method in practical use is to pass an electrical current having an enormous volume through the piece to be heated. Similarly, if we desire to weld two pieces of metal by electricity, we force through the pieces a current having a volume so great that the metal, on account of its resistance, cannot carry it without rapidly inducing heat. In case the current is forced through the continuous piece of metal, the heat produced is equal throughout; but if we pass the same current through the two pieces of metal touching each other, the resistance is greatest at the point where the two pieces touch, and the heat is necessarily produced there first. Two pieces of metal cannot be brought so closely together that the resistance at the point of contact will be as low as in the solid metal; consequently, the heat is necessarily first produced at this point, and after it is once generated the resistance at this heated point increases, for the reason that hot metal is always a poorer conductor of electricity than cold metal. It is consequently a building process. The ratio of increase of resistance and the increase of heat at the desired point become practically constant. When the metal reaches the desired welding temperature the pieces are forced together by end pressure, and a butt weld is made. This pressure for small sizes of work is supplied by various forms of hand-levers, but in larger welding hydraulic pressure is ordinarily used, the hydraulic cylinders for the purpose being a part of, and attached to, the welding machine. The result of this end pressure is an enlargement or upset of the metal at the point of contact, the size of the upset depending upon the section of the stock welded. This may be removed in various ways, as will be hereafter described.

There are two distinct types of electric welding apparatus for producing the above results. The first machines built were planned for what is known as the direct method of welding; those built later and in more general use to-day are of the indirect type and specially used for larger work. In the former the dynamo and welding apparatus are combined in one machine, the current passing directly from the collector rings of the generator to the piece to be welded. In the indirect type, the dynamo and welder are separate pieces of apparatus. The dynamo is complete in itself, and can be located near the source of power, connected by wires carrying the current generated to the welder, which can be placed in any convenient location for the work to be done, and at a distance of several hundred feet from the dynamo, if necessary. This makes it possible to place the dynamo or generator in an engine-room, or near the source of power, and in charge of the engineer, so that it can be looked after at little or no extra expense. One or more welders can be distributed through the works; and, in localities where there may be no arrangements for power, but where they can be conveniently operated, several welders can be run from one dynamo, and there are already instances where five, six or more welders are placed in different buildings and on different floors, running constantly from a common dynamo and fed from a never-varying pressure. The direct apparatus above referred to is found to be advantageous for small work, as the welding of wire, cotton ties, rims for baby-carriage wheels, etc., and where cleanliness at the point of welding can be observed. For all larger work, however, the indirect apparatus is far preferable. The dynamo is of special construction, and varies materially from that used for lighting purposes, and yet can be so built, if desired, as to furnish current for incandescent lamps needed in the works where the welding plant is placed. The dynamo

generates an alternating current of 300 volts, which is less than one-third of that required for the lowest potential primary circuits used for lighting purposes, where an alternating current is generated.

The welder itself consists chiefly of a transformer or converter, in which the current of electricity generated in the dynamo is changed from one having a reasonably high electro-motive force and varying volume to one having a very low electro-motive force and an exceedingly large volume. This converted current is carried through an electrical circuit made up preferably of massive copper and the pieces which are to be heated for welding. That is to say, we have a circuit which is made up of several feet of heavy copper and a few inches of iron, steel or other metal to be welded, in which the voltage is so low that no shock can possibly be given the operator and no danger whatever can result therefrom. The power of conducting electricity, which the copper possesses, is so high that practically no heat is caused in this metal by the electrical current passing through it, but as the current passes through that part of the circuit, consisting of the pieces to be welded, the resistance through these pieces is so high that a welding heat at the point of junction is quickly secured. This heat is perfectly and absolutely regulated by reactive coils and other forms of apparatus. The work is never hidden from the operator, as is necessarily the case in a forge fire; the necessary pressure can be applied at exactly the right moment, and uniformly good results are obtained. No detrimental foreign matter can be introduced into the weld, as is frequently the case when coal or coke are used, and any impure substance existing in the metal in the immediate vicinity of the weld is ordinarily expelled by this welding process. To illustrate this, it has been frequently shown that if a piece of iron, after being electrically welded, is ground or planed off and etched with acids, the structure of the metal at or near the weld will be closer and finer than in the original bar, and thorough and exhaustive tests made upon the welds show that an absolutely perfect union has taken place. The metal becomes homogeneous at the point of welding.

ELECTRICAL GENERATORS FOR CHEMICAL LABORATORIES.—Discussing the subject of generators in chemical laboratories, the London *Electrician* says: "Primary batteries are out of the question; a thermo-electric battery by itself is not sufficient, but joining it with storage cells a very simple and practical generator is obtained." Such a one is described by Dr. Erbs in the *Chem. Zeitung*. There are eight small accumulators of eight ampere hours each and a Guelcher thermo-electric battery of 66 elements. The accumulators may be grouped in any way desired; a resistance box from two ohms down to 0.1 ohm; a Gaugain galvanometer and a commutator are also provided. The thermo-electric battery is heated by gas and needs no governor. Its mean voltage is 4.1 and its internal resistance is .68 ohm. The gas consumption is 170 to 180 litres per hour; each accumulator contains one positive and two negative plates and about a quart of acid. It has a mean voltage of 2.05, an internal resistance of .05 ohm and a maximum current of three amperes. Work of the most varied character can thus be done. The accumulators are connected in parallel for charging, which can be effected in 30 hours. If kept clean they are said to retain their charge for months. This arrangement is said to have worked very satisfactorily in a laboratory in Freiburg.

LIQUID FUEL.—Another engine fitted with liquid fuel has been running on the Great Eastern Railway, England—one of a class of 10 similar express engines—and, as compared with the other nine engines doing the same round of duty, is reported as doing efficient service, that is, the oil-burner has consumed about one-third the weight of coal per mile and about as much oil as coal in weight, her total fuel being thus about two-thirds by weight what it would be if all coal, and the liquid practically giving an efficiency of double its weight of coal. The engineer's account is interesting in relation to this engine when burning mixtures of plain gas tar and creosote residuals, warmed up in the tank, which is placed at the rear of the tender, to a liquidity sufficient to cause it to flow freely through the injector pipes and to destroy its viscosity so that it would spray finely from the nozzles. Its behavior in the furnace he states to be satisfactory, filling the fire-box with white flame, the air rings also admitting of the most delicate adjustment of the supply of air for effecting combustion without air excess.

Metallurgy and Ores.

SELBY
SMEETING and LEAD CO.,
418 Montgomery St., San Francisco

GOLD AND SILVER REFINERY
And Assay Office.

Highest Prices Paid for Gold, Silver and Lead Ores and Sulphurets.

— MANUFACTURERS OF —
BLUESTONE,
LEAD PIPE,
SHEET LEAD,
SHOT, Etc., Etc.

ALSO MANUFACTURERS OF
Standard Shot-Gun Cartridges.
Under Chamberlin Patent.

JOHN TAYLOR & CO.,
IMPORTERS AND DEALERS IN
ASSAYERS' MATERIALS, MINE
AND MILL SUPPLIES,
ALSO CHEMICALS, AND PHYSICAL, SCHOOL AND
CHEMICAL APPARATUS.

23 & 25 First St., cor. Mission, San Francisco

We would call the attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our full stock of Balances, Furnaces, Muffles, Crucibles, Scorifiers, etc., including, also, a full stock of Chemicals.
Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast, we feel confident from our experience we can well suit the demand for these goods, both as to quality and price.
Agents of the Denver Fire Clay Co. and for the Morgan Crucible Co., Battersea, England. Also for E. G. Denniston's Silver Plated Amalgam Plates. The plates of this well-known manufacturer are thoroughly reliable, and full weight of Silver guaranteed. Orders taken at his lowest prices. Our Illustrated Catalogue and Assay Tables sent free on application.

JOHN TAYLOR & CO.

NEW DISCOVERY.

Mines Revived and Miners Enriched

By the wonderful MacArthur-Forrest Process, Controlled by The Gold and Silver Extraction Mining and Milling Co. H. A. W. Tabor, Pres.; LEONARD GOW, V. Pres.; H. A. JONES, 2d V. Pres.; P. GEO. GOW, Technical Mgr. and Asst. Treas.; T. L. WISWALL, Gen'l Mgr. and Secy.; Peter McCourt, Treas.; W. L. COOPER, Eng.

TRADE MARK.
The Glasgow Works, Glasgow, Scotland, are in London, South Africa, New Zealand, Queensland, Etc.

General Office of Company:
Rumors 8, 9 & 10, Taber Grand Opera House Block, DENVER, COLORADO.

Also mills in operation as follows, viz: The Denver Mill, Denver, Colo.; The Livingstone Gold Mining Co., Boulder Co., Colo.; The Puzzler Gold Mining and Milling Co., Boulder Co., Colo.; The Cripple Creek Gold Extraction and Power Co., Colo.; Calumet Gold Mining Co., Middle Creek, Shasta Co., Cal.; The Shasta Gold Ex. Co., Middle Creek, Shasta Co., Cal.; The Mercur Gold Mining Co., Fairfield, Utah; Champion's Mines, Humboldt District, Yavapai County, Ariz.; The Crowned King and Last Chance Mine, Yavapai Co., Ariz.; The Union Mines, Maricopa Co., Ariz.; The Revenue Con. Gold Mining Co., Revenue via Norris, Mont.; The Crelighton Mining & Milling Co., Crelighton, Cherokee Co., Georgia; and others in course of erection.
The object of this company is to introduce the Mac Arthur-Forrest process.
We have purchased from the Cassel Gold Extraction Co., of Glasgow, Scotland, the exclusive right for the United States to use patents covering this process.
If you desire an experimental test communicate with the secretary.
If the results of the tests are favorable, we will then make arrangements to treat a quantity of not less than five tons at Denver.
We are fully prepared to grant royalties to mine and mill owners, or rights covering districts and counties.
The process consists of pulverizing the ore to a fineness of about 60 mesh, and then subjecting the same to an action of a very diluted solution of cyanide. A few tubs especially constructed according to our diagrams, for triturating, settling and filtering, is all that is required extra in connection with any kind of pulverizing stamps or rolls.
The total cost, as a rule, does not exceed from \$2.50 to \$5.00 per ton.
The most desirable class of ores for this process be so-called refractory gold ores, pyrites, hematites, manganese and tellurium. We have also treated successfully dry alloy ores.
We will be pleased to answer any inquiries and furnish any desired information. Address,
T. L. WISWALL,
P. O. Box 926. Gen. Mgr. and Secretary.

MODELS OF MINING PROPERTY.

THE BLASDEL CONCENTRATING BELT COMPANY.

We are now having our new Improved Concentrating Belt manufactured in San Francisco. We keep always on hand Belts suitable for the Triumph and Frue machines, but can make any length or width desired. The advantages of these belts over any others will be readily seen by practical millmen. First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight rifled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. Those slight rifles also save very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth. We can safely say that it is a better concentrator belt than has ever been manufactured. It will last much longer and will handle more pulp. We also manufacture smooth belts with same flanges when desired.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

MIDDLE BAA.—Amador Record, April 20: Middle Bar, on the Mokelumne river, is now experiencing quite a mining boom. Mr. Pine, on the south side of the river and adjoining the Astoria and Farrel mines, has 15 men on the pay-roll building roads and grading out for a mill-site. Col. Robinson has organized a company of Eastern capitalists and will open up the Gabvanea mine. The Albany and Farrel Companies have bids in for several hundred feet of roadway from the north bank of the river in to their properties. The Hardenburgh folks have cleared their shaft of water and debris and are now sinking below the 600 level. The Littlefield and Astoria tunnels of the Albany mine are being pushed ahead as rapidly as labor and powder will permit. The faces of both tunnels are penetrating stringers of quartz and are nearing the main ledge. The Middle Bar residents are circulating a petition asking that a postoffice be assigned there. The Amador Gold Mining Company (Limited) of London, England, whose property is located in the Jackson district, this county, has recently issued a prospectus outlining a plan for future action and calling a meeting of the directors. Litigation of a complicated character has been pending for some time between the English and American stockholders. We can only hope that everything will be amicably adjusted and work resumed on the property. It is expected that the parties who have the Fagan mine handed will take the property before the expiration of the time next month. Mr. Fagan informs us that he has but little doubt that the sale will be consummated.

PLYMOUTH CO.—Cor. Amador Ledger, April 20: Many of our old superannated cranks are circulating a report that the Plymouth Consolidated Mining Company is going to start the works up again, which is a report without any semblance of truth so far as we can find out. At all events, if the mine does start, it will be at least two years before the works are in a condition to employ a full crew of miners; and, of course, the number of men that are employed and have steady work with good wages is what interests the people here.

BAY STATE.—The boiler at the Bay State gave way Tuesday night, and now the mine is again shut down and filling up with water. The Bay State has had what might be termed a hard time of it, with break-downs, pumps and water during the last few months. Supt. Jones says they have a Jonah somewhere, which, as soon as he is found, will be thrown overboard.

FOREST HOME.—Everything is very quiet. The Thomas-Bothwell hydraulic mine is running about the same. It is the largest hydraulic mine in this section.

GOVER.—The Gover is running along as smoothly as it is possible for a mine to run. They are handling a great deal of water in a 15-hour daily run of their electric pumps. They have just finished sinking to the 1200 level, and are now engaged in sinking a sump and running a drift. At the bottom of the shaft they encountered a rich but small vein, which is widening as they go in.

Calaveras.

COPPER.—Mountain Echo, April 22: It has been reported to us that Bat DeMartine recently struck a rich copper mine near his residence in Bear Mountain. The lead at the surface is about a foot wide and increases in width as depth is attained. The ore is said to be 90 per cent pure, or nearly in its virgin state.

Two men are now working the celebrated Brunner mine on shares and it is said they are doing well. This is one of the best mines in this mining section and time will prove it.

Savvaal miners were overcome by gas in the Stickle mine last Thursday. As soon as the accident was discovered the men were brought to the surface, and Dr. Dorroh was summoned. After considerable effort the men were resuscitated.

El Dorado.

Naw MILL.—Georgetown Gazette, April 20: The new ten-stamp mill now being put up on the French Hill mine near Spanish Dry Diggings will be ready for service in about two months. C. S. Hersey, the millwright, has charge of the work. The mine is owned by E. S. Hadley of Los Angeles, A. J. Johnston of Sacramento, and Geo. M. Odom of Spanish Dry Diggings. If the results prove satisfactory, ten more stamps will be added, as the lode is from 15 to 50 feet in width. The mill will be run by water power obtained from the California Water Company.

PUMPIO OUTFIT.—Amador Ledger, April 20: B. Levaggi has just received from the shop a fine water-wheel and pumping outfit for his claim at Dogtown, El Dorado county, which will be shipped up to the mine by heavy teams as soon as the roads are a little more settled.

Modoc.

WORK PROGRESSING AT HAYDEN HILL.—Adin Argus, April 20: Dan Ambrose was down from Hayden Hill last Saturday and reported work in the Tunneling Company's works progressing nicely and prospects gradually becoming more encouraging. The tunnel, during the past 16 months, has been extended 457 feet by the work of only two men, Mr. Ambrose and Dan McCrane. During the first 14 months' work, a distance of 250 feet was reached, making in all 707 feet. Tunneling is much easier than it has been, as during the month of March 37 feet of tunnel were made. The "Juniper" mine, at one time exceedingly rich and by far the richest mine at

Hayden Hill, is now worked by a company of which W. C. Howard is superintendent. They are at present working on a vein that pays about \$15 to the ton. Nothing of particular interest is reported of the other mines there. People of this valley look with interest to the development of the mining interests, as the prosperity of Hayden Hill means increased prosperity to Big Valley.

Inyo.

NEW MINE.—Inyo Independent, April 21: W. C. Wilson of Mojave has certainly developed a good mine near the south line of the county. The location is near the north side of Indian Wells Valley, about 25 miles northeast from Coyote Hole station. It is in the Argus range, where the chain ends on the edge of the plain. The ledge was well prospected, and the extent and value of the ore determined before anything else was done. From an average sample, Selby & Co. of San Francisco gave Mr. Wilson the following return per ton: Gold, \$134.73; silver, \$14.88; total, \$144.11. A small mill has been erected and is now about ready for work.

Nevada.

FINE GRAVEL.—Nevada Transcript, April 20: To-day the good news comes to us that the Manzanita Gravel Mining Co. yesterday struck a fine-looking body of gravel. Last evening they were in three solid feet of gravel, and as work is progressing the lead increases in size and richness. A number of pans of the gravel which were washed yielded a hundred or more colors, and it is thought that a few days' more work will land them into very rich ground. At no time has the Manzanita looked so well. It is evident that the Manzanita has not got the same channel as the Harmony, as in the former the gravel resembles in color that of the old Live Oak, of a very light color, while in the latter mine it is a bluish color.

MADE A RAISE.—A short time since the Anti-Debris Association, for lack of funds, reduced their spy force down to one man. Those left out in the cold spent their time in growling about not having received their pay, which amounted to several hundred dollars. Yesterday four spies arrived here and immediately left for the upper part of the county. So it is quite evident that the association has bled somebody for money and are enabled to put an additional force upon the trail of the wicked hydraulic miner. We do not believe there is any illegitimate hydraulic mining being done in the county, but the spies are here all the same.

THE MIDNIGHT MINE.—Edwin Tilley and others have bought the Midnight mine, located on Piety Hill, and will begin work right away. This mine has been worked in a small way at different times for many years, and some very rich rock taken from it. It is better known as the George Gray ledge. The new owners propose to go to work in earnest and open up the mine thoroughly. It is believed that a valuable property will be developed there.

CANADA HILL.—Nevada Herald, April 21: One of the most promising mining districts, where strikes are likely to be made this year, is that around Canada Hill and Banner Mountain. There has been a great deal of prospecting going on in that locality during the past year, and in a quiet way, but little being said about it. There are a dozen mines being worked steadily and upward of 40 men have been employed all winter. Old Banner is seamed with gold-bearing ledges, and a great deal of gold has been taken out of them, but we believe there is many a fortune in its rocky sides yet. There are a few mine-owners who are employing men at day's pay, but most of them are working on tribute or prospecting for themselves. It is to be hoped that their patient labor will be rewarded. The Martin Bros. property is said to be about the most likely mine in the neighborhood, though the North Banner is again in good ore and may take a spurt. W. H. Vest is developing the Charonnet property for a Utah company, and several tributaries are taking out rock from other ledges, which will be crushed at custom mills. The persistency and confidence with which this prospecting goes on month after month ought to be sufficient to attract capital to the Canada Hill district.

HAULING ORE.—Grass Valley Telegraph, April 20: For some time past parties have been taking out ore from the Balla Union mine near Allison ranch. Quite a number of loads have been extracted from the ledge, and they are now being hauled to the southern mill. Crashing was begun on the rock yesterday, and it will take several days before the final result of the work is known. The parties expect a pretty fair yield, although the gold in the ore so far is very fine.

WILL BUILD A MILL.—Grass Valley Telegraph, April 16: The Baltic mine is looking very encouraging at present. We are reliably informed that figures and estimates are being made with the view of building a mill. Mr. Hendy, who is here from San Francisco, has been down to look at the property and make estimates. In all probability a five-stamp mill will be immediately erected.

IDAHO-MARYLAND.—The negotiations between the Idaho and Maryland mine have not, as yet, "materialized." There are favorable propositions on both sides and Mr. Edward Coleman informs us that the business will be "wound up" one way or another in a very short time.

THE DABCO DRIFT MINE.—Transcript, April 19: Indications at the Derbec gravel mine give good reasons for believing that a new channel is being approached. Some coarse gold has been found in the new ground now being opened, and more or less gravel, indicating that there is a channel not far away. The old channel from which the company took out so much gold is nearly all worked out. Superintendent Wetzel is pushing the prospecting work and as

soon as the new channel is reached as large a force of men as can be worked to advantage will be put on.

TO RESUME OPERATIONS.—Several years ago a company dug a tunnel through the Rush-creek bend on the South Yuba river, with the intention of working the tailings from the river. The tunnel was mined and two or three runs made, but the results were not satisfactory and work was stopped. George T. Emery, the gentlemen who had charge of the work at that time, is here again and intends to resume operations and give the scheme a more thorough test than before.

THIRTY DOLLARS A PAN.—Saturday last a remarkably rich strike was made in the original Harmony drift gravel mine, which is situated on the Washington ridge about two and a half miles from this city. The strike was made in one of the west drifts and the gravel found is very rich. The first pan prospected yielded \$16 in gold. A handkerchief full of the gravel, weighing about six pounds, panned out \$15, being at the rate of \$250 per pound. Yesterday Superintendent Hothersoll panned out \$30 from one pan of the dirt. The gold is coarse, some of the pieces being as large as a dime, and the gravel is the genuine blue river-gravel, from which is emitted a peculiar odor that is characteristic of most of the gravel found in ancient river channels. The deposit averages from three to five feet in width, and is supposed to extend all the way down the ridge to the Manzanita mine. In this event the Manzanita and West Harmony drift mines have brighter prospects ahead, although both are looking very well at present. C. J. Brand, one of the stockholders, showed us a piece of petrified wood that was taken from the channel where the strike was made, which is about 500 feet below the surface. This is an unusual depth at which to find petrified wood. The petrification is black as charcoal, as though it had been burned, and clinging to it is a crust of gravel in which specks of gold showed plainly. It was underneath this wood that the richest prospect was obtained. The stockholders of the Harmony are jubilant over the rich strike and nobody has any stock for sale now. Everybody is glad of it, as the company has spent lots of money in opening the mine and have had all kinds of obstacles to contend with. We hope this rich gravel will last long enough for all the owners to be made wealthy from it.

OSBORN HILL MINES.—Grass Valley Union, April 22: The Osborn Hill mine has good prospects for future development and work is being progressed rapidly. A new hoisting works is in course of erection and machinery for the mine is on the way from the foundry. The old shaft, which was sunk to a depth of 500 feet, is being retimbered, and they will soon commence to sink from that level. The Conlin mine, also situated on Osborn Hill, is undergoing a change. The mill is being overhauled, and as soon as this is completed work will be commenced underground. Mr. L. P. Goldstone is superintendent of the above-named property.

ANOTHER RICH STRIKE.—Transcript, April 22: Michael Hussey has been prospecting a quartz ledge near his residence, in Willow Valley district, for a few weeks past. He has struck some remarkably rich quartz, which is literally filled with gold, many of the specimens seeming to be at least half gold. Yesterday Mr. Hussey took out rock that is even richer than that taken out when the strike was first made, and indications are that there is considerable more of it within easy reach. The ledge is only four inches wide, and being near the surface is evidently a spur or stringer for a larger ledge. It may prove to be a pocket, as this is characteristic of many small veins of quartz that are found to be unusually rich not far from the surface, but which, when sunk upon to any depth, develop into good-sized ledges of high-grade ore, though not so rich as the pocket portions found above. We trust that Mr. Hussey's present strike, if it is a pocket, will prove to be a good big one, and that the indications will warrant continuing work, with prospects of a good mine being opened. He and his son, John M. Hussey, the schoolteacher, worked a ledge in the same neighborhood several years ago, from which considerable very rich rock was taken, and we presume this recent strike has been made on a portion of the old ledge.

BRUNSWICK MINE.—Union, April 24: Work at the Brunswick mine is going steadily on. The mine is down to a depth of 700 feet, and they are taking out some good-looking rock. The mine keeps ten stamps running all the time. There has been a great deal of water to contend with, and the eight-inch pump on the property is hardly sufficient to pump all the water. About 15 men are employed at the mine and more will be put to work when it is opened up. Mr. W. A. Hawley is superintendent and he is fully capable of managing the mine. The mill is operated by steam and the hoisting apparatus is run by water.

Placer.

GOON MONTHLY YIELD.—Placer Herald, April 22: The Horman gravel mine at Iowa Hill, under the excellent superintendency of Mr. Elliott West, is turning out from \$18,000 to \$24,000 a month. This is not one of the biggest, but it is one of the best mines in the State.

Plumas.

GRANVILLE AND CRESCENT.—Plumas National Bulletin, April 20: The mining outlook of the two communities visited is encouraging. McGill & Standart will soon start their mill at Round Valley. The road from the mine to the mill is now being put in order for hauling ore, of which a large body has been developed, and that which will pay. It is rumored that the firm intend putting up a large mill in North Canyon below the mine. This done, ore can be mined and milled very cheaply. Doubtless this will be one of the most valuable properties

in Plumas. D. McIntyre is preparing to crush ore from his mine at Wolf Creek. He completed a mill last summer and made a short run. A large body of ore is reported, and it prospects well. Firminstone & Richards have been at work for several months past extracting ore from the Phoenix, and they will begin crushing it in a few days. The ledge is reported small but of good quality. In the Crescent mine, 400 feet below the surface, is an immense body of ore, at points nearly 80 feet wide and between well-defined walls, but as yet good pay in it has not been reached. Here is a chance for one of the biggest mines in the State. Should this body of ore develop a pay chimney, it would be a fortune to the company, make an extremely prosperous town of Crescent, inure to the benefit of Indian Valley largely, and scatter money in the county generally.

San Bernardino.

A BIG MINING DEAL.—Riverside Enterprise, April 23: Mr. J. H. Crossman of this city and San Francisco parties have just closed a deal for a group of mines situated in the Dry Lake mining district which is situated on the Mojave desert. The purchase price of the mines in question was \$100,000 and the sale was consummated through the instrumentality of Attorney A. L. Bartlett of this city. The mines in question have all been developed more or less, and sufficient work has been done to show the great value of the mines. Tests of the rock taken from the mines show them all to be rich in gold-bearing ore. The purchase of Mr. Crossman and associates shows ledges varying in width from 2 to 40 feet, and the rock assays from \$3 to several thousand dollars per ton. The location of the mines is accessible to railroad over a good wagon-road, and there is ample water supply to run a large stamp-mill. We were shown specimens of rock from the mines yesterday, and they certainly bear out the claim of Mr. Crossman when he says his company has a bonanza. Mr. Crossman leaves to-day for San Francisco to confer with his associates relative to further development of the mines in question.

Siskiyou.

PROSPECTING.—Yreka Journal, April 26: A party of mining men left Yreka on the 20th, to prospect some quartz ledges situated in Scott Bar district. If found to be as represented, they will without doubt open other properties, and assist in developing the minerals that for want of capital have so long lain idle. The party consists of W. W. Walters, J. B. Fort, J. H. Johnson, J. H. Harney and E. H. Hughes, all representative mining men, who will develop our mines, wherever any prospect of reward is possible. The Empire quartz mine at Empire Creek, Klamath river, begins to look well again, with prospects of a good paying ledge in sight. The enterprising owners have expended a large amount of money in developing it, besides erecting one of the finest quartz mills in the county. A. Ermo has disposed of the old Shores quartz mine in Quartz Valley to Andrew J. Myers the well-known mining expert, consideration \$3000. This is the pioneer quartz mine worked in the Siskiyou, and paid handsomely in the '50 period, by the old crude process of milling. A man named Nielson has found good prospects in Quartz valley, at Douglas Hill. He anticipates developing a rich paying channel of auriferous gravel extending throughout the valley and vicinity. Harry Campbell and Hall have made arrangements to put up an electric plant in lower end of Quartz Valley, for lighting, hoisting and other uses where power is needed, in developing drift diggings of rich paying gravel. The American Bar Co., operating a claim in Klamath river, at Ash Creek, below Hornbrook, is now pushing the work energetically with 25 men employed, and expect to take out considerable gold from now on, or as soon as bedrock is reached. This is one of the best rigged claims on the Klamath, all the machinery being worked by one immense current-wheel over 40 feet wide and 18 feet in diameter.

Shasta.

MULETOWN.—Shasta Courier, April 20:—It is expected that the quartz mines about Old Muletown will make a better showing this year than heretofore, otherwise "hope deferred" will make some people sick and produce a positive kick. The Schroter brothers are taking out very rich rock in the mine a mile north of town. The Drury brothers are also taking out very rich rock in their mine a mile south of town. They are running an arrastre.

Sierra.

CLEAN-UP.—Mt. Messenger, April 22: Wm. Hanley cleaned up about \$2800 for about ten days' work in his drift claim near Alleghany. It is said to be the prettiest gold ever seen in this part of the country. Frank Dunlivan was down from American Hill last Wednesday, and reported that Martin Meehan and son had struck a good prospect in their drift diggings on the north side of the hill. Supt. Robt. Forbes, of the Bald Mt. Extension mine, came over last Sunday and called on us Monday. Work is satisfactorily progressing up there, with over 30 men employed. The depth of snow is about five feet on a level.

NEVADA.

Washoe District.

CON. CAL. & VA. MINE.—Virginia Chronicle, Apr. 21: 1500 level—Have continued to extract ore and old fillings in working upward in the old south stope, from the 10th to the 15th floors above the sill floor of this level. 1600 level—Are repairing the main south drift and the east crosscut leading therefrom to the upraise connecting with the north drift on the 1500 also. 1650 level—Have continued making necessary repairs to the drifts on the sill floor of this level. We continue to extract some ore from the old stopes, eight floors up in the upraise

No. 6 carried up from the main northwest drift; also from the old stopes in working north from the crosscut run west from the northwest drift. From the drift run west from these north workings, 27 feet up, the upraise started 50 feet in from the mouth of the drift, has been carried up 14 feet; total height, 55 feet; the top being in a quartz formation carrying a low assay value. Have continued to stope out ore of fair quality in working on the north and south sides of the drift run east (at a point 20 feet down) from the winze which was sunk from the crosscut run west from the main northwest drift. Have extracted during the week from all parts of the mine 647 cars of ore, about 640 tons. Shipped to Morgan mill 658 1030-2000 tons of ore. Average assay value, per railroad car samples, \$31.18. The assay value per battery sample of all the ore worked at that mill during the week (630 tons), was \$26.97 per ton.

OPHIR.—500 level.—Jointly with Mexican Co. continue doing necessary repair work in the west drift from the main shaft. 1565 level.—The second compartment to the winze which was sunk 52 feet below the sill floor of this level has been carried up from the bottom to the top and is completed. We are now ready to start a crosscut to the west from the bottom of this winze.

MEXICAN.—On the 1565 level.—West crosscut No. 2 from the north drift from the east crosscut from the bottom of the winze, sunk from the 1465 level down to this level near the south boundary, has been extended 21 feet; total length, 152 feet, continuing in a softer porphyry formation carrying clay separations and showing fine lines of quartz. 500 level.—Have continued making necessary repairs, jointly with the Ophir Co., in the west drift from the Ophir shaft on this level.

UTAH.—340 level.—West crosscut No. 3 from the north drift, from west crosscut No. 2, at a point 195 feet in from its mouth, has been extended 14 feet; total length, 107 feet; in quartzite and clay formation of very low assay value.

SIERRA NEVADA.—The intermediate tunnel on Cedar Hill has been advanced during the week 15 feet, making the total length 297 feet; the face is in porphyry. The joint Sierra Nevada and Union west drift, 900 level, has been advanced 22 feet, making the total distance west of the joint shaft 3122 feet; the face is in porphyry and streaks of clay.

UNION SHAFT.—The joint Sierra Nevada and Union west drift, 900 level, has been advanced the past week 22 feet, making the total distance west of the shaft 3122 feet; the face is in porphyry and streaks of clay.

ANDERSON.—On 420 level north drift from east crosscut No. 1 north, advanced 18 feet; total length, 235 feet; formation in face nearly all quartz of very low assay value. This drift is now being turned to the west.

GOULD & CURRY.—200 level.—During the past week west crosscut No. 5, started in north-west drift, 432 feet from main west drift, has been advanced 9 feet; total length, 435 feet; face in porphyry. Sutrö tunnel level.—On this level we are still working to connect the joint north drift with the winze.

BEST & BELCHER.—200 level.—At a point in northwest drift, 230 feet from our south line, started west crosscut No. 2 and advanced same 20 feet, passing through porphyry, clay and quartz. 900 level.—The south-west drift started in west crosscut No. 3, 20 feet from top of upraise No. 1, 1000 level, has been extended 12 feet through porphyry and small stringers of quartz; total length, 112 feet. Also did some repairing on this level during the week. Sutrö tunnel level.—On this level we are still working to make the connection between our joint north drift and the Gould & Curry winze.

HALE & NOBECROSS.—In the main shaft have finished easing the timbers between the 900 and 1100 levels. Main Incline.—We continue making the necessary repairs. 1800 level.—Advanced west crosscut on our south boundary 22 feet; total length, 110 feet; face in porphyry and quartz. During the week have been repairing the main north drift on this level where necessary.

CHOLLAR.—Are repairing north drift, 450 level. We have completed retimbering the two north compartments of the main shaft above the 930 level. The east crosscut near south line, 930 level, is out 129 feet; face is in porphyry and seams of quartz.

POTOSI.—The east crosscut No. 3, 850 level, is out 365 feet, having passed through some streaks of quartz giving low assays. The upraise 75 feet south of Potosi winze, 930 level, is up 21 feet, showing a streak of fair-grade ore on the footwall, about 12 inches wide. The west crosscut from north drift, 250 feet east of Potosi winze, 930 level, is out 63 feet, the face of which shows four feet in width of fair-grade ore. Are putting square sets north and south from the top of raise, 1000 level. Extracted and sent to mill the past week 492 tons and 1250 pounds of ore from the 550, 930, 1000 and 1150 levels. Milled during the week 450 tons. On hand at mill, 127 tons and 750 pounds. Average battery assays, \$21.86; average car sample assays, \$23.53.

OCCIDENTAL.—The main north drift on the 750 level has been extended 10 feet; total length, 731 feet; face is in hard porphyry. The upraise above No. 2 winze in south drift, 750 level, is up 113 feet; the top shows two and a half feet of pay ore. The Zadig drift, Sutrö tunnel level, is in 931 feet; face in hard porphyry.

WARD SHAFT.—Are retimbering the shaft 20 feet from the surface.

EXCHERQUE.—Are yet engaged retimbering the Ward shaft.

KENTUCK.—We continue to extract from two to three tons of ore per day from the 160 level of the average value of \$31 per ton. The

east crosscut on line between Jacket end Kentuck, 1100 level, is in 11 feet and shows fair-grade ore. Have continued the main south drift south into Kentuck ground, end are timbering and preparing to stope ore for the mill.

ALPHA.—Are yet engaged retimbering the Ward shaft.

BULLION.—Are yet engaged in retimbering the Ward shaft.

APEX.—In the past week have been timbering winze; to be completed to-morrow.

SILVER HILL.—The southeast drift on the 450 level has been advanced 5 feet during the past week, making the total distance from north line, 98 feet, the face is in hard porphyry.

CON. NEW YORK.—The south drift from the bottom of the winze below the 650 level is in a distance of 20 feet; the face is in quartz, some of which gives fair assays. The south drift from No. 4 west crosscut, 800 level, is in a distance of 30 feet; formation, quartz and porphyry.

Alum Creek District.

GOLD.—Walker Lake Bulletin, April 16: Henderson & Hatton have recently made some very promising gold locations in Alum Creek district.

Cortez District.

ORE IN THE TUNNEL.—Central Nevada, April 21: S. Wenhan, managing director of the Cortez mines (limited), and Wm. B. Shaw were in town yesterday, returning from a trip of inspection to the Cortez property. They report the mines in first-class condition, some very important ore bodies having been struck in driving the main tunnel during the winter. The Cortez mines (limited) can produce bullion at a less expense than any other silver property in the State. Why? Because of the extensive ore reserves, convenience for fuel, cheap manner of reduction of the ores, careful and economical management. Look out for a boom at Cortez in the near future!

Ferguson District.

A RICH DISTRICT.—Salt Lake Mining Journal, April 24: A. H. Godbe, secretary and metallurgist of Bullionville, Nev., Mining & Reduction Company, paid the Journal a pleasant call this morning. We have made frequent mention of these works in our columns, and are gratified to learn that the system of reduction used by the company is giving very satisfactory results; so much so, in fact, that the capacity of the plant has been enlarged so that the company can treat the milling ores of Lincoln county, as well as the large dump of tailings, for the reduction of which their works were originally put in. Mr. Godbe has great faith in the future of Ferguson district, the home of the Magnolia and April Fool mines, and believes that this season will demonstrate that this district has a wealth of mineral. On the question of railroads, he is also sanguine, and predicts that inside of two years the mineral output of that region will be sent to market behind the iron horse.

Kennedy District.

EXCELLENT OUTLOOK.—Cor. Silver State, April 19: There are without doubt a number of very valuable ledges here which only want proper development to become remunerative properties. A few days ago Mr. Kennedy pounded out in a hand mortar a few pounds of ore taken from one of his mines, and I was greatly surprised at the amount of free gold this rock yielded. These mines are no longer an experiment. They have been so thoroughly tested by the milling of ores to make their value a safety. Mr. Charles E. Kennedy, the discoverer of the mines, is a thorough-going miner. He erected a large arrastre, in which he worked a number of tons of ore, which, although imperfect and saving only a portion of the valuable metals, yielded in the neighborhood of \$80 a ton in gold and about \$30 in silver. Not yet satisfied with this showing, the company, which is composed of Kennedy, Benton & Wilkinson, made a shipment last fall of several carloads of ore to Portland, Oregon, which was worked and made an average yield of \$80 a ton in gold and \$35 in silver. This thorough test at once permanently established the value of the mines, and the company went to work in earnest to develop them, and has several tunnels run along the ledges, varying in length from 100 to 400 feet, and ore taken from the ledge in all of these tunnels shows the same uniform richness. The ledge varies in thickness from one to four feet, its average being about three feet. The company now has three carloads of ore ready for shipment, which is all high grade, and from which it expects to realize enough to erect a small mill. The company has a large amount of second-class ore, which will pay from \$25 to \$40 a ton. This ore will not pay for shipment, but with a mill on the ground will yield a handsome profit. The company has just completed a wagon road to the mine and will commence hauling the ore to Winnemucca in a few days. There are about 100 claims located in the district, with about 15 or 18 open and under the course of development, all showing the same flattering results. The hills seem to be full of good ledges, and the man who comes to this district early will be fortunate, for such mines as this district is developing are not to be found every day. There is a grand opening here for some man to put up a custom mill, as there is enough ore now mined to give a mill steady work. Mr. William Wilkinson, an experienced miner, who has spent many years in the mines of the State, says he has never seen so many good ledges or a more flattering prospect for a large and valuable district. This morning, Lervier, Dwire & Co., of the Midas ledge, have taken out of their mine some very fine ore, which assays \$140 a ton in gold and is rich in silver, and they are highly elated with the prospect. There is an abundance of good water here, and Kennedy & Co. have secured the water right. In fact, with

a reservoir to hold the water, a supply sufficient to run a five-stamp mill six or eight months in the year could be had. However, there is plenty of timber in the vicinity to supply fuel for several mills. It is only a question of a short time when the value of these mines will attract capital, and I would not be surprised to see one of the biggest mining camps in the State spring up here this season, for the gold is here and it is only necessary to develop these mines to get it.

Marietta District.

RESUMPTION OF ACTIVITY.—Walker Lake Bulletin, April 19: Mr. Turner, of Marietta, was in town last Saturday. From him we learn that there is likely to be a resumption of activity in that camp. The Eagle mine, the property of Messrs. Pexson, Phipps and Turner, is said to be very valuable. The ledge is three feet wide and the ore averages \$20, which is said to be a low estimate. The owners have already 150 tons on the dump, and the work so far done demonstrates that the ledge is permanent. While in town Mr. Turner purchased the Endowment mill, which is four miles from the Eagle mine, and as soon as the mill can be put in shape, five stamps will be started on the first crushing. Mr. Turner is now in Mason valley to buy a team and wagons with which to haul the ore from the mine. The owners are going to work in a business-like and systematic manner, and there is no doubt that they will show up a fine property. It is also their intention in the near future to erect smelting works for the accommodation of the silver-lead mines of the district.

Tuscarora District.

NAVAJO.—Times-Review, April 21: No change in any of the workings. The stopes above the 350-foot level and 150-foot level are producing the usual output of ore.

BELLE ISLE.—Work has been confined to stoping above the 250-foot level. The stopes are without change and producing as usual.

ARIZONA.

TURKEY CREEK.—Prescott Courier, April 22: Mike Ryan is in from Turkey Creek. He reports having run through twenty-six tons of free gold ore from the Morning Glory mine, which proved satisfactory. Walter Wright, lately returned from Colorado, is in charge of the mill at which the ore was worked. The mill is known as the old Henzey mill, and Mr. Wright is said to be running satisfactorily on custom ore.

MINT.—J. M. Daly, of Minnehaha Flat, is at present running his arrastre on ore from the Mint mine, which averages from \$50 to \$100 per ton in free gold. He also owns the Florence mine, shipments of which went from 90 to 110 ounces per ton; but, owing to the present low price of silver, nothing is being done with this mine at present. The vein is from 12 inches to 2 feet in width.

MACHINERY.—Messrs. Stockton and Schultz, two mill men and machinists from Pueblo, Colorado, came in on Saturday evening's train. They are here for the express purpose, the Courier is told, to erect the machinery for the Bursen smelter, on Banning creek, and the quartz mill on the Jennings' group, Hassayampa district. They report that the machinery has been delayed on the road. J. H. Cordes and Ed. Duran own a very promising group of gold mines in the vicinity of Badger Springs. Two of these claims are undeveloped; two of them are sufficiently developed to show strong and well-defined ledges. One of the ledges is from 8 inches to 1 foot wide, the ore going \$50 per ton, gold. The ore from both contains about ten per cent copper. Plenty of water near by to run a mill by water power.

A VALUABLE GROUP OF MINES.—Tucson Enterprise, April 22: The Cleveland parties who recently purchased J. C. Johnson's group of mines in the newly formed mining district of Hiland in this county, have nearly completed their arrangements for incorporation, and are now expecting the articles from Phoenix. The new incorporation will be known as the Columbia Gold Mining and Milling Co., and Mr. Johnson will be its general manager. The group of mines is very valuable gold-bearing ore in slate and porphyry, the principal one of which, the Columbia, shows up an ore body from 3 to 10 feet wide, the ledge of which has been traced for more than 4500 feet. The average amount per ton will run from \$25 to \$30. Some of the ore however, is a great deal richer, as for instance that of the Morning Star, which runs very high. A good deal of work has been done on the group, and it justified the Columbia Gold Mining and Milling Co. in ordering the immediate erection of a 20-stamp mill and other works. The lumber has already been ordered for boarding houses and a store, which shows that they mean to prosecute the delving for the precious mineral with energy and at once. The mines are about eighty miles below Quijotoa, within five miles of the Sonora line, and the nearest railroad station to them is Gila Bend, from where a good wagon road leads to the Columbia. Wood and water are in plenty, and the outlook is extremely favorable for the new corporation.

RICHMOND BASIN.—Arizona Silver Belt, April 26: Joe Brewster was in from Richmond Basin on Tuesday. He reported mining as rather quiet in the Basin. Knickerherry & Lensberg, owners of the Bland claim, on which the rich nuggets of silver were recently found, are now prospecting the ledge, which is a well defined blanket ledge, and believed to be the same from which Henry Risbridge, years ago, got his big pocket of ore, which yielded about \$12,000.

OREGON.

RICH GOLD STRIKE.—An Associated Press dispatch of April 20th says: The tension of quartz-mining excitement in these parts, already pretty high, was increased a little to-day by reliable

news telling of a remarkable strike in the Willow Springs precinct near the old postoffice. The lucky prospector's name is Jacob Hirschberger, and so rich is the vein that yesterday morning he took out rock enough streaked with gold to easily bring a thousand dollars, and it is estimated that he has taken out no less than \$2500 since finding the vein a day or two ago. One remarkable thing about the find is that the vein was discovered right on the old overland stage-road and only 200 yards from the Willows Springs stage station, where, before the railroad's advent in this valley, all overland passengers on the old Oregon & California stage line waited while a change of horses was made. Several other strikes in the same vicinity have been made lately, and the hills are filled with industrious prospectors. The excitement has not been so intense in mining matters since the palmy days of old, when there was scarcely any other industry than mining in this section. At the Hammersly ledge near Jinnpoff Joe, men are reported as hammering out \$20 to \$40 per day per man with an old historic hand mortar. Mining strikes in this country lately have brought many mining men and capitalists from the outside to look over the country, and much outside capital will be at work developing the promising properties soon. A special dispatch to the San Francisco Examiner dated Central Point, April 25th, gives the following additional information: The richest gold strike in southern Oregon since the days of 1852 has been made within two miles of this place in the last week. The entire country is wild with excitement, and, if the present exodus to the hills continues, the town will be depopulated before the end of the week. Your correspondent to-day visited the scene of the Hirschberger strike. The rich pay streak continues to grow richer, and they are taking out gold in fabulous quantities. Within two hours this morning, more than \$500 in coarse gold was taken from the ledge. This mine is in the famous Willow Springs district, which has a gold-producing history dating back to 1852. Within a radius of one mile from the Hirschberger claim, no less than six rich pockets are being worked, from \$50 to \$200 being taken out each day by a single miner. One ledge contains pay streaks showing pieces of gold as large as a pea. The main body of the lode is free-milling rock that will run \$300 to the ton. Several thousand dollars will be taken from each pocket. The soil from the surface of all the ledges is filled with coarse gold, and is being sacked and stored. The excitement has reached neighboring towns, and prospectors are coming in on each train. It is estimated a million dollars' worth of gold is in sight in the Willow Springs district to-day.

THE GOON PROSPECTS.—Jacksonville Times, April 22d: Few people in this section realize the interest taken in southern Oregon mines abroad, and the great wave of mining immigration and excitement about to sweep over this valley. In Idaho miners report little else is talked about except the mineral resources and prospects of Jackson and Josephine counties, and ever since the recent shooting scrape in the latter, over the right to work a mine which has hundreds of equals in our section, the interest is growing rapidly. Even in Colorado the miners are contemplating a rush to this section. There will be many rich quartz pockets struck during the next six months, and quite a number of fine ledges uncovered. Southern Oregon has waited long, but her day has come. W. E. Jacobs has gone to San Francisco to have the rich ore which he and E. K. Anderson brought from D. Horn, at the time he sold the Last Chance mine, reduced or sold for specimens. It is so rich that the jewelers offer to take the whole lot for specimens, at almost the valuation of its weight in gold. When the jeweler's saw shaves off the specimen the flakes of gold shine like stars in the rock, making the richest ornaments conceivable. The ore now being taken from the mine is also very rich, and a carload of it will be taken to the smelters below.

UTAH.

SILVER KING.—Park Record, April 22d: The writer was reliably informed this week that the Silver King mine, with the developments of the past few months, has developed into one of the largest and richest mines in the camp, not barring even the famous Ontario and Daly properties. The vein has developed into a true fissure, is strong and loaded from wall to wall with high grade ore. The mine is proving a surprise to even the most sanguine of its owners, and considering the great demand for that class of ores, and the most excellent facilities of the property for ore extraction, the future of the property is indeed promising. After allowing reasonable amount of enthusiasm on the part of those who were expatiating upon the value of recent developments, it is safe to say that the King is one of the Park's future heavy and rich producers.

CRESCENT.—Preparations are being made at the Crescent mine to keep ore extractions up to the demands of the tramway and mill, and a vigorous summer's work may be looked for from that property. The Kansas City smelters, which have a contract for all Crescent ores are getting quite impatient for shipments to begin, as the ore is badly needed for fluxing purposes. The Anchor ore bins are full to overflowing and the local officers of the company are beginning to chafe over the fearful condition of the roads, which entirely prohibits hauling. The demand for fluxing ores and the favorable prices on lead would enable the company to make a good profit on its production.

SAMPLE MILL.—Work on the new sampling mill is being crowded on as rapidly as men and money can do it, a force of over fifty men being employed. Mr. Mackintosh is anxious to get the mill ready for work as soon as possible, feeling that the summer is going to be an active one in spite of the present gloomy outlook.

Market Reports.

The Markets.

SAN FRANCISCO, April 27, 1893.

It is a significant fact that President Cleveland has decided to ask the late delegates to the International Conference at Brussels to continue in that capacity at the May meeting. He will, however, consult with them and request them to formulate a definite proposal for the conference. While the President thus shows no disposition to interfere in this particular with the work begun by his predecessor, it cannot be said that he has modified his attitude toward silver. His recent utterance that treasury notes must be paid in gold is an adherence to his former utterances. What he may be compelled to do by circumstances is yet to be developed.

Treasury Notes.

The notes issued in payment for the silver bullion purchased from month to month have come in for a good deal of attention of late. These notes are redeemable in gold, silver or greenbacks at the option of the Government, and they are receivable for all dues. Redemption of these notes by the Government since July 1, 1892, has been as follows:

July.....	\$ 108,900
August.....	5,119,000
September.....	1,759,000
October.....	224,200
November.....	220,000
December.....	4,336,900
January.....	4,438,900
February.....	4,000,000
March.....	4,000,000
Total.....	\$29,106,900

The Government has the right to reissue the notes, and the net redemption for the above period is not easily determined.

METALS.—No important change has occurred in the metals during the week. Copper is weaker. Lead and tin are quiet.

Mining Share Market.

There has been rather a strong and active market in stocks during the past week and considerable business has been done. The movement commenced rather suddenly and has kept up well. A number of brokers' clerks had been notified that after May 1st their services would not be needed, but business has improved so that instead of fewer more clerks will be needed. On Monday over 52,000 shares of Comstocks changed hands. This should be very encouraging not only to brokers but to those who still pin their faith to the old lode. Doubtless if management of the properties was such as to inspire more confidence on the part of the public there would be more business. In another column is an article on this subject showing some improvement in the mining methods.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING APRIL 18, 1893.

495,577.—WEENOH—J. A. Barker, Pasadena, Cal.	
495,876.—STAMP-MILL GUIDE—W. H. Brown, Angels, Cal.	
495,580.—CAR-COUPLING—J. E. Catterson, Dayton, Wash.	
495,783.—BEAM AND GIERE SUPPORT—F. Cavallaro, San Jose, Cal.	
495,622.—STEEERING MECHANISM—J. Christensen, S. F.	
495,623.—STEEERING MECHANISM—J. Christensen, S. F.	
495,784.—PEN AND PENCIL HOLDER—A. W. Coffin, S. F.	
495,880.—RAILWAY CAR STOVE—Mary E. Cook, Amity, Or.	
495,727.—SHIP'S PROPELLER—A. T. Elford, S. F.	
495,582.—GROUND GENERATOR OF ELECTRICITY—M. Emme, Oakland, Cal.	
495,792.—WATERING CART—H. E. Fairman, Bakersfield, Cal.	
495,794.—BEET-CULTIVATOR—W. V. Gaffey, Castroville, Cal.	
495,795.—CONCENTRATING BELT—Geo. Gates, Jackson, Cal.	
495,796.—EEO-POACHER—Clara T. Gott, Seattle, Wash.	
495,803.—HULLER & SCOURER—A. F. Hinz, S. F.	
495,945.—POTATO GRADEE AND SEPARATOR—A. J. McDonough, S. F.	
495,750.—WINDOW-HANGER—B. D. McEachren, S. F.	
495,825.—FIELD AND LAWN MOWER—D. M. Miller, Fairfield, Cal.	
495,829.—STEAM BOILER—L. A. Olsen, Oakland, Cal.	
495,639.—BEEHIVE-LOADING GUN—G. A. Sachs, Eugene, Or.	
495,843.—CAELE GRIP—H. A. Shipp, Atwater, Cal.	
495,860.—FRUIT-PITTEE—E. A. Weare, Selma, Cal.	

The following brief list by telegraph, for April 25, will appear more complete on receipt of mail advices:

California—John T. Burt, Tree Pines, wheel for single-track railways; Syron O. Clark, Pasadena, irrigation systems; Daniel F. Donegan, Los Angeles, re-matry; Daniel H. Faust, Stockton, vehicle wrench; Mattie L. Farrington, San Francisco, tap and faucet; Charles E. Hamilton, Los Angeles, assignor of one-half to A. C. Harper, university double-lap pipe; Benjamin Holt, Stockton, traveling harvester; Benjamin F. Howard, Sheep Ranch, lubricator; Frank W. Kringel,

Los Angeles, repeating action for upright pianofortes; Ogden Mallory, Auburn, trace buckle; Ralph Mazza, San Leandro, pencil-holder and sharpener; Thomas Merrill, Oakland, automatic car-ventilator; Alden W. Sanborn, San Francisco, axle lubricator; Edwin G. Smith and E. B. Brown, San Francisco, smelting furnace; William B. Ward, Los Angeles, stone molding and surfacing machine; Christopher H. Watson, Riverside, water gate.

Washington—Lucian F. Cook, two patents, elevated friction cable railway and elevated railway system; George T. Duncan, Tacoma, chin rest for horses; Peter Murray, Seattle, preserving timber; Albert P. Veneer, Seattle, musical instrument.

Note.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible by mail for telegraphic order. American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

EXPLOSIVE ENGINE.—Frank F. Tremper, S. F., assignor to the Safety Vapor Engine Co. of New Jersey. No. 495,281. Dated April 11, 1893. This invention relates to the class of explosive engines and consists in the novel device for producing the spark by which the explosion is effected, and in the novel controlling valve for the cylinder. Heretofore in this class of engines it has been found very difficult to maintain the temper of whatever spring may be used either forming the electrode itself or controlling said electrode otherwise, because the heat very soon weakens and destroys it; but in this inventor's construction the spring, being located well within the piston, is removed from the influence of the heat, and this removal can be carried to any extent which experience may find necessary by simply increasing the length of the parts in order to locate the spring as far within the body of the piston as may be necessary to effect its complete isolation. The chief improvement consists in seating the valve directly and flat against the cylinder, either on its side or on its head, and in making the ports which the valve controls in the cylinder or its head. This arrangement avoids any open chamber in the valve chest, and, in reality, makes of the chest a kind of carrier for the valve stem and exhaust and gas connections outside. There are also other improvements in details of construction.

GAS COMPRESSOR.—E. Lawson, San Francisco. No. 495,348. Dated April 11, 1893. This invention has for its object the compression of gases, and is especially useful for compressing the vapors of ammonia or other similar medium as used in cooling or ice-making machines. It consists of stationary and movable cylinders and piston so arranged with relation to each other that the gas or vapor is first drawn into the larger outer cylinder and compressed from that into a second concentric interior cylinder of smaller diameter, and from this again into a third still smaller stationary concentric cylinder fixed to the same crown or cap with the outer cylinder. The main piston and intermediate cylinder are caused to reciprocate within the outer cylinder and outside the smallest one by means of a piston rod with which they are connected. Suitable passages and valves provide for the transmission of the vapor from one cylinder to another and thence to the receiver. A peculiar arrangement of ducts serves to convey a lubricant to each of the frictional surfaces from a common source of supply.

COMBINED HULLER AND SCOURER.—A. F. Hinz, S. F. No. 495,803. Dated April 13, 1893. The invention relates to the general class of hulling and scouring machines for mill stock. It consists of a combined huller and scourer, the essential features of which are a horizontally disposed opposing stone and runner and alternating sections of stone and screen encircling the periphery of the runner. The object of the machine is to provide a simple and effective machine which will both hull and scour.

NOTICE OF ASSESSMENT.

GOULD AND CURRY SILVER MINING COMPANY.
Location of principal place of business, San Francisco, California. Location of works, Virginia, Storey County, Nevada.
Notice is hereby given, that at a meeting of the Board of Trustees, held on the 11th day of April, 1893, an assessment, (No. 71) of Twenty-five Cents (25c) per share, was levied upon the capital stock of the corporation payable immediately in United States gold coin, to the Secretary, at the office of the Company, Room 69 Nevada Block, 309 Montgomery street, San Francisco, California.
Any stock upon which this assessment shall remain unpaid on the 15th day of May, 1893, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 6th day of June, 1893, to pay the delinquent assessment, together with the cost of advertising and expenses of sale.
By order of the Board of Trustees.
ALFRED D. DURBROW, Secretary
Office—No. 69 Nevada Block, 309 Montgomery street, San Francisco, California.

Work=Shop Companion

480 Pages Solidly Bound in Cloth

For Architects, Contractors, Engineers, Foremen, Railway men, Machinery makers, Jobbers, Salesmen, for Superintendents of Factories, Bookkeepers, and Accountants.

This Compendium, having had many years experience in the mechanical arts, are enabled to judge correctly what is wanted for this class of people's book eaters.

An Exhaustive Instruction for Shop Office, and for Young Mechanics desirous of becoming perfect in their trades. Contains 498 Tables relating to metals, wood, and stone; 218 Rules to solve all mechanical difficulties. The Electrical Department, by a well-known Expert, is thorough and comprehensive. Prices, \$2.50. Special terms will be given to live agents. Apply now. LAIRD & LEE, Chicago.

FRUE ORE CONCENTRATOR

OVER 3200 IN ACTUAL USE.

Manufactured under Patents of April 27, 1880; September 18, 1883; July 24, 1888; and March 31, 1891.

SAN JACINTO ESTATE, LIMITED,
Office of General Manager,
P. O. Address, South Riverside, San Bernardino Co., Cal.
CALICO, Dec. 18, 1891.

MESSRS. ADAMS & CARTER, 132 Market Street, San Francisco, Cal.—GENTLEMEN: After a continuous trial of different concentrators comprising the Frue Vanner, the "Holland," "Paradox," "Triumph" and the "Woodbury" concentrators, extending over several months, we find that we prefer the Frue Vanner, as it is easier of adjustment, runs smoother, has less wear and tear, and—having a positive travel—gives less trouble than the other more complicated and ever changing machines now in use here. The Frue Vanner not only saves cleaner concentrate, but has less loss in the tailings, and is in several ways preferable to the other concentrators here.
I am, my Dear Sirs, Yours faithfully,
S. HARRIS, Manager

THE HEINE SAFETY BOILER.

ELECTRIC
LIGHTING
AND
ELECTRIC ROAD
MACHINERY.

"Figures Can't Lie."—No, but they'll fool you; boiler figures especially, unless you are a boiler expert. "Heating surface," "grate surface," "heat units," "stack areas," "combustion," "draft," "evaporation," problems of all sorts, theoretical and practical, all essential and all calculated to puzzle the elect when manipulated by an expert. Not one steam user in a hundred can be posted on these important points, though they concern his pocket-book directly. What's to be done? What does any sensible man do when he buys a machine he does not understand? What would YOU do? Go it blind, or ask some one who knows, come one whose business it is to know? No sir, you are wrong. We do NOT mean "Ask the Heine Boiler Company, for instance, about boilers." We would advise you to ask our customers. We're interested. We have boilers to sell, and besides you will hear just as good accounts of the HEINE BOILER from them as we could give you. That's why we're frank. Candor is a great virtue, when you can afford it. But seriously now, there's all the difference in the world in boilers, and the difference means a great many large round dollars to the steam user. A man can shovel a lot of money under a boiler in the course of a year's time, and the items of fuel and repairs are of such importance to large steam users that they have had to consult competent engineers, and make careful tests of different boilers to discover what types are most economical. As the result, our boilers have been chosen by many

of the largest and best posted steam users of the country. We wish to call your attention to the character of our customers. That is our best advertisement, and it has been a paying one. We cut the list very short, but it will show you the kind of business that has come to us through our efforts to build boilers that will be FUEL SAVERS, rather than boilers that can be SOLD CHEAP.

THESE ARE OUR BANNER SALESMEN:

WORLD'S COLUMBIAN EXPOSITION..... One-third total power plant.
PENNSYLVANIA R. R. CO., in various plants..... 16 Boilers, 5000 H. P.
BROADWAY & 7th AVE. N.Y., New York..... 18 Boilers, 4500 H. P.
CHICAGO EDISON CO., Chicago..... 12 Boilers, 4400 H. P.

ANHEUSER-BUSCH BREWING ASS'N, St. Louis..... 11 Boilers, 3000 H. P.
J. DEMIER SUGAR PLANTATION, Cuba..... 8 Boilers, 2200 H. P.

A Hydraulic Mine at Work.

The cut on this page gives a bird's-eye view of a hydraulic mine and its surroundings. It was made from a photograph taken from the high ridge on the opposite side of the river from the mine and gives a very good general idea of the appearance of a typical mine of this character. The gravel banks on which the giants are shown at work are seventy to eighty feet high. Cuts

about forty feet deep are made in the bedrock for the sluices, and through these the gravel is washed, the gold being retained in the sluices and the debris passing to the dump on the river bank. This particular mine is on the Trinity river, a tributary of the Klamath, and as both of these are non-navigable streams no damage is done by the debris. The winter floods in the river carry off most of the debris deposited below the mine, so that there is always plenty of dumping ground. In some parts of the claim, not shown in the engraving, the waste material falls 50 to 100 feet over the edge of the bedrock cut, into the river. The 2,000 inches of water is brought through a ditch 10 miles long. The pipe-line begins on the high ridge shown in the foreground, and is led down the very steep mountain side and below the main one shown, which is a suspension bridge. The bridge alone cost \$30,000. The pipe then extends across, as shown, to the branches on the claim.

The mine shown is one of the claims belonging to the Hayes Red Hill property, near Junction City, Trinity county. The belt of gravel extends for miles along the river, and there are mines on both sides. There are other claims both above and below the main one shown, which are also worked by the same owner. The surface of this ground is utilized for farming purposes, and an orchard, there being plenty of water for irrigation.

There is nothing specially distinctive about this mine as far as appearance goes, though it is particularly well equipped, having among other things about a dozen giants, some of 11-inch diameter. The ground is rich and produc-

tive. The cultivated patches shown toward the front of the picture are over a bed of gravel which, though shallow, is exceptionally rich and will some day be hydraulicked off. Both mining and farming are carried on at the same time at Red Hill. The hydraulic mines in Trinity county, as well as those in Siskiyou, are fortunate in being in a drainage basin not connected with the Sacramento or San Joaquin rivers and are, therefore, free from the effect of any laws which control the gravel mines in those sections. There

The California Mining Exhibit at Chicago.

Telegraphic advices from the World's Fair are not specially encouraging with reference to some of the exhibits from California. The criticism on the mining exhibit implies inferiority, which was expected by those in this city who knew anything about the way it was being managed here. There was only a spasmodic attempt to make any collection outside of that furnished by the State

Mining Bureau, and the superintendent of the exhibit did scarcely any active work at all. The main reliance was placed on the collection of the Mining Bureau. While this in itself is good as far as it goes, a very much larger one and more diversified could easily have been obtained had there been an active, energetic man in charge of the whole department. As it is, most of the funds set aside by the State Commission for the mining exhibit will be expended in salaries. The exhibit of gold ores is said to be inferior, and the general make our exhibit is far excelled by New South Wales and by Colorado. The University of California has a magnificent collection of ores, rocks and minerals, part of which might have been obtained for the display, since they all belong to the State. In fact contributions from private individuals would have been abundant had there been any systematic effort to obtain them. There were several enthusiastic workers who endeavored to obtain employment under the commission to do this collecting, but they received no encouragement, and it was left to a few men with little interest beyond drawing their salaries. That the business was not properly attended to is evident from the criticisms in the public press, but this is no surprise to the mining men in this city. There was a magnificent opportunity to advertise the mining industry of California which has been neglected by those employed to attend to it.

BIRD'S-EYE VIEW OF A HYDRAULIC MINING CLAIM.

are no navigable rivers and no farming interests to be injured, so the debris takes care of itself as best it may. The Caminetti law does not apply to this northwestern portion of the State. The mines up there have never been closed down and probably never will be as far as any debris question is concerned.

THE Columbia Marble Mills, Tuolumne county, are now rushed day and night, running two shifts of nine men. One contract is for 5500 tiles for roofing the New City Hall in San Francisco. The saws and machinery are run by water power. The mountain of marble at the quarries is of superior quality, hard, durable, and susceptible of exquisite polish.

THE coinage of gold and silver at the United States Mint, in this city, for the month of April was as follows: Double eagles, \$540,000; eagles, \$290,000; half-eagles, \$440,000; dimes, \$40,000; total, \$1,310,000.

THE mill and pumps of the Lily mine, north of the San Joaquin river, not far from Fresno was burned on Monday. The mill was owned by the McDonald Bros.

Hydraulic Mining Laws and Decisions.

Considerable space is devoted in the MINING AND SCIENTIFIC PRESS of this week to the laws relating to the hydraulic mining industry in California. We give in full the new United States law, best known as the Caminetti Act, the new amendment to the California code, and the new law creating a California State Debris Commission. There is also published in full the last decision of the U. S. Circuit Court in the North Bloomfield case, in which that mine, having shown that it has successful restraining works, is permitted to continue to mine.

It will repay any one interested in a hydraulic mine in California to read carefully this number of the PRESS and then file it away for reference, since whatever legal questions come up in the operation of such mines, these acts and decisions will be found to have some bearing. Hydraulic mines worked in this State, hereafter, will do so under the Caminetti law, the penalty clause in which went into full operation on Monday of this week.

Whatever difference of opinion there may be as to the result of this law on the hydraulic mining industry, it certainly legalizes it. There are conditions and restrictions it is true, but these conditions and restrictions being complied with the miner can work without reference to the opinions of the local courts, anti-debris associations, or so-called "watchmen." In other words there is a way to conduct the business legally, whereas before the passage of the law it could not be conducted at all without being subject to injunction and other troubles at the hands of the enemies of the industry. If a miner now hydraulics illegally he will be punished by fine and imprisonment; but if his enemies interfere with his restraining works they subject themselves to the same penalties.

There are doubtless certain mines upon which it will not pay to erect impounding works; but as these mines could not be legally worked before they are no worse off now than then. Moreover, the new law provides measures by which groups of mines in certain drainage basins may combine in joint restraining works, each paying its proportionate share.

With regard to the new law it may be said that the miners consider that there are too many restrictions and the anti-debris people think there are not enough. It is proper to state, however, that while the largest hydraulic mining companies in the State were opposed to the final passage of the law, some of them already see the error of their ways and think it will be a benefit in the long run. There is no doubt that had the Caminetti bill failed of passage, the whole industry would have had a set-back for another ten years. Moreover, the Legislature would not have passed the favorable laws it did, and these in themselves are of the highest importance. The California Code now recognizes hydraulic mining as a legal industry and defines it.

A History of the Miners' Movement.

In his inaugural address in 1891, Governor H. H. Markham called the attention of the Legislature to the hydraulic mines of California and suggested that the subject be thoroughly agitated, Congress be memorialized, and our Senators and Representatives urged to take all necessary steps to bring the subject properly before Congress at the earliest moment possible. He thought that the subject of the production of gold should be investigated by the Federal Government, just the same as that of irrigation was. A committee of Senators and Assemblymen waited on the Governor and thanked him for his action. During the session of the Legislature a joint resolution was passed asking Congress to appoint a Commission to come to California to examine our rivers and hydraulic mines and take such action as would enable the hydraulic mines to resume operations.

In the meantime the Commission appointed by the Act of Congress in 1888 filed its report with the Secretary of War. This was the report of Lieut. Col. A. Benyuard and Major Hanbury and Major Heuer, from which we have frequently quoted. It recommended the construction of impounding dams for the debris.

In the latter part of 1891, Thomas B. Everett, a miner of Auburn, Placer county, suggested to Mr. Filcher of the Placer Herald the feasibility of calling a convention of the miners of the county to see if they could not take steps to have the hydraulic mines resume work. A call was issued and a number of miners responded. This Placer county convention issued a call for a State Mining Convention, and published an address to the people of California, setting forth the condition of the hydraulic mining industry and asking for assistance and relief. The editor of the MINING AND SCIENTIFIC PRESS happened to be the only San Francisco representative at that convention, and to him was therefore entrusted the preliminary work of interesting San Francisco people in the matter. On his return to the city a meeting was called and 16 gentlemen met and discussed ways and means for organizing. Committees were appointed to arrange for the State Convention, and many people then became interested.

In January, 1892, the State Mining Convention was held, and representatives from all the counties of the State were present. It was the most fully attended convention ever held in this city, and great enthusiasm was manifested. There was a somewhat unexpected reconciliation brought about between the mountain and valley representatives. The miners expressed themselves as willing to abide by the laws and to impound their debris in the future, on understanding which the valley men present were willing to withdraw opposition, it being agreed that Congress was to settle the question between the two factions. A memorial and resolutions were adopted and forwarded to Congress, asking relief on the basis of the report of the U. S. engineers.

A State Miners' Association was then organized, and branch associations formed in the different counties interested. The miners' appeal to Congress was backed up by suitable resolutions of the San Francisco City and County Supervisors, Chamber of Commerce, Board of Trade, and similar organizations, those of Alameda county, and the supervisors of the mining counties. The public press spoke favorably of the resumption of hydraulic mining and sympathy for the miners' cause was everywhere apparent and has since continued.

There was a long and expensive struggle before Congress to get the necessary laws. The Caminetti bill while pending was made the subject of heated discussion, and it was evident that old prejudices had not disappeared and that there were still fanatics on both sides of the controversy. The bill after having suffered many amendments, was, however, finally passed, but in such a shape as to be somewhat unsatisfactory to the two contending factions. Then the State Legislature, which had previously passed a resolution asking Congress to pass the bill, enacted a State law in accord with the Congressional law.

This in brief is a history of the movement which finally resulted in the enactment of the Caminetti and the Ford laws. During this period came a favorable decision from the United States Circuit Court denying an injunction on the North Bloomfield mine. It was in the case of this same mine that the Sawyer decision was given which closed the hydraulic mines of the State. The new decision permitted the mine to continue operations, it having been shown that suitable impounding works had been built and were in operation.

It now remains to be seen whether in the practical working of the new law, the mines could be profitably worked or not. The miners are not entirely agreed on this, but time will soon show. At all events the hydraulic mining business has been placed on a basis which is recognized by National and State laws under the conditions specified in the several acts.

Keeping Pledges.

The anti-debris people having had a good deal to say about the miners having broken faith with the farmers, because a few men hydraulicked contrary to the request of the Miners' Association, it may be as well to say that the miners kept their pledges best. They have only asked to be permitted to mine under the conditions suggested by the U. S. Engineers, and have made no attempt to evade the issue of the impounding dams. But the other side to the controversy, have, in a measure, repudiated their original compromise by denying that any was ever made on their part.

For instance, at the River Improvement Convention in January, 1892, a conference was authorized between the committees of that convention and the Miners' Convention. This conference was to harmonize the interests of the miners and the valley people. It was resolved to aid and assist each other before Congress, in order to have unity of action, and both committees were to use their best efforts to secure favorable legislation for each appropriation for the rivers and creeks and for the plans recommended by the engineers for the resumption of hydraulic mining.

This was all agreed to, and both delegations went on to Washington. When the bill for the improvement of the rivers in California came before the River and Harbor Committee, Judge Searles, who was there in the interest of the miners, made an argument on behalf of the river men. The miners' delegation gave every assistance, and through their efforts the appropriation for California rivers was increased by \$150,000. Just after this action, in May, a mass meeting of farmers and citizens was held in Colusa, protesting against the passage of any hydraulic mining law by Congress tending in any way toward the resumption of the industry. Then, on June 10th, there was a valley county convention held in Sacramento, at which the committee appointed by the Miners' Association was not treated very nicely, and there was so much doubt about admitting them at all, that they left for home before a decision was reached. The valley convention adopted resolutions, among which was the following:

"Inasmuch as it has been stated that the people of the valley favor, or have no objection to, the erection of dams in the navigable rivers of California, or their tributaries, for the purpose of permitting the resumption of hydraulic mining, and in the belief that they will be effectual for that purpose, we solemnly declare that such dams will not restrain the debris that has done so much damage in the past, and we are unalterably opposed to the erection of dams for the further prosecution of hydraulic mining. We deny that the engineers of the United States have reported that the erection of dams will restrain the matter that has injured the rivers, and as proof of this assertion we quote their own language, viz.:

"These dams, however, will not be effective in impounding all of the material delivered into the canyons from the mines. Being in the streams and in the pathway of the freshets, portions of the heavier material will be carried over the crests of the dams, to eventually find lodgement in the river below. The finer sands and clay cannot be effectually impounded by such barriers, but will be carried off in suspension."

This last paragraph from the engineers' report had been many times persistently misquoted by professional anti-debris agitators, and was again misquoted in this instance. The exact language of the paragraph in the official report issued by Congress, is as follows:

"These dams, however, will not be effective in impounding all of the material delivered into the canyons from the mines. Being in the streams and in the pathway of the freshets, portions of the heavier material will be carried over the crests of the dams to eventually find lodgement in the river below. The finer sands and clay cannot be effectually impounded by such barriers, but will be carried off in suspension. With the improved condition which it is desired to give to the navigable rivers it is probable that the greater part of this fine material can be carried off without being productive of harm."

The italics to the concluding sentence are ours. It will be seen that the favorable conclusion of the engineers was suppressed by the farmers of these resolutions, as it had been suppressed in every instance of the kind previously. Now, this is not fair fighting. Explicitly stating that they quote the language of the engineers, and then omitting the conclusion of the paragraph because it is unfavorable to their side, or does not express the opinion they want, is manifestly unjust to the miners, and to their own people as well.

It is worthy of note that those gentlemen present who had attended the Miners' Convention in this city, and had heard both sides of the question, were much more liberal in their ideas than those who had looked at the matter entirely from the anti-debris point of view.

The Sacramento Bee, a strong anti-debris paper, was obliged to confess in this connection "that the action of the Sacramento convention will look to the public more like an attack on hydraulic mining itself than a protest against that portion of it which will inflict damage on the valley and rivers. It savors enough of unfairness in spirit to cause an open rupture with the great majority of the Miners' Association, who have unquestionably acted in good faith in discontinuing mining and in restraining, to the extent of their ability, their less honest colleagues."

The same set of men continued to oppose the Caminetti bill in Congress. When the Debris Commission bill came

up before the Legislature they opposed that. The Ford Hydraulic Mining bill was violently opposed also. The attorney for the Anti-Debris Association said that the quartz and drift miners should be careful in lending their support to the hydraulic miners, because if they continued to do so they might also be enjoined where their tailings entered streams. Mr. Durst of Yuba endeavored to kill the Ford bill by including the quartz, placer and drift mines with the hydraulic claims, in an amendment, which was beaten by a vote of 50 to 16. Both these Ford bills were passed, notwithstanding the protest of the anti-debris men, and they then petitioned the Governor to veto them. He signed both bills, however. The California delegation to the Trans-Mississippi Congress agreed on suitable resolutions favorable to hydraulic mining, but again the anti-debris men objected. They even filed a protest before the Congress in opposition to the recommendation of this delegation. These men went from Yuba, Sutter, Yolo and Colusa counties expressly to defeat the miners, but were themselves defeated. The Congress passed the resolutions.

By and by these men will discover that public opinion has changed on this subject. Congress, the State and public bodies on all sides favor the resumption of hydraulic mining under the proposed conditions, and it will be resumed despite the efforts of the anti-debris clique. But what we have written proves that if pledges or promises have been broken, it has been on the part of the opponents of the miners.

The State Miners' Association.

Until the miners of this State organized as a body, nothing was accomplished in their interest. The hydraulic miners had been making individual contests against the powerful Anti-Debris Association, and had been beaten at every turn. There was no unity of action. The old Miners' Association, which undertook the first fight, was not at all like the new one, since it was subject mainly to the will of an individual who managed it, and those who contributed had little or nothing to say. The present State Miners' Association has in its Executive Committee a vice-president and a representative from each mining county, and, in the conventions, the votes are in proportion to the number of members of the respective County Associations. In this way, every county and every association is duly represented.

Since the State Miners' Association was organized, its influence has been very great. One branch alone has 1500 members and another 1200. Altogether, there are some 6000 members. These are not only hydraulic miners, but those working in drift, quartz and other branches of the industry. It is due to the State Association that so much has been accomplished in various directions. The favorable and helpful action of County Supervisors, Boards of Trade, Chambers of Commerce and other bodies, is due to their efforts. The State Legislature, the Mining Congress and the Trans-Mississippi Congress have all adopted resolutions and memorials favorable to the hydraulic-mining interests of California, a result brought about by the work of the State Miners' Association.

It was the influence of this body which finally obtained the enactment of the Congressional and State laws now in force. Not all that was desired was obtained, but sufficient to rehabilitate the hydraulic mining industry, before absolutely stagnant. Some criticism has been made on the amount of money expended by the delegation sent to Washington by the association; but all with any experience at the National Capital know that delegations with buttoned pockets obtain little or nothing. It is necessary to entertain and not be niggardly in expenditure. This was perfectly understood when the delegation was sent, and the members were as careful in expenditures as the circumstances warranted.

It must be remembered that every step taken and every move made was in the face of vigorous opposition. There was no clear way in front of the association. There was always a measurement of forces against the Anti-Debris Association, organized and ready to oppose nearly everything the miners desired. That association had practically had its own way for some years and naturally resented any interference. The miners being now organized, however, were in a position to have something to say also.

Every move has been carefully considered by the executive committee of the Miners' Association. They had to be prepared to meet opposition at any time, and have always been ready. It has been necessary to keep their proceedings to themselves, but they have been successful before the legislative committees, the legislature, Congress, the Trans-Mississippi Congress, and elsewhere. The miners must continue to keep up their county associations, and thereby their State Association, unless they want to see those opposed to them again get the upper hand. The Miners' Association's work is by no means done. They

have still to work on the U. S. mining laws for the benefit of the quartz, drift and petroleum interests. The association has an active and energetic president and secretary, and an attentive executive committee. It will continue, however, to need the active support of the companies and miners of California to be of benefit to the mining industry of the State.

The Miners Not Lawless.

Though an avowed advocate of the interests of the hydraulic miner in California, the MINING AND SCIENTIFIC PRESS has never had the slightest sympathy with those few men who have defied the laws and continued work against the express injunction of the courts. These men have done the industry immeasurable harm in more ways than one, and greatly hindered and delayed a solution of the problem. Especially during the past two years has their work been detrimental to all except their own personal interests. The Caminetti bill would have been much milder in its provisions had there not been persistent law-breaking on the part of a few miners. The State Miners' Association which had charge of the fight for the resumption of hydraulic mining, issued an earnest appeal to all miners to obey the laws and cease illegal hydraulicking. They had no means of enforcing this request and, while most miners complied, some others did not, and these few made it an uphill fight for the rest. If such men are now detected, fined and imprisoned, they deserve no sympathy whatever. They were really traitors to their own cause.

We understand very well that there was strong provocation in many instances; that men badly needed money and had nothing else to depend on; that they understood richer miners were paying for the privilege of mining and they could not; that they were being prosecuted by strong-handed enemies who showed no mercy; that they thought the decisions stopping them were illegal and unjust; that they had bought their claims in good faith from a Government which took their money and then refused to let them work the ground; that they had worked in this way long before the farms below were cultivated; these and many other reasons were advanced as palliation of their acts. But other men had the same reasons, yet obeyed the mandates of the courts, and while all were fighting in a common cause, it was a great drawback to carry even the small number of men who were breaking one law while asking for another.

Many people with only a superficial knowledge of this subject imagine the hydraulic miners to be a lawless set of men engaged in a business detrimental to the best interests of the State; and this opinion has been brought about by the acts of a few men who have been held up as examples of all. The quiet, law-abiding miners, far in the majority, have not been heard of in the discussion to any extent. Miners away off in Plumas and Sierra counties have been temporarily enjoined which could in no way damage any navigable river; and the temporary injunctions have been practically permanent because it was useless to contest.

The fact is, however, that a great majority of hydraulic miners of California have obeyed the laws. It must be remembered that there has never been a law against hydraulic mining, nothing but the decrees of the courts. There has been no statutory provision. The injunctions of the courts destroyed property worth upward of one hundred million dollars. Spies roamed up and down the mining region for seven or eight years and this only resulted in about sixteen charges of disobeying the laws, some of which were not proven. The miners as a class have, therefore, shown truer and better adherence to the laws than any other class of men under such trying circumstances ever showed. It is admitted that a few of them have violated the injunctions, but they should not be taken as a type of all.

THE Caminetti law, with its penalties, went into effect this week, and as it is a measure of the greatest importance to the gold-mining interests of California, we have devoted most of our space to this and kindred subjects. For this reason we are unable to present any account of the opening of the World's Fair at Chicago. We shall have plenty of opportunity to present to our readers such matters as may interest them connected with the World's Fair.

J. K. LUTTRELL, who was one of the State Miners' Association delegates to Washington to urge hydraulic-mining legislation, has been appointed U. S. Commissioner for Alaska, at a salary of \$4500 per annum.

THE conclusion of the negotiations between the Idaho and Maryland mines, Grass Valley, is an important transaction for that town. The subject is referred to at length in our Mining Summary.

RED gold and copper discoveries are reported in the Eagle Tail mountains, 90 miles west of Phoenix, A. T.

The Trans-Mississippi Congress Favors Hydraulic Mining.

Before the San Francisco delegation left here for Ogden it was agreed by vote to present resolutions asking Congress to appropriate money to build restraining dams for mining debris now in the California rivers. There was, of course, some opposition to the measure, but the vote was overwhelmingly favorable and the proposed resolutions were agreed to. On the train on the way to Ogden the whole California delegation considered these and the other resolutions. The representatives from Colusa, Yolo, Yuba and Sutter counties, voted "no" on the hydraulic mining resolutions, on the ground—according to Mr. George Ohleyer—that hydraulic mining could not be rendered harmless by the construction of dams, and because they declined most emphatically to be committed to the impounding "theory," or to the assertions of the majority of the delegation in relation thereto. The particular representatives from the counties mentioned entered a formal written protest against the adoption of the resolutions referred to. None of this did them any good, however, for among the resolutions adopted by the Congress were the following:

WHEREAS, By the action of the State and United States Courts in the State of California in enjoining hydraulic mining, the gold product of that State has been reduced millions of dollars a year, for the last ten years and,

Whereas, the output of gold is a matter of material importance, not merely to the State of California, but to the finance and treasury of the United States; and,

Whereas, the Congress of the United States at its last session passed a law (commonly known as the Caminetti bill) which provides for the construction, under a board of engineers appointed by the President of the United States, of dams to impound mining debris, by means of which dams, when constructed, the navigable streams of the State of California will be protected from the injuries which would otherwise necessarily result to the navigability of said streams, and which dams would also enable hydraulic mining to be revived without injury to the navigable streams, and vastly add to the gold products of the United States; and,

Whereas, the gold-mining industry of California is now in such a condition that the owners of the mines in large number are not financially able to bear the expense of the construction of such dams, and the State of California has appropriated \$250,000 to aid in the construction of such dams whenever the United States Government shall have made an appropriation for that purpose not less than said sum;

Resolved, By the Trans-Mississippi Congress, in convention assembled, that a great and commanding need of the State of California is liberal treatment of its navigable waters and harbors by the Federal Government, and we earnestly request our representatives in Congress to use all honorable means to secure appropriations adequate to the requirements.

Resolved, That we urge upon Congress the importance of enacting into law the bill recently introduced into Congress by Hon. A. Caminetti, of California, providing for the placing of the Sacramento and San Joaquin rivers under the contract and special commission system.

Resolved, That we urge upon Congress the great importance of making an appropriation of \$450,000 to be used in connection with the \$250,000 appropriated by the State of California, in carrying out the provisions of the Caminetti Hydraulic Mining Law, in the interest of the navigable streams and hydraulic mining recently passed by Congress, in the impounding of debris as provided in such law, is of vital interest and essential to the restoration and preservation of said rivers and harbors, not only as regards debris resulting from future hydraulic mining, under the provisions of said law, but also such debris as now lies in canyons and streams tributary to and destined to be carried into their channels if not restrained.

The U. S. Debris Commissioners Appointed.

On Thursday the President appointed as members of the U. S. Debris Commission Lieut. Colonel George H. Mendell, Colonel Wm. H. H. Benysard and Major William H. Heuer. These are the Commissioners under the Caminetti law, "An Act to create the California Debris Commission and regulate hydraulic mining in the State of California." The Secretary of War, upon request, selected these gentlemen two months ago, but it was not until this week that they were appointed.

After official notice of their appointment, they have 30 days in which to organize. It is to this Commission that hydraulic miners must apply for license to mine. They are all residents of San Francisco, and all well posted on the debris question and the rivers and harbors in California. It is not probable that they will be ready to issue miners' licenses for some time, as they will doubtless wish first to agree on some general plans.

HYDRAULIC MINERS in this State should remember that the San Francisco Board of Trade, composed of business men of this city, contributed more money to their cause than any other organization—three times as much as the largest hydraulic mining company in California. They felt that a resumption of hydraulic mining would be good for the business interests of San Francisco, and the miners can now reciprocate by trading and buying supplies here as much as possible.

THE quicksilver "mine" in this city is still a prospect and there is now talk of a 60-foot shaft to prove the value of the deposit. So far it is only about 18 feet deep.

THE eight-hour bill for miners in Great Britain has passed to a second reading.

Coast Industrial Notes.

THE artesian well being sunk by George W. Durbrow on the desert at Indio commenced to flow last week with evident promise of a large supply of water.

THE government dredger has been taken up to Petaluma creek, where it has about four months' work to do. The McNear dredger is also at work on the McNear canal and basin.

JOHN GRIFFIN of this city, has gone to Astoria to find out what he can do about the sardine run on the Columbia river. He is doing this in the interests of a powerful company, which operates a factory at Astoria and packs large quantities of sardines annually. The plant which the company intends to put in, should the expert's report be favorable, will cost \$360,000.

J. H. SMITH of Portland, Or., who was awarded the contract at \$1,380,000 for constructing the Sunset canal, Fresno county, has sublet two portions of the work. One of these contracts was for machinery and was awarded to the Stillwell, Bierce and Smith-Vaile Company of Dayton, O., at \$100,000. The other contract was for pipe lines and amounts to about \$500,000.

At the last meeting of the Healdsburg city trustees, the California Gaslight and Fuel Company of San Francisco was granted a franchise to supply gas and fuel for light to Healdsburg and its inhabitants. This company will either purchase the old plant of the Healdsburg Gaslight and Fuel Company and reform it so as to use the Avery system, or will put in an entirely new Avery plant.

THE Whitney Transfer Company and G. P. McNear have completed the final arrangements for putting their proposed ferry system in operation on the 15th inst. Davie's wharf, between Webster and Harrison streets, has been leased, and the company's steamer, the Whitney Transfer, is now ready for duty, having undergone a thorough overhauling. The Harbor Commissioners will set aside a landing for the line on the San Francisco side.

THE Del Norte Record says that the "bull donkey" for use in one of Hobbs, Wall & Co's logging camps is now ready for work. The machine was built in San Francisco, but is a Humboldt production. One has been in use quite a time and works satisfactorily. It does away with oxen and horses in hauling logs to landings. Most of the Humboldt logging camps have employed oxen, and in stormy weather it was difficult to do work to advantage. The Pacific Lumber Company employed horses, which was faster than ox teams, but this machine will revolutionize all that.

IT IS ESTIMATED that there are now in the Columbia river, from all the salmon canneries, 1271 boats. From the opening of the season to to-day 52,310 salmon have been caught, which is equal to 17,500 cases. Contrasting the April pack with that of last year for the same month, these figures show that the canneries are 200 cases ahead of last season. In fact the pack up to the present time has been in every way an improvement on previous years. Owing to the prolonged cold and stormy weather the fish is harder and far more solid than is usual, and altogether the grade of salmon is very high. On account of the 5 cents per pound rule, the cannerymen are quoting higher rates to brokers and agents, and prices seem to be ruling strong and high.

FRANK F. CORRELL, of Modesto, has filed notice of location of 500,000 inches of water measured under a four-inch pressure on the San Joaquin river, the water to be utilized for the irrigation of desert lands in Stanislaus, Contra Costa and Alameda counties for domestic purposes and for power purposes for manufacturing in the said counties. The locator says that he intends to divert the water at a point at or near the line of sections 26 and 27, township 4 south, range 7 east, "near Grayson," and carry it in a main trunk canal for the purpose of distribution, said canal to be fifty feet in width at the bottom. Also to distribute the water by means of lateral canals, flumes, pipes, etc. The canal is to take a westerly course, following the contour of the land to the mouth of the San Joaquin river near Antioch.

OAKLAND is promised an abundant supply of pure water from the Alvarado artesian wells before the close of the year. W. J. Dingee, who is at the head of the enterprise, has employed Engineer Boardman, and the first work will be the construction of a circular reservoir 60 feet in diameter and 15 feet in depth, near the old steamer landing. Within a radius of 300 yards of the point there are now four flowing wells, which, tapped ten feet below the surface, will supply more than enough water, according to the engineer's estimates, than the city needs. The main from Alvarado to Oakland will be 30 inches in diameter, with a capacity of supplying 7,000,000 gallons every twenty-four hours, a quantity double the present water consumption of the city. The length of the main will be eighteen or twenty miles and the pumping will be done by a 500-horse-power engine.

THE steamer St. Paul, chartered by the North American Navigation Co., took away a large amount of freight which is to go to New York by way of the Isthmus. On deck 11,000 feet of selected redwood lumber was piled to a level with the deckhouse. The lumber is for cabinet-workers in New York to use. The shipments of high explosives include 400 cases of dynamite and 400 cases of giant powder for San Jose de Guatemala, 20 cases of dynamite for La Libertad, San Salvador, and 400 cases of dynamite for Amapala, Honduras. The remaining cargo is of a miscellaneous nature. There are 500 barrels of cement and 500 cases of coal oil for San Jose de Guatemala; hardware, oil, paints, canned goods, rice and corn for Champerico; corn and stationery for Acajutla; pampas plumes for Germany; 15,648 pearl shells for Eoglaod; wine for France; 600 flasks of quicksilver, valued at \$25,000, for New York; besides 465,510 pounds of borax, 8350 gallons California wine and 950 gallons of brandy. The cargo is a very valuable one for the size.

The Caminetti Law.

An Act to Create the California Debris Commission and Regulate Hydraulic Mining in the State of California.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That a commission is hereby created, to be known as the California Debris Commission, consisting of three members. The President of the United States shall, by and with the advice and consent of the Senate, appoint the commission from officers of the Corps of Engineers, United States Army. Vacancies occurring therein shall be filled in like manner. It shall have the authority, and exercise the powers hereinafter set forth, under the supervision of the Chief of Engineers and direction of the Secretary of War.

SEC. 2. That said commission shall organize within thirty days after its appointment by the selection of such officers as may be required in the performance of its duties, the same to be selected from the members thereof. The members of said commission shall receive no greater compensation than is now allowed by law to each, respectively, as an officer of said Corps of Engineers. It shall also adopt rules and regulations, not inconsistent with law, to govern its deliberations and prescribe the method of procedure under the provisions of this Act.

SEC. 3. That the jurisdiction of said commission, in so far as the same affects mining carried on by the hydraulic process, shall extend to all such mining in the territory drained by the Sacramento and San Joaquin river systems in the State of California. Hydraulic mining, as defined in Section eight hereof, directly or indirectly injuring the navigability of said river systems, carried on in said territory other than as permitted under the provisions of this Act, is hereby prohibited and declared unlawful.

SEC. 4. That it shall be the duty of said commission to mature and adopt such plan or plans, from examinations and surveys already made and from such additional examinations and surveys as it may deem necessary, as will improve the navigability of all the rivers comprising said systems, deepen their channels and protect their banks. Such plan or plans shall be matured with a view of making the same effective against the encroachment of and damage from debris resulting from mining operations, natural erosion, or other causes, with a view of restoring, as near as practicable and the necessities of commerce and navigation demand, the navigability of said rivers to the condition existing in eighteen hundred and sixty, and permitting mining by the hydraulic process, as the term is understood in said State, to be carried on, provided the same can be accomplished without injury to the navigability of said rivers or the lands adjacent thereto.

SEC. 5. That it shall further examine, survey and determine the utility and practicability, for the purposes hereinafter indicated, of storage sites in the tributaries of said rivers and in the respective branches of said tributaries, or in the plains, basins, sloughs and tule and swamp lands adjacent to or along the course of said rivers, for the storage of debris or water or as settling reservoirs, with the object of using the same by either or all of these methods to aid in the improvement and protection of said navigable rivers by preventing deposits therein of debris resulting from mining operations, natural erosion or other causes, or for affording relief thereto in flood-time and providing sufficient water to maintain scouring force therein in the summer season; and in connection therewith to investigate such hydraulic and other mines as are now or may have been worked by methods intended to restrain the debris and material moved in operating such mines by impounding dams, settling reservoirs, or otherwise, and in general to make such study of and researches in the hydraulic mining industry as science, experience and engineering skill may suggest as practicable and useful in devising a method or methods whereby such mining may be carried on as aforesaid.

SEC. 6. That the said commission shall from time to time note the conditions of the navigable channels of said river systems, by cross-section surveys or otherwise, in order to ascertain the effect therein of such hydraulic mining operations as may be permitted by its orders and such as is caused by erosion, natural or otherwise.

SEC. 7. That said commission shall submit to the Chief of Engineers, for the information of the Secretary of War, on or before the fifteenth day of November of each year, a report of its labors and transactions, with plans for the construction, completion and preservation of the public works outlined in this Act, together with estimates of the cost thereof, stating what amounts can be profitably expended thereon each year. The Secretary of War shall thereupon submit same to Congress on or before the meeting thereof.

SEC. 8. That for the purposes of this Act "hydraulic mining" and "mining by the hydraulic process," are hereby declared to have the meaning and application given to said terms in said State.

SEC. 9. That the individual proprietor or proprietors, or in case of a corporation its manager or agent appointed for that purpose, owning mining ground in the territory in the State of California mentioned in section three hereof, which it is desired to work by the hydraulic process, must file with said commission a verified petition, setting forth such facts as will comply with law and rules prescribed by said commission.

SEC. 10. That said petition shall be accompanied by an instrument duly executed and acknowledged, as required by the law of the said State, whereby the owner or owners of such mine or mines surrender to the United States the right and privilege to regulate by law, as provided in this act, or any law that may hereafter be enacted, or by such rules and regulations as may be prescribed by virtue thereof, the manner and method in which the debris resulting from the working of said mine or mines shall be restrained, and what amount shall be produced therefrom; it being understood that the surrender aforesaid shall not be construed as in any way affecting the right of such owner or owners to operate said mine or mines by any other process or method now in use in said State: *Provided*, That they shall not interfere with the navigability of the aforesaid rivers.

SEC. 11. That the owners of several mining claims situated so as to require a common dumping ground or dam or other restraining works for the debris issuing therefrom in one or more sites may file a joint petition setting forth such facts in addition to the requirements of section nine hereof; and where the owner of a hydraulic mine or owners of several such mines have and use common dumping sites for impounding debris or as settling reservoirs, which sites are located below the mine of an applicant not entitled to use same, such fact shall also be stated in said petition. Thereupon the same proceedings shall be had as provided for herein.

SEC. 12. A notice specifying briefly the contents of said petition and fixing a time previous to which all proofs are to be submitted shall be published by said commission in some newspaper or newspapers of general circulation in the communities interested in the matter set forth therein. If published in a daily paper, such publication shall continue for at least ten days; if in a weekly paper, in at least three issues of the same. Pending publication thereof said commission, or a committee thereof, shall examine the mine and premises described in such petition. On or before the time so fixed all parties interested, either as petitioners or contestants, whether miners or agriculturists, may file affidavits, plans and maps in support of their respective claims. Further hearings, upon notice to all parties of record, may be granted by the commission when necessary.

SEC. 13. That in case a majority of the members of said commission, within thirty days after the time so fixed, concur in a decision in favor of the petitioner or petitioners, the said commission shall thereupon make an order directing the methods and specifying in detail the manner in which operations shall proceed in such mine or mines; what restraining or impounding works, if facilities therefor can be found, shall be built, and maintained; how and of what material; where to be located; and in general set forth such further requirements and safeguards as will protect the public interests and prevent injury to the said navigable rivers, and the lands adjacent thereto; with such further conditions and limitations as will observe all the provisions of this act in relation to the working thereof and the pay-

ment of taxes on the gross proceeds of the same: *Provided*, That all expense incurred in complying with said order shall be borne by the owner or owners of such mine or mines.

SEC. 14. That such petitioner or petitioners must within a reasonable time present plans and specifications of all works required to be built in pursuance of said order for examination, correction and approval by said commission; and thereupon work may immediately commence thereon under the supervision of said commission or representative thereof attached thereto from said Corps of Engineers, who shall inspect same from time to time. Upon completion thereof, if found in every respect to meet the requirements of the said order and said approved plans and specifications, permission shall thereupon be granted to the owner or owners of such mine or mines to commence mining operations, subject to the conditions of said order and the provisions of this Act.

SEC. 15. That no permission granted to a mine owner or owners under this act shall take effect, so far as regards the working of a mine, until all impounding dams or other restraining works, if any are prescribed by the order granting such permission, have been completed and until the impounding dams or other restraining works or settling reservoirs provided by said commission have reached such a stage as, in the opinion of said commission, it is safe to use the same: *Provided, however*, That if said commission shall be of the opinion that the restraining and other works already constructed at the mine or mines shall be sufficient to protect the navigable rivers of said systems and the work of said commission, then the owner or owners of such mine or mines may be permitted to commence operations.

SEC. 16. That in case the joint petition referred to in section eleven hereof is granted, the commission shall fix the respective amounts to be paid by each owner of such mines toward providing and building necessary impounding dams or other restraining works. In the event of a petition being filed after the entry of such order, or in case the impounding dam or dams or other restraining works have already been constructed and accepted by said commission, the commission shall fix such amount as may be reasonable for the privilege of dumping therein, which amount shall be divided between the original owners of such impounding dams or other restraining works in proportion to the amount respectively paid by each party owning the same. The expense of maintaining and protecting such joint dam or works shall be divided among mine-owners using the same in such proportion as the commission shall determine. In all cases where it is practicable, restraining and impounding works are to be provided, constructed, and maintained by mine-owners near or below the mine or mines before reaching the main tributaries of said navigable waters.

SEC. 17. That at no time shall any more debris be permitted to be washed away from any hydraulic mine or mines situated on the tributaries of said rivers and the respective branches of each, worked under the provisions of this act, than can be impounded within the restraining works erected.

SEC. 18. That the said commission may at any time, when the condition of the navigable rivers or when the capacities of all impounding and settling facilities erected by mine-owners or such as may be provided by Government authority require same, modify the order granting the privilege to mine by the hydraulic mining process so as to reduce amount thereof to meet the capacities of the facilities then in use, or if actually required in order to protect the navigable rivers from damage, may revoke same until the further notice of the commission.

SEC. 19. That an intentional violation on the part of a mine owner or owners, company, or corporation, or the agents or employees of either, of the conditions of the order granted pursuant to section thirteen, or such modifications thereof as may have been made by said commission, shall work a forfeiture of the privileges thereby conferred, and upon notice being served by the order of said commission upon said owner or owners, company, or corporation, or agent in charge, work shall immediately cease. Said commission shall take necessary steps to enforce its orders in case of the failure, neglect or refusal of such owner or owners, company, or corporation, or agents thereof, to comply therewith, or in the event of any person or persons, company, or corporation working by said process in said territory contrary to law.

SEC. 20. That said commission, or a committee therefrom, or officer of said corps assigned to duty under its orders, shall, whenever deemed necessary, visit said territory and all mines operating under the provisions of this act. A report of such examination shall be placed on file.

SEC. 21. That the said commission is hereby granted the right to use any of the public lands of the United States, or any rock, stone, timber, trees, brush, or material thereon or therein, for any of the purposes of this act; that the Secretary of the Interior is hereby authorized and requested, after notice has been filed with the Commissioner of the General Land Office by said commission, setting forth what public lands are required by it under the authority of this section, that such land or lands shall be withdrawn from sale and entry under the laws of the United States.

SEC. 22. That any person or persons who willfully or maliciously injure, damage, or destroy, or attempt to injure, damage, or destroy, any dam or other work erected under the provisions of this act for restraining, impounding, or settling purposes, or for use in connection therewith, shall be guilty of a misdemeanor, and upon conviction thereof shall be fined not to exceed the sum of five thousand dollars or be imprisoned not to exceed five years, or by both such fine and imprisonment, in the discretion of the court. And any person or persons, company or corporation, their agents or employees, who shall mine by the hydraulic process directly or indirectly injuring the navigable waters of the United States, in violation of the provisions of this act shall be guilty of a misdemeanor, and upon conviction thereof shall be punished by a fine not exceeding five thousand dollars, or by imprisonment not exceeding one year, or by both such fine and imprisonment, in the discretion of the court: *Provided*, That this section shall take effect on the first day of May, eighteen hundred and ninety-three.

SEC. 23. That upon the construction by the said commission of dams or other works for the detention of debris from hydraulic mines and the issuing of the order provided for by this Act to any individual, company or corporation to work any mine or mines by hydraulic process, the individual, company or corporation operating thereunder working any mine or mines by hydraulic process, the debris from which flows into or is in whole or in part restrained by such dams or other works erected by said commission, shall pay a tax of three per centum on the gross proceeds of his, their or its mine so worked, which tax of three per centum shall be ascertained and paid in accordance with regulations to be adopted by the Secretary of the Treasury, and the Treasurer of the United States is hereby authorized to receive the same. All sums of money paid into the Treasury under this section shall be set apart and credited to a fund to be known as the "Debris Fund," and shall be expended by said commission under the supervision of the Chief of Engineers and direction of the Secretary of War, in addition to the appropriations made by law in the construction and maintenance of such restraining works and settling reservoirs as may be proper and necessary: *Provided*, That said commission is hereby authorized to receive and pay into the Treasury from the owner or owners of mines worked by the hydraulic process, to whom permission may have been granted so to work under the provisions hereof, such money advances as may be offered to aid in the construction of such impounding dams or other restraining works, or settling reservoirs, or sites therefor, as may be deemed necessary by said commission to protect the navigable channels of said river systems, on condition that all moneys so advanced shall be refunded as the said tax is paid into the said debris fund; *And provided further*, That in no event shall the Government of the United States be held liable to refund same except as directed by this section.

SEC. 24. That for the purpose of securing harmony of action and economy in expenditures in the work to be done by the United States and the State of California, respectively, the former in its plans for

the improvement and protection of the navigable streams and to prevent the depositing of mining debris or other materials within the same, and the latter in its plans authorized by law for the reclamation, drainage and protection of its lands, or relating to the working of hydraulic mines, the said commission is empowered to consult thereon with a commission of engineers of said State. If authorized by said State for said purpose, the result of such conference to be reported to the Chief of Engineers of the United States Army, and, if by him approved, shall be followed by said commission.

SEC. 25. That said commission, in order that such material as is now or may hereafter be lodged in the tributaries of the Sacramento and San Joaquin River systems resulting from mining operations, natural erosion or other causes, shall be prevented from injuring the said navigable rivers or such of the tributaries of either as may be navigable, and the land adjacent thereto, is hereby directed and empowered, when appropriations are made therefor by law, or sufficient money is deposited for that purpose in said debris fund, to build at such points above the head of navigation in said rivers and on the main tributaries thereof, or branches of such tributaries, or at any place adjacent to the same, which, in the judgment of said commission, will effect said object (the time to be of such material as will insure safety and permanency), such restraining or impounding dams and settling reservoirs, with such canals, locks or other works adapted and required to complete same. The recommendations contained in Executive Document Numbered Two hundred and sixty seven, Fifty-first Congress, second session, and Executive Document Numbered Ninety-eight, Forty-seventh Congress, first session, as far as they refer to impounding dams or other restraining works, are hereby adopted, and the same are directed to be made the basis of operations. The sum of fifteen thousand dollars is hereby appropriated, from moneys in the Treasury not otherwise appropriated, to be immediately available to defray the expenses of said commission.

Approved March 1, 1893.

Full Text of the North Bloomfield Decision.

The following is the complete decision of Judge Gilbert of the U. S. Circuit Court in the case of the United States vs. the North Bloomfield Gravel Mining Co., in favor of the North Bloomfield Gravel Mining Co., that its mining operations do not injure the navigable streams, and also modifying the injunction in the Woodruff case so as to allow it to mine by use of its impounding works. This decision has not before been published complete and is here given that hydraulic miners may understand its full scope:

In the Circuit Court of the United States in and for the Ninth Circuit, Northern District of California.

HON. WM. B. GILBERT, JUDGE.

UNITED STATES, Complainant,
vs.
THE NORTH BLOOMFIELD GRAVEL MINING CO., Defendant.
No. 7865.

WEDNESDAY, October 5, 1892.

Appearances.

A. L. RHODES, Solicitor for United States.
C. W. CROSS, Solicitor for North Bloomfield Gravel Mining Co.

Gilbert, J.—This is a suit for an injunction brought by the United States as complainant against the defendant corporation. The essential averments of the bill are that the Mining Company is engaged in hydraulic mining in Nevada county, and dumping its debris and tailings in such a way that the same flow into the South Yuba River, a tributary of the main Yuba River; thence into the main Yuba River; thence into the Feather River, and thence into the Sacramento. That the Yuba River is navigable from Marysville to its mouth, and Feather River is navigable from the mouth of the Yuba to the Sacramento, and that the Sacramento is navigable from its mouth to the mouth of the Feather. That heretofore, extensive hydraulic mining had been carried on upon the western water-shed of the Sierra Nevada mountains, which had done great injury to the navigable streams referred to, and that the hydraulic mining, as conducted by the defendant, had done great injury to said navigable streams, and the continuation of it will further materially contribute to the injury complained of.

The answer of the defendant denies that it was dumping debris or tailings from its mining operations so that the same flowed into the said rivers; but it alleges that it has erected extensive impounding works by means of which it impounded upon its own lands, and within its own mines, all material likely to injure the navigation of said streams, and that it would continue to impound such mining material so long as it should continue its mining operations, and that the same would remain permanently impounded and restrained in such a manner as not to injure the navigation of such streams. A large amount of testimony was taken on behalf of the respective parties, and the case is now to be decided upon final hearing.

At the outset we are met with the objection that the Court has no jurisdiction of the case, and that there is no right of action in the United States to prosecute the same. This objection was not raised by plea or demurrer, or in the answer, but was first presented upon the final argument. It is claimed that this Court has no jurisdiction of the cause for the reason that at the time of the commencement of the suit, in June, 1888, no Act had been passed by the Congress of the United States by which the United States Government had asserted its constitutional right to assume jurisdiction of the navigable streams referred to in the bill.

There can be no question of the right of the defendant to raise this objection to the jurisdiction upon final hearing. It is not a question of personal privilege, which can be waived by answer or by going to trial upon the merits; it is a fundamental question that goes to the right of the Court to hear and determine the matters involved in the suit.

If the Court have not the inherent power to bear and determine the cause, the parties to the suit cannot, either by their failure or neglect to attack the jurisdiction, or by their expressed consent and desire to confer jurisdiction, authorize the Court to proceed. The judgment of the Court in such a case would be a nullity. Hence, it is not left to the parties alone to raise the question of the jurisdiction, but by statute it is made the duty of the Court itself to dismiss the cause upon its own motion whenever the want of jurisdiction shall appear.

Grace vs. Insurance Co., 109 U. S. 278.

Bors vs. Preston, 111 U. S. 252.

Mansfield vs. Swan, 111 U. S. 379.

In this case, however, if there exists a cause of suit in favor of the United States, this Court has, undoubtedly, jurisdiction of the subject matter of the same, so that the real question is not so much whether the Court has jurisdiction as it is whether the plaintiff has a cause of suit.

The subject of the constitutional right of Congress to regulate commerce between the States, and the legislation necessary to carry that right into effect, together with the respective jurisdiction of the State Legislatures and Courts over navigable streams within their borders, have been considered in several decisions of the Supreme Court, and therein the limits of the jurisdiction of the Federal Courts have been clearly defined.

It is necessary to refer to a few only of these cases.

In the case of *Gilman vs. Philadelphia*, 3 Wall. 713, the Supreme Court affirmed the decree of the Court below, dismissing a bill brought to prevent the erection of a permanent bridge over the Schuylkill River at Philadelphia, the Supreme Court holding that as the river was wholly within her limits, the State had not exceeded the

bounds of her authority, and that until the dormant power of the Constitution was awakened and made effective, by appropriate legislation, the reserve power of the State was plenary, and its exercise in good faith not the subject of review by the Court.

In the case of *Escanaba Co. vs. Chicago*, 127 U. S. 678, the Supreme Court held, in respect of the Chicago River and its tributaries, which are navigable and lie within the limits of the State of Illinois, that Congress, in the exercise of its power under the Commerce Clause of the Constitution, may exercise control over the same to the extent necessary to protect, preserve and improve free navigation; yet, until that body acts, the State has plenary power over bridges across them.

In the case of *Cardwell vs. American Bridge Co.*, the question arose whether the act admitting California into the Union and declaring "that all the navigable waters within the said State shall be 'common highways and forever free, as well to the inhabitants of 'said State as to the citizens of the United States, without any tax, 'impost or duty thereon,' Congress had adopted such legislation over the navigable streams as would confer jurisdiction upon the United States Courts in a suit between private parties. After mature and careful consideration the Court held:

"That the portion of the Statute declaring that the navigable 'waters should be 'common highways was to be construed together with 'the remainder of the statute, which declares that the same shall be 'without tax, impost or duty, and that the whole intent and purpose 'of the statute was to provide against the use of navigable streams 'by private parties to the exclusion of the public and the exaction 'of toll for the navigation, and that it did not restrict the power of the 'State to authorize the construction of bridges, whenever such construction would promote the convenience of the public.

To the same effect is the decision in *Hamilton vs. Vicksburg Railroad Co.*, 119 U. S. 280.

In *Willamette Iron Bridge Co. vs. Hatch*, 125 U. S. 1, the Supreme Court, in a decision rendered by Mr. Justice Bradley, affirmed the doctrine of the previous cases and proceeded further in the line of those decisions and held that:

"There must be a direct statute of the United States in order to 'bring within the scope of its laws, as administered by the Courts 'of law and equity, obstructions and nuisances in navigable streams 'within the States. Such obstructions and nuisances are offenses 'against the laws of the States within which the navigable waters 'lie, and may be indicted or prohibited as such; but they are not 'offenses against United States laws which do not exist; and none 'such exist except what are to be found on the statute book."

The general purport of these decisions is that no recourse can be had to the Federal Courts on the ground that a Federal question is involved, unless Congress has, in pursuance of the right to regulate commerce, proceeded to carry out its constitutional power by legislative enactment in such a way as to prescribe the limit and extent of the regulation attempted to be asserted. In the case before the Court, however, I hold that it is not necessary that there be an infringement of a law of Congress in order that this Court may proceed to bear and determine the cause. All that is necessary is that a right of suit shall exist in favor of the complainant. Have the United States the right to preserve and protect the navigability of these streams by this suit for an injunction? It may be true, as contended, that the injury complained of is not an offense against any statute of the United States. It is equally clear that it is not an offense against any unwritten law of the Government, for there is no common law of the United States. The acts complained of, however, are injurious to the navigability of the streams. Congress has the undisputed power to regulate commerce between the States, and consequently it has power to prevent obstructions to navigation in navigable streams. The State of California has not assumed by the enactment of any statute or by the grant of franchise, to permit these obstructions, or to regulate the same. At the time this suit was commenced the General Government could lawfully assume jurisdiction over the rivers referred to.

Prior to the commencement of this suit Congress appropriated certain moneys for the improvement of these and other rivers in California, and accompanying the appropriation enacted a statute providing as follows:

"The balance of said unexpended money not to be used until the 'Secretary of War be satisfied that hydraulic mining, hurtful to navigation, has ceased on said waters and their tributaries. If he be 'not so satisfied he is hereby instructed to institute such legal proceedings as may be necessary to prevent the washing, sluicing, 'dumping or discharging detritus, debris or slickens caused by or 'arising from hydraulic mining, into either of said rivers or any of 'its tributaries, etc., etc., and he is hereby instructed to use out of 'said sum as much as may be necessary for said purpose."

24 U. S. Stats. at Large, 326.

This statute, while it does not amount to legislation sufficient to confer jurisdiction upon this Court over a suit between private parties, is sufficient to authorize the commencement of this suit by the United States. If this suit were in the nature of a criminal prosecution, or were an action for damages for past injury to navigable streams, there would be good reason to say that no cause of action existed in favor of the United States, for the reason that the wrongful acts in respect of which the action was commenced were not, at the time they were committed, interdicted by any statute of the United States. But this suit is instituted solely to protect navigation by restraining and enjoining future injury. The past injuries are referred to in the bill only for the purpose of informing the Court of the nature of the evils complained of and the extent of the injury to be apprehended in the future.

The statute quoted amounts to a declaration that these obstructions to the navigability of streams, which at common law would amount to nuisance, must hereafter cease, and that to prevent their recurrence the Secretary of War is authorized to institute any legal proceeding that may be necessary for that purpose. Under the discretion vested in the Secretary of War, no remedy could be so simple, direct and adequate as this suit for an injunction.

But even if there were no express statutory authority for the commencement of this proceeding for an injunction, there is sufficient reason for holding that the United States would have the right, independent of the statute, on the ground that an injunction is a necessary preliminary step to protect the improvements to navigation, authorized and about to be made under the Act of Congress just referred to.

It was said, in *Willamette Iron Bridge Co. vs. Hatch*, supra, that the appropriation by Congress of money to be expended in improving the navigation of a navigable river was no assumption of police power over the river, but in the same decision it is declared that any interference with the operations, constructions or improvements made by the general Government would be an offense against the laws and authority of the United States.

In the case of the *United States vs. Mississippi and Rum River Boom Co.*, 3 Fed. 548, it was held that where Congress had assumed jurisdiction of a river in interest of commerce, by causing the erection of works to improve its navigability, an injunction would be granted by the Circuit Court, at the suit of the United States, to prevent threatened injury to the improvement.

In *United States vs. Duluth*, 1 Dillon, 459, decided by Mr. Justice Miller, it was held that the United States may bring an injunction bill in the proper Circuit Court to protect improvements then being made in navigable waters under the authority of Congress.

If the right thus to protect improvements to navigation already made, and improvements in the course of being made under appropriations by Congress for that purpose, is accorded to the United States, it is difficult to perceive why a similar right does not exist preparatory to and in contemplation of such improvements, to restrain acts the continuance of which would render the objects to be accomplished by the appropriation less effective or of no avail.

It remains to be considered whether, under the allegations of the bill and the evidence introduced on behalf of the respective parties, an injunction should issue as prayed for.

The operation of the mine of this defendant corporation was enjoined by a decree of this Court in 1884, in the suit of *Woodruff vs. North Bloomfield Mining Co.*, and that injunction still remains in

force. In the decree an intimation was made that if in the future the defendant corporation should show to the Court that it had constructed impounding reservoirs which would successfully impound its mining debris, the decree might be modified so as to permit the operation of the mine. The defendant, since that decree and before the commencement of this suit, had established and was using the system of impounding works referred to in its answer to the bill. The question of fact now to be determined is whether or not, with the use and operation of the impounding works, mining debris escapes from the defendant's mine into the navigable waters of the Yuba, the Feather or the Sacramento, so as to tend to impair or injure the navigability of those streams. It becomes necessary, therefore, to carefully consider the construction and operation of the impounding device. At the time of the injunction in 1884 the North Bloomfield Mining Company, by the use of its monitors and its system of placer mining, had made an excavation on its grounds, which was in length nearly a mile, in width from five hundred to one thousand feet, in depth varying from one hundred and fifty to four hundred feet. There was no considerable stream of water running through this excavation and there was no natural outlet in the same. The tailings and debris from the mine had been discharged through a shaft which was sunk through solid rock near the center of the excavation. This shaft was eighty feet in the perpendicular and connected with a tunnel cut also through the solid rock, a distance of nearly half a mile, and opening into Humboldt canyon, which lies considerably below the level of the excavation. The total cost of the tunnel and shaft were in the neighborhood of half a million dollars. The impounding works were constructed by utilizing the excavation, the shaft and the tunnel. The impounding area is divided by a dam into two impounding basins, each of about twenty acres in extent, which may be called the old and the new basins. The surface of the old basin lies at an altitude of about one hundred feet above that of the new. The mining operations are all carried on at the upper end of the excavation. The mining is done upon two levels or benches, one at an elevation of about one hundred feet above the other. The debris from the upper mining level is carried on that level to the old impounding basin. The debris from the lower mining level is intended to be impounded in the new basin. Near the lower end of the old basin an inclined shaft has been sunk to connect with the tunnel, and its use is to allow the escape of water after all material likely to injure navigation shall have been deposited in the basin. A similar outlet is made in the new impounding basin, and both these outlets are cribbed up from the bottom so that a thin sheet of water from the surface only can escape. The operation of the old reservoir has been tested and a considerable amount of debris has been deposited within it. The dam which separates the basins is constructed across the excavation and prevents the debris from running back from the old basin into the new basin and the lower levels of the mine. The operation of impounding has been conducted in the following manner: The debris from the mining on the upper bench, consisting of gravel, sand and comminuted clay, together with sufficient water to carry the same, has been conducted by a sluice, with a tolerably swift current, down to the upper edge of the old impounding reservoir, and there discharged into the pond or lake. It has been found that the heavy material is deposited first, the lighter sand and gravel are carried somewhat farther, and when the current strikes the body of water in the pond nearly all the remaining material carried by the water is deposited, forming a bench across the upper end of the depositing pool, which presents an almost perpendicular wall from the surface to the bottom. The water, on striking the pool, is diffused through it and its current apparently ceases. It has the effect to raise the water in the pool and to cause a constant outpour from its surface over the edges of the lower crib.

There are three objections urged against the operation of this impounding reservoir. First, that it does not successfully remove from the water the material which is carried in suspension, and that the water which escapes by the cribs takes with it material which becomes deposited in the lower streams and injuriously affects the navigability of the same. Second, that the dam across the excavation is not of durable material and is liable to break. Third, that the cribs are liable to break or decay, and the impounding material may thus escape into the streams below.

Upon the first of these objections the evidence, although voluminous, is not to any considerable extent conflicting. The water that escapes through the cribs is discolored with very fine particles of comminuted clay which are held in suspension. It is impossible that water that has once fairly come to rest in the pool, and has then been drawn off from the surface through the cribs, should carry with it any sand or anything other than the lightest material. The evidence goes to prove that the fine clay held in suspension in the water, and which causes its discoloration, is of specific gravity very little greater than water, and that it will remain in suspension so long as the water moves with the velocity of a mile in two hours.

The evidence further shows that this material is carried in a state of suspension through the Yuba, the Feather and the Sacramento rivers, and into the ocean. It does not appear that at any point on those streams the water comes to rest, or the clay which it carries is deposited in an appreciable quantity.

After taking into consideration all of the evidence, I am convinced that after the water which conducts the mining debris shall have once come to rest so as to deposit all the sand and heavier material that is carried in suspension, leaving only the light, filamentary particles of clay, which give it its color, no material will be subsequently deposited from it unless it is brought to rest, and so remains for a period longer than it has remained at rest in the impounding pool.

Second—Is there danger to be apprehended from insufficiency of the dam which separates the old from the new impounding basin? The dam is constructed of brush and small trees, carefully laid so that the butts form the outer wall. It is made by layers, as the root fills up and as the deposited debris requires it. The interstices between the layers of brush are filled in with the gravel, sand and clay deposited from the flume. The dam as it now stands presents a wall nearly one hundred feet high, which seems to be a compact solid mass of gravel, sand and clay, with the brush interwoven so as to hold in place. If there were great pressure upon this dam, if it were a dam across a torrential stream, if its breaking or carrying away would discharge into the streams below, the debris that has accumulated, it would appear to be clearly insufficient for the purpose intended, but the evidence together with a personal inspection of the dam convinces me that there is no great pressure upon the dam. The heavy material deposited has not only accumulated about the dam, but for a considerable distance below, and the mass appears to be now in the process of recementation and solidifying, which already, to a considerable extent, has restored it to the condition of the material in the surrounding hills. If this dam should break, it is difficult to see where injury could result, for the impounded material, if it moved at all, could only escape into the new impounding reservoir. It is plain that there is no danger from winter torrents. The mine is not in the bed of a mountain stream. The amount of water which naturally falls into this excavation is small, and even in a winter torrent it must either all escape by the cribs or simply accumulate, and form a lake within the walls of the excavation.

It remains to be considered whether there is danger to the navigability of the streams from the breaking, decaying or destruction of cribs. The cribs are built of logs, about a foot in diameter, notched at the corners and laid in log-cabin style, lined within with heavy planks, tightly nailed, and covered on the outside with planks in a similar manner, so that the opening within the clear is about three or four feet square. It is claimed by the defendant that this material will not decay so long as it is kept moist by the surrounding mass. I do not think that that contention is well established by the evidence. The cribs, in time, will decay, but they will last for many years, and they will doubtless considerably outlast the use of these pools for impounding reservoirs. After the pools shall have been filled up with mining debris, and these cribs shall no longer be the outlet of the water of the mine, I do not perceive any harm that can come from their decaying. By that time the impounded material must have become, to a large degree, compact and solidified, so that the caving in

of any considerable portion of it need not be expected; and if it should cave in, it is plain to my mind that the result would be simply to choke up the shaft and permanently close the same. This view is supported by the history of the use of the shaft heretofore. It is proven that the sudden discharge into the shaft and tunnel of a greater amount of debris than the water could carry away has resulted in a choking up of the outlet, and that the mass of material and water above has simply served, by their pressure, to increase the difficulty of removing the material and reopening the shaft. In short, the danger to be apprehended from the operation of the North Bloomfield mine, with its impounding reservoirs as constructed and used and intended to be used, is so remote and improbable that the Court is not justified in enjoining the use of the property and thereby interdicting a valuable industry.

In arriving at this conclusion, I am not unmindful of the great damage to navigation that has heretofore resulted from the deposit of mining debris, nor of the important interests that are involved, but I am convinced that in the case of this particular mine the contingency has arisen which was contemplated in the decision of this Court in the mining debris cases, in providing that the decree might thereafter be modified upon a showing to the Court that a plan to obviate the injuries had been successfully executed.

The injunction will be denied.

The California State Debris Commission.

An Act to Provide for the Appointment, Duties and Compensation of a Debris Commissioner, and to Make an Appropriation to Be Expended Under His Directions in the Discharge of His Duties as Such Commissioner.

The People of the State of California, represented in Senate and Assembly, do enact as follows:

SECTION 1. The Governor of the State of California shall, on or before the first day of January, eighteen hundred and ninety-four, appoint a competent civil engineer for a period of four years only, to be known as and called the Debris Commissioner.

SEC. 2. Said Commissioner shall, during the time he shall be actually employed in the discharge of his official duties, receive a compensation of three hundred dollars per month and his necessary traveling expenses, to be allowed by the State Board of Examiners.

SEC. 3. Whenever any Board of Engineers of the United States Government shall have been appointed, with power to adopt plans and specifications for the construction of works for the impounding of mining debris, it shall be the duty of said Debris Commissioner to consult and advise with such Board of Engineers of the United States Government, and to examine and pass upon the merits of such works, and said Debris Commissioner shall determine whether or not such works are calculated to and sufficient to protect the navigable waters of the State, and to keep a record of such determinations.

SEC. 4. There is hereby appropriated out of the General Fund of the treasury of this State not otherwise appropriated the sum of two hundred and fifty thousand dollars, no warrant against said sum to be drawn or paid until the United States Government shall have appropriated at least an equal amount, to be used in the construction of works for the restraining or impounding of mining debris in California, said moneys to be paid only upon orders drawn by the Controller, upon the written request of the said Debris Commissioner, and to be drawn only for the payment of not more than one-half of the cost of the construction of any such works for restraining and impounding mining debris as shall have been approved by him and duly adopted and recommended by Engineers of the United States Government appointed for that purpose.

SEC. 5. The term of office of said Debris Commissioner shall be four years from the date of his appointment. He shall take the same oath of office as is provided by law for other State officers, and before entering upon the discharge of his duties shall give bond with sufficient sureties, to be approved by the Governor of the State, in the sum of fifty thousand dollars, for the faithful discharge of his duties as such officer.

SEC. 6. The said Debris Commissioner shall have the power to appoint a Secretary, at a monthly salary to be fixed by said Commissioner, not exceeding one hundred and twenty-five dollars per month; said Secretary to hold office at the pleasure of the said Commissioner; provided, however, that no secretary shall be appointed until said Debris Commissioner shall enter upon the actual discharge of his duties.

[SEC. 7. All expenditures authorized by the provisions of this Act shall be subject to the approval of the State Board of Examiners; and the State Controller is hereby authorized to draw his warrant for all expenditures not in excess of the appropriation herein provided for, so approved by the State Board of Examiners, and the State Treasurer is hereby directed to pay the same.]

The Voorhies Mine Signal Law.

An Act to Establish a Uniform System of Mine Bell Signals, to be Used in All the Mines Operated in the State of California, and for the Protection of Miners.

The People of the State of California, represented in Senate and Assembly, do enact as follows:

SECTION 1. Every person, company, corporation or individual operating any mine within the State of California—gold, silver, copper, lead, coal, or any other metal or substance where it is necessary to use signals by means of bell or otherwise, for shafts, inclines, drifts, crosscuts, tunnels and underground workings—shall, after the passage of this bill, adopt, use and put in force the following system or code of mine bell signals, as follows:

- 1 bell, to hoist. (See Rule 2.)
 - 1 bell, to stop if in motion.
 - 2 bells, to lower. (See Rule 2.)
 - 3 bells, man to be hoisted; run slow. (See Rule 2.)
 - 4 bells, start pump if not running, or stop pump if running.
 - 1—3 bells, start or stop air compressor.
 - 5 bells, send down tools. (See Rule 4.)
 - 6 bells, send down timbers. (See Rule 4.)
 - 7 bells, accident; move bucket or cage by verbal orders only.
 - 1—4 bells, foreman wanted.
 - 2—1—1 bells, done hoisting until called.
 - 2—1—2 bells, done hoisting for the day.
 - 2—2—2 bells, change buckets from ore to water, or vice versa.
 - 3—2—1 bells, ready to shoot in the shaft. (See Rule 3.)
- Engineer's signal, that he is ready to hoist, is to raise the bucket or cage two feet and lower it again. (See Rule 3.)

Levels shall be designated and inserted in notice hereinafter mentioned. (See Rule 5.)

SEC. 2. For the purpose of enforcing and properly understanding the above code of signals, the following rules are hereby established:

RULE 1. In giving signals make strokes on bell at regular intervals. The bar (—) must take the same time as for one stroke of the bell, and no more. If timber, tools, the foreman, bucket or cage are wanted to stop at any level in the mine, signal, by number of strokes on the bell, the number of the level first before giving the signal for timber, tools, etc. Time between signals to be double bars (— —).

Examples:
6—5, would mean to stop at sixth level with tools.
4—1—1—1—1, would mean stop at fourth level, man on, hoist.

2—1—4, would mean stop at second level with foreman.

RULE 2. No person must get off or on the bucket or cage while the same is in motion. When men are to be hoisted, give the signal for men. Men must then get on bucket or cage, then give the signal

to hoist. Bell-cord must be in reach of man on the bucket or cage at stations.

RULE 3. After signal "Ready to shoot in shaft," engineer must give his signal when he is ready to hoist. Miners must then give the signal of "Men to be hoisted," then "spit fuse," get into the bucket, and give the signal to hoist.

RULE 4. All timbers, tools, etc., "longer than the depth of the bucket," to be hoisted or lowered, must be securely lashed at the upper end to the cable. Miners must know they will ride up or down the shaft without catching on rocks or timbers and be thrown out.

RULE 5. The foreman will see that one printed sheet of these signals and rules for each level and one for the engine-room are attached to a board not less than twelve inches wide by thirty-six inches long, and securely fasten the board up where signals can be easily read at the places above stated.

RULE 6. The above signals and rules must be obeyed. Any violation will be sufficient grounds for discharging the party or parties so doing. No person, company, corporation or individuals operating any mine within the State of California, shall be responsible for accidents that may happen to men disobeying the above rules and signals. Said notice and rules shall be signed by the person or superintendent having charge of the mine, who shall designate the name of the corporation or owner of the mine.

SEC. 3. Any person or company failing to carry out any of the provisions of this act shall be responsible for all damages arising to or incurred by any person working in said mine during the time of such failure.

SEC. 4. This act shall take effect immediately.

The Ford Hydraulic Mining Law.

At the last session, the State Legislature added the following two sections to the code:

SEC. 1424. The business of hydraulic mining may be carried on within the State of California wherever and whenever the same can be carried on without material injury to the navigable streams, or the lands adjacent thereto.

SEC. 1425. Hydraulic mining, within the meaning of this title, is mining by means of the application of water, under pressure through a nozzle against a natural bank.

This, as well as the Debris Commission bill was introduced in the Senate by Senator Tiev L. Ford, of Sierra, Plumas and Nevada counties and Mr. R. I. Thomas of Nevada county introduced them in the Assembly. In order that the miners of the State should have a clear understanding of the effect of these bills upon their industry the editor of the MINING AND SCIENTIFIC PRESS interviewed Senator Ford and his statements were given in the PRESS shortly after the bill passed. The interview is here republished, as it explains fully the effect of this and other recent hydraulic mining laws, which are also published in full in this number of the MINING AND SCIENTIFIC PRESS.

"What effect do you think the legislation during this session of the legislature, and especially these two laws of yours, Mr. Ford, will have on the hydraulic mining in this State?"

"Senate bill No. 150 defines the conditions under which hydraulic mining may be conducted. The purpose of this bill was to embody in our civil code the principle that had been established concerning the business of hydraulic mining by our State and Federal courts. As you will remember, the latest expression of judicial opinion on this subject was the decision of the U. S. Circuit Court in October last in the case of the United States against the North Bloomfield Mining Co. The U. S. Circuit Court in that case, after hearing the evidence and the argument, and a personal inspection of the premises by the justice of the court, decided that mining by the hydraulic process could be prosecuted by this company and refused to issue an injunction. The practical effect of that decision was to dissolve a former injunction that had been issued by Judge Sawyer. This former injunction was the result of the famous suit known as Woodruff vs. North Bloomfield Mining Co. This last-named suit is the one upon which is based the main reliance of the Anti-Debris Association, and in all their discussions they quote from Judge Sawyer's opinion in that case and make it the basis of their arguments. The decision of last October by the same court, in a case where the same company was defendant, without overruling the decision of Judge Sawyer, did lay down the rule that not only could hydraulic mining be carried on without material injury to navigable streams and adjacent lands, but that, in fact, one of the largest hydraulic mines in the State of California had actually constructed such restraining works as enabled this very result to be accomplished. The justice who rendered the opinion stated (and this opinion can be readily obtained) that although the water leaving the restraining works was discolored and contained fine particles of comminuted clay, it did not contain or carry any such material as would be deposited in a navigable stream or anywhere when carried by water traveling at the rate of a mile in two hours, and that such material as was carried in suspension in water leaving this mine would be carried through San Francisco Bay to the Pacific Ocean. Senate bill No. 60 contains the principle of this decision boiled down and crystallized into a code section."

"Was there anything in the code prior to this prohibiting hydraulic mining?"

"No, the codes, heretofore, have contained nothing with reference to hydraulic mining. The whole law concerning the business of hydraulic mining was embodied in numerous decisions of the State and Federal Courts, and our State being a Code State and it being the policy of our State to embody all well-known legal principles in our code, and the law governing hydraulic mining having at last become settled by the courts, it was deemed advisable to enact into a code section the principles thus established."

"It will be readily seen that this legislation is very conservative in character. It gives the miner no rights beyond those given him by the decision of the U. S. Circuit Court last October in the North Bloomfield case, but it does definitely determine the conditions that may be imposed upon the hydraulic miner, the rule of evidence that must govern in cases involving this industry, and puts the law into a definite and fixed form and in a code section where all may read and understand it. It places the business of hydraulic mining among the legitimate industries of our State, where it rightfully belongs and, it is hoped, will

tend to put an end to the controversies that have heretofore been detrimental to both mountain and valley interests.

"I might add here that the apparent fear of some of the valley people that this provision may encourage the illegal prosecution of hydraulic mining is wholly without any reasonable foundation. The very law itself prohibits, in effect, any hydraulic mining except such as can be carried on in compliance with its terms, and, as every lawyer in the State of California knows, the code provision is strictly in line with the judicial rulings of our State and Federal courts. Our valley neighbors must give the miners of this State credit for possessing at least a fair amount of intelligence, and their former obedience to laws that wrought havoc and ruin in their midst is a sufficient guaranty that they will abide by the conditions imposed by this, or any other, legal enactment."

"A definition of hydraulic mining was made necessary by the terms of the so-called 'Caminetti Law.' That act provided that the term 'hydraulic mining' should have the definition given to it in the State of California. That portion of Senate Bill No. 50 defining hydraulic mining meets the requirements of the 'Caminetti Law' in this respect."

"What is your opinion, Mr. Ford, in relation to the bill providing for the Debris Commission?"

"That bill, known as Senate Bill No. 389, is wholly and strictly supplemental to the 'Caminetti Act.' It provides that the Governor shall, on or before the first of next January, appoint a Debris Commissioner. This Debris Commissioner has authority to appoint a secretary. The bill further appropriates \$250,000 to be used in the construction of restraining works for the purpose of restraining mining debris. This appropriation, however, does not become available until Congress shall have appropriated at least as much for the same purpose. But when Congress does appropriate that amount, and as much more as it pleases, then this appropriation will become available and must be expended under the direction of this Debris Commissioner. All expenditures under this act are to be subject to the approval of the State Board of Examiners. The intention of the act is to enable California to co-operate with the general government in the construction of works necessary to permit hydraulic mining to be carried on under restrictions and limitations imposed by law."

"Mr. Ford, do you not think, in view of the passage of these laws, both in Congress and in the State Legislature, that the conditions are much more favorable for hydraulic mining than they have been since the original North Bloomfield decision?"

"There is not the least doubt of it. By this legislation both the State of California and the General Government are committed to a policy which cannot result otherwise than beneficially to the business of hydraulic mining. California has said that she will give \$250,000 to aid in the rehabilitation of this industry, provided that the General Government will give at least as much. California has now, through her Legislature, named the conditions upon which hydraulic mining may be resumed, and has shown her willingness to assist hydraulic miners in making it possible for them to comply with these conditions. The General Government, while it has not as yet gone as far as California in this direction, has started out by recognizing the industry and providing legal machinery whereby it may be resumed. The only thing involved now is for the Federal Government to meet the invitation of California and appropriate a sufficient sum of money to construct the required works to enable this industry to be resumed. I should say that the outlook is particularly encouraging. True, our miners must be yet a little patient. They must not for a moment imagine that enterprises of this nature and work of this magnitude can be accomplished in a day. We have gone a long distance in the right direction, and, if the miners are united, firm and persistent, they will get what they are entitled to. There is one imperative necessity. The miners must keep up their organization. Through the State Miners' Association and its branches, they have accomplished what has been done by way of legislation in both Congress and the State Legislature. Too much praise cannot be bestowed upon that organization, its executive committee and its officers. I should like to name personally some members of that association who have done heroic work for the miners, but it is hardly proper for me to do so on this occasion. Suffice it to say that in the Miners' Association, in its prosperity and in its success, lies the success of the cause of the miners. For years the miners have been fighting single-handed and individually against powerful organizations composed of the best men of the valleys, backed by abundance of means and the best counsel they could employ. Now, for the first time in the history of California, the miners have an organization officered by some of the best men of our State, the result of whose work has been such legislative fruit as two years ago was not dreamed of by the wildest mining enthusiast. I wish all of the miners in California could thoroughly appreciate the good work done by their association and the necessity for their continuous and enthusiastic support of it."

A CURIOSITY.—H. T. Tripp, of Tripp's mine near Big Bar bridge, a few days since found in one of the tunnels several beautiful pieces of gold which were shaped like the frond of a small and delicate fern. Several molds of the same shape were discovered in which there was no deposit of gold. Evidently at one time growing ferns were submerged in a liquid substance which solidified into slate, and that a mold was thus formed into which gold was lodged and, by a process of nature, shaped to fit the mold. The gold was found several hundred feet from the surface of the ground, which proves that in ages past the earth in this section was disturbed by volcanic action. Mr. Tripp will send the curiosity to the World's Fair.—Amador Ledger.

Measuring Vibrations of Steamers.

At a meeting of the Institution of Naval Architects a paper was contributed by Herr Otto Schlick "On an Apparatus for Measuring and Registering the Vibrations of Steamers." Herr Schlick stated that he had succeeded in producing an apparatus, to which he had given the name "pallograph," founded on the principle of so hanging a weight that, in consequence of its inertia, it took no part in a given direction in the tremblings and oscillations of the point to which it was suspended. As it appeared necessary, for the purpose of the experiment, to take cognizance of the vibrations in a vertical and a horizontal direction, the apparatus possessed two weights—one which could only move in a vertical and another which could only move in a horizontal direction. Herr Schlick describes the apparatus at length, and proceeded to state the results of a series of experiments which he carried out with it on board the twin-screw dispatch boat "Meteor," belonging to the imperial German navy. The vertical vibrations always attained their maximum when the horizontal were at the smallest, and vice versa. This phenomenon was peculiar to twin-screw vessels only, and was explained by the difference in the number of the revolutions of the two engines and the reaction of the masses of the moving parts. The horizontal direction was exactly the reverse, and the action of the masses of the heaviest moving parts of the engines—the connecting rods and cranks—neutralized each other because they were of equal size, and acted in opposite directions. The older passenger steamers had much smaller dimensions, and the engines, as was well known, ran at much smaller speeds than those of to-day. The smaller the length of the ship the greater was the number per unit of time of its vibrations. There could be no idea of a union between the number of the vibrations and the number of revolutions of the engines of the older type of steamers, and therefore they did not manifest remarkable vibrations. As progress, however, was made in ship-building, the principal dimensions steadily grew, the period of the vibrations became steadily longer, while the necessarily greater engine power which was requisite compelled the increase of the number of revolutions. We had thus arrived at a period when the time of a vibration and of a revolution of the engines agreed, and when for the moment the usual type of ship showed severe vibrations.—The Colliery Guardian.

Rapid Transit in New York.

Rapid transit in New York, through the Manhattan Railway Company, has been decided upon by the Rapid Transit Commissioners, and it is probable that the former will eventually accept the terms offered, although at present they are protesting, as might have been expected, against them. The plan involves the following: First: A line from the Battery, along West and Barrow streets, to Bedford street, thence across Bedford, Commerce, Morton, Bleeker and Cornelia streets to the present Sixth avenue line at West Third street. Second: A line from the Ninth avenue line near 108th street, along 108th street, the Boulevard, Hamilton place and Tenth avenue to Fort George. Third: Within two years the present Ninth avenue road is required to be converted into a four-track railway between Barrow street and 108th street, with both express and way stations at Fourteenth, Forty-second and Fifty-ninth streets. Fourth: A third track on the Sixth avenue line is required between Eighth street and the junction of the new line at West Third street. Fifth: The foundations and structures of the lines provided for and the four-track line between Barrow and 108th streets, as well as all parts of the present system that shall be reconstructed, shall be such as to permit the running of five-car trains at a speed of 35 miles an hour between stations. The foundations and structure of the new line shall admit of the construction of four tracks thereon and shall have three tracks to begin with, excepting the part between Battery place and Sixth avenue, and within three years of the completion of the branch line or extension to Fort George a branch line with not less than two tracks shall be built from 162d street, along the Klgsbridge road and Broadway, to the northern city limits. All the above improvements provided for south of Fort George shall be completed within two years after the acquisition of the consent of the property-owners and municipal authorities for right of way. The company is given the option to lay and construct a fourth track from Greenwich street to Barrow street and

Battery place, in addition to the fourth track hereby authorized and required on the Ninth avenue line. The franchise shall be subject to the right to construct and operate the underground road heretofore laid out by the commission, or that may be laid out hereafter, under the Boulevard. The Manhattan Railway Company is required to pay into the city treasury all the expenses of the commission since its organization and any that may be incurred by it in the future, and shall pay annually five per cent of its net receipts, meaning thereby its gross receipts less taxes and operating expenses.—Electrical World.

Bullet-Proof Textures.

Two Teutons awoke one morning last week to find themselves famous, says *Iron*. We refer, of course, to Herr Dowe, of Mannheim, and Herr Scarneo, of Vienna. Because these worthy gentlemen have simply improved upon the well-known redskin plan of loosely placing a wet blanket in front of the person pattering up against which rifle bullets fall harmlessly to the ground, they have during the past few days had interviewers not only to the right of them, to the left of them, and in front of them, but generally all over them, against whose volleys—of questions—even the now famous coat of mail has not been invulnerable. Curiously enough, the idea of the hemp or cement and Sheffield steel-wire netting protection will be found to be far from new. If we mistake not, it dates from a period not long anterior to the invention of the rifle itself. Our Iron Duke is said to have had a bullet-proof jacket submitted to him by an inventor, who incontinently decamped when Wellington requested him to don the garment, and simultaneously ordered a couple of fusiliers with loaded rifles into the room. Then there was the individual who, struck by the success of the method adopted by one of the Carlist regiments of carrying a sheet-iron screen in its van, invented a protective covering somewhat after the style of the Dowe-Scarneo material. But there seems to be no doubt that the much-noised German-Austrian composition cannot effectively be used as actual wearing apparel. In the first place, the substance is not sufficiently flexible; secondly, the soldier, especially in summer, would scarcely be able to bear the heat induced by it, even if he could afford to support its additional weight. Then the appearance of the uniform must be considered. The coat, if not absolutely—so to speak—Dowe-dy, would scarcely be picturesque. On the whole, therefore, it is not at all improbable that when the customary nine-days' wonderment aroused by the advent of the bullet-proof textures has subsided, we shall hear very little more about them. Herr Mannlicher, who devised one of the best rifles ever placed in the hands of a soldier, has not an encouraging opinion of them.

WHAT IS STEAM?—The above question is frequently asked of engineers nowadays, and, although, they make constant use of steam, very few will answer that "steam is an invisible gaseous fluid, generated by the aid of heat from water." Many of them, when told that steam is invisible, laugh and say they know better, because they see it every day. If one of these wise men who claim the honor and name of practical engineers will take a look at the water-glass in the boiler-room, if they have one—if not, let them look at the one on their neighbor's boiler—and then tell if they can see any steam inside of it. If the glass should happen to burst while they are making the observation, they will, no doubt, see plenty of what they call steam in the vicinity, and they might also see the same if the safety valve should happen to blow off. Why, then? Simply because steam is invisible, and so long as it is confined you cannot see it, but when it is cooled off, as when it comes in contact with the air, and is consequently condensed again to the water from which it originated, it becomes visible to the eye, like water in very small particles, as in a fog. Viewed at such times it has lost its characteristics as steam, and instead of being a gaseous fluid it has become condensed to water in very small particles, which occupy considerable space. When in this condition we see what we call steam, but when an engineer notes the flow of steam from gauge cock or safety valve, he will notice that near the opening nothing is visible, while at some distance he sees fog. The reason of this is that at all times steam is invisible while it remains steam, but by condensation and the formation of water a fog is produced, which can be seen and distinguished in no way from the fog which rises from rivers, swamps, or other bodies of water during such times as the temperature and other conditions are favorable to its formation.—Machinery.

Scientific Progress.

Prehistoric Remains in America.

There is one fact in regard to the prehistoric and protohistoric remains of North America which does not appear to have received the attention it deserves.

If we examine carefully the descriptions and figures of these remains so far as published and attempt to classify them, we soon find ourselves forced to admit that there are two well-marked, general classes of types, the one belonging to the Pacific and the other to the Atlantic slope. The characteristics which distinguish these two classes are both numerous and well-marked. Geographically, the Rocky-mountain range appears to be the dividing line as far south as the Rio Grande, Mexico, and Central America, belonging to the Pacific-slope section.

Although the remains of the Pacific division present many types, varying in the different sections, yet there is such a strong general resemblance, on the one hand, of those found from southern Alaska south to the Isthmus (excepting a gap in California), and, on the other hand, such a strong contrast with those of the Atlantic slope as to justify the conclusion that this arises from ethnic distinctions and indicates different races. Mr. Swan has long been calling attention to the resemblance between the types of the region inhabited by the Haida Indians and the remains of Mexico and Central America, and no one who will make the comparison will fail to be convinced. Professor Dall, who has studied the manners, customs and remains of the Northwest Coast, reaches the same conclusion. I cannot enter into details in this brief article, but ask any one who doubts the correctness of this conclusion to compare the figures given by Ensign A. P. Niblack, in his work on "The Coast Indians of South Alaska and Northern British Columbia," with those found on the monuments of Mexico and Central America, and then with the types of the Atlantic slope. It is true that the former are modern, yet the resemblance both in general character and combination to those of Mexico and Central America is too marked to be overlooked, while no such resemblance to those of the Atlantic slope is observable.

Do not these resemblances on the one hand and differences on the other have an important bearing on the question, "From whence did America (or rather North America) derive its original immigrants?" That the works of the two slopes present two distinct classes of types cannot be denied. That there is in California a break in the continuity of the types of the Pacific slope, which seems to indicate an overflow from the Atlantic side, only seems to emphasize the above conclusion. The marked similarity between the types of the Pacific slope and the Pacific islands has been referred to by Professor Dall (3d Ann. Rep. Bur. Eth., pp. 147-151), who finds that they have prevailed "from Melanesia to Peru and from Mexico to the Arctic." In summing up, he remarks that "the mathematical probability of such an interwoven chain of custom and belief being sporadic and fortuitous is so nearly infinitesimal as to lay the burden of proof upon the upholders of the latter proposition." Professor Dall does not argue from this a common origin of the people possessing these characteristics, but believes they have been "impressed" upon the inhabitants of the western coast from the Pacific side. Notwithstanding this disclaimer, does not the evidence indicate two streams of original immigration, one to the Atlantic and the other to the Pacific coast? Ensign Niblack, although disclaiming any inference to be drawn therefrom as to relationship, gives a list of resemblances between the customs and works of the New Zealanders and Haida Indians that is certainly remarkable.

The idea that America was peopled by way of Behring straits is somewhat losing its hold on the minds of students, and, as a usual result, there is a tendency to swing to the opposite extreme. Drs. Brinton and Hale are inclined to believe, chiefly from linguistic evidence, that the first settlers came from Europe to the north Atlantic coast. The former says in his "Races and Peoples," pp. 247-248: "Its first settlers probably came from Europe by way of a land connection which once existed over the north Atlantic, and that their long and isolated residence in this continent has molded them into a singularly homogeneous race, which varies but slightly anywhere on the continent and has maintained its type unimpaired for countless generations. Never at any time before Columbus was it influenced in blood, language, or culture by any other race."

Now it may be that settlers came from

Europe to the north Atlantic coast, but the evidence is decidedly against the remainder of the above-quoted paragraph, which is, in fact, somewhat self-contradictory. For, if the settlement was at one point, by one race, and this race was never influenced by another, it is difficult to imagine in what respect the molding process acted. However, the chief objection is to the theory of a single original element, and the assumption that it was never influenced in pre-Columbian times by any other race or element. The facts set forth by Professor Dall and confirmed by Ensign Niblack are too apparent to be set aside by any theory or mere declaration. Even without the evidence presented by these parties, the differences between the archaeological types of the Pacific and Atlantic slopes are sufficient to outweigh any argument that has been presented against intrusive elements.—Cyrus Thomas, in *Science*.

Light in Photography.

The action of light in the production of "latent" images, says the *Optician*, affords one of the most obtrusive of the unsolved problems of optical science, and without, for the present, going to the extent of proposing any new theory, we offer the following observations, in the belief that they may be of some interest to a considerable number of our readers:

It was taught by Mendeleeff that "molecules consist of atoms in a certain state of distribution and movement, just as the solar system is made up of inseparable parts (the sun, planets, satellites, comets, etc.)" and again ammonia may be represented in the simplest manner by supposing the sun, nitrogen, surrounded by its planets of hydrogen; and common salt may be looked on as a double star formed of sodium and chlorine." A similar hypothesis has been advanced by Boltzmann and adopted by Crookes, and it has been recently referred to in an interesting article in our contemporary *Photography*, the "double star" dealt with being the molecules of silver and bromine.

The hypothesis that the cumulative action of light is in some cases a purely physical one is undoubtedly very attractive, and we may say at once that an article is under consideration and may be published in course of time in *Science* *Stiftings*, in which suggestions that light acts between photosensitive molecules partly as "radiation pressure" and partly also through the agency of *tides* (not necessarily wholly material, involving the relative motions of parts of the molecules, but perhaps electrical, involving only the molecular charges) will be introduced and discussed. The fully-accepted idea appears to be that photography is always dependent upon the absorption of light in the accomplishment of intramolecular work.

If there is anything much in the idea of radiation pressure in this connection (which we do not assert), it may be that a latent image can be impressed without absorption of light. But we prefer to consider that the process is not a direct effect of light, but rather one of intramolecular vibrations, the electric, kinetic, magnetic and other out-of-the-way image-forming forces being simply excitants, capable, like bell-hammers, of setting the molecules ringing in their natural tones. Accepting and using for the moment the "double star" hypothesis above alluded to, the adaptation of possible continuous and "tidal" actions to the explanation of reversal, with loss of sensitiveness, affords a wide field for speculation. Apart from the loss of sensitiveness, the alternate reversals suggest comparison with the beats of tuning forks, etc., as if the tidal actions between the molecules were very slightly out of phase.

THE canals on Mars, says Dr. A. Tooska, in *Die Natur*, are simply rifts in the crust of that planet, due to collisions with one-time satellites. To support this theory, he says that one of the present satellites of Mars, "Phobos," revolves around that planet at a distance of only 806 miles, and is within the limit where the attraction of gravitation is in equilibrium with the centrifugal force. It is approaching Mars at an ever-accelerating rate, and in a few decades, perhaps, it may strike the planet at a lower angle, and running along its surface, make another "canal." It would form two parallel elevated crests, which, after cooling, will be covered with snow and ice. Under the great heat of contact ice would be melted, and the furrow filled with water. This water would again freeze and present the bright line, relieved by the shadows of the high mountains, familiar to observers. Mars, in its eccentric orbit, passes through the orbits of numerous other planetoid bodies, and may have had frequent collisions with them.

SPECIALTIES

OF

HYDRAULIC MINING MACHINERY.

In the adjoining column we present the specialties of Hydraulic Mining Machinery built by the Joshua Hendy Machine Works, who have their principal office at No. 51 Fremont Street, this city, and who have, also, an extensive, large and commodious foundry and machinery constructing plant in the block bounded by Bay, Kearny and Francisco Streets, near the sea-wall, in the northern portion of the city.

These Works have, for years past, made a specialty—in connection with other departments of mechanical business in which they have been and are now engaged—of the building and furnishing of Hydraulic Mining Plants, in which are comprised Hydraulic Water-pipe, Hydraulic Giants, Hydraulic Gravel Elevators, Water-gates, Reservoir-gates, Air-valves, and all of the necessary and required outfittings for Hydraulic Mining Plants under any specifications and conditions of use.

HYDRAULIC GIANTS.

Certain improvements have been introduced into the construction of the form of Hydraulic Giants presented in the cut; these improvements relate to that class of apparatus for hydraulic mining in which a jointed nozzle is used to direct a stream of water against an auriferous gravel bank or other workings, which consists in a novel method employed in the construction of the ball which forms the joint of the nozzle-pipe.

The object of this improvement being to, and necessarily does increase the discharging capacity of the nozzle.

To prevent a rotary motion of the water after its discharge from the nozzle-pipe, vanes or rifles are inserted in the pipe. These rifles are so arranged as to force the water to issue in a straight line from the nozzle, which prevents the scattering of the stream, on the solid or columnar form of which so much of its effectiveness depends.

DEFLECTORS.

In the larger sizes of Giants, deflectors or deflecting nozzles are used, by which the stream of water can be directed or deflected at any angle and to any point with the greatest facility.

HYDRAULIC MINING PIPE.

In the early days of hydraulic mining canvas hose was used, but in the progression of events the discovery of the superiority of wrought-iron riveted pipe was made known and has since been adopted.

These Works are prepared to furnish pipe of all sizes and strengths of iron and recommend that they should be made of graduated strength, according to the pressure to be resisted. They should be larger and lighter near the pressure box at ditch or reservoir and smaller and stronger near the nozzle.

WATER GATES.

The cut on this page illustrates an improved form of Water-Gate built by these Works; the parts which have to sustain the maximum strain or pressure, it will be found, are thoroughly ribbed and thereby made durable, at the same time preserving an elegance of form.

These Works further furnish Reservoir Gates for either Masonry, Wooden or Earthen Dams.

HYDRAULIC GRAVEL ELEVATORS.

We further refer to the illustration presented of an Hydraulic Gravel Elevator in position. The principle upon which the operation of these Hydraulic Gravel Elevators is based is the simple fact, which is well-known by hydraulic miners, that water and gravel can be driven up hill by hydraulic force, and that in a flume it is only necessary to give the impelling water more velocity to make it carry more earth or gravel before it. Miners, to accomplish this, give their flumes more grade. It is, therefore, only necessary to give water more velocity than it has through an ordinary flume to make it acquire sufficient force to carry gravel up an inclined plane. This fact suggested the construction of a form of machine which should so direct and confine the inherent hydraulic force of a stream of water as to impel before its power masses of earth or gravel or other heavy material, and the cut herewith illustrates the features of the machine devised for the accomplishment of that purpose, and to which the attention of those controlling shallow placers is especially requested.

In view of the fact that enactments have been recently passed by the Congress of the United States, entitled the "Caminetti Bill," and measures adopted by the Legislature of our State of California, we believe that hydraulic mining can yet be successfully undertaken, and to those who are now or may intend to become interested in this industry, we ask attention to the specialties here presented.

Hydraulic Gravel Mines of California.

We desire to call the attention of miners to our new hydraulic machine, or HOSKIN'S NEW GIANT, which is the best machine ever offered. We have dispensed with the center bolt, used in the old style, and which was so liable to catch trash.

There is a clear waterway through, and the capacity as to No. of size is also greatly increased. The horizontal and vertical motions are made with only one joint, and that a very durable one, and easily kept in order. The weight is reduced about 20 per cent, thus lessening the cost of transportation, and without decreasing the strength. This style of machine is also the easiest to work of any yet tried.

THE HOSKIN'S GIANT has earned a reputation which places it ahead of all competitors. Its ingeniously constructed deflector enables the operator to control the course of the stream with utmost ease and precision.

The deflector is an indispensable adjunct to all hydraulic machines. With it ten pounds force at end of lever will move the pipe in any direction with the greatest facility and the stream can be directed to any point with certainty; a rock pile can be stirred up or a sand streak followed and all operations accomplished with perfect ease.

We are agents for the Pacific Coast of these Improved Giants, and are also sole agents for all foreign countries.

Matheson Patent Lock-Joint Lap-Welded Pipe.

The Advantages of It Are:

SIMPLICITY IN CONSTRUCTION, permitting handling without the aid of skilled labor.

A RELIABLE JOINT, whether used on light or heavy tubing.

A SAVING IN COST OF TRANSPORTATION, as compared with any other style of wrought or cast iron pipe.

A SINGLE CONNECTION AT EACH JOINT, where other kinds have a double one.

This pipe is now used to a great extent by many of the largest natural gas lines in the country, as well as for water and many other purposes. External diameters of either standard Wrought Iron Pipe and Tubing can be furnished, and of ANY DESIRED WEIGHT OR GAUGE, in connection with the MATHESON PATENT LOCK-JOINT, and in maximum lengths and diameters, as follows:

2 inches to 4 inches diameter, 16 to 20 feet long.
5 " " 8 " " " 20 " 26 " "
9 " " 12 " " " 20 " 25 " "
13 " " 20 " " " 20 " 24 " "

We carry in stock Pipe with the M. L. J. for nominal pressures of about 100 to 300 pounds.

NEW DISCOVERY.**Mines Revived and Miners Enriched**

By the wonderful **MacArthur-Forrest Process**,
Controlled by The Gold and Silver Extraction Mining
and Milling Co. H. A. W. Tabor, Pres.; LEONARD GOW,
V. Pres.; H. A. JONES, 2d V. Pres.; P. GOW, Techni-
cal Mgr. and Asst. Treas.; T. L. WISWALL, Gen'l Mgr.
and Secy; PETER McCOURT, Treas.; W. L. COOPER, Eng.

TRADE MARK.

GLASGOW WORKS:
The Cassel Gold Extraction Co.,
Also in Limited, Scotland, Africa,
New Zealand, Queensland, Etc.

General Office of Company:
Rooms 8, 9 & 10, Tabor Grand Opera House
Block, DENVER, COLORADO.

Also mills in operation as follows, viz: The Denver Mill,
Denver, Colo.; The Livingston Gold Mining Co., Boulder
Co., Colo.; The Puzler Gold Mining and Milling Co.,
Boulder Co., Colo.; The Cripple Creek Gold Extraction
and Power Co., Colo.; Calumet Gold Mining Co., Middle
Creek, Shasta Co., Cal.; The Shasta Gold Ex. Co., Mid-
dle Creek, Shasta Co., Cal.; The Mercur Gold Mining
Co., Folsom, Utah; Champe's Mines, Hamling Dis-
trict, Yavapai County, Ariz.; The Crowned King and
Last Chance Mine, Yavapai Co., Ariz.; The Union Mines,
Maricopa Co., Ariz.; The Revenue Con. Gold Mining Co.,
Revenue via Norris, Mont.; The Creighton Mining &
Milling Co., Creighton, Cherokee Co., Georgia; and
others in course of erection.

The object of this company is to introduce the Mac
Arthur-Forrest process.
We have purchased from the Cassel Gold Extraction
Co., of Glasgow, Scotland, the exclusive right for the
United States to use patents covering this process.

If you desire an experimental test communicate with
the secretary.

If the results of the tests are favorable, we will then
make arrangements to treat a quantity of not less than
five tons at Denver.

We are fully prepared to grant royalties to mine and
mine owners, or rights covering districts and counties.
The process consists of pulverizing the ore to a fine-
ness of about 60 mesh, and then subjecting the same to
an action of a very diluted solution of cyanide. A few
tubs especially constructed according to our diagrams,
for triturating, settling and filtering, is all that is re-
quired extra in connection with any kind of pulverizing
stamp or rolls.

The total cost, as a rule, does not exceed from \$2.50
to \$5.00 per ton.

The most desirable class of ores for this process
be so-called refractory gold ores, pyrites, hematite
manganese and tellurium. We have also treated suc-
cessfully dry silver ore.

We will be pleased to answer any inquiries and fur-
nish any desired information. Address,

T. L. WISWALL,
P. O. Box 926. Gen. Mgr. and Secretary.

Electricity.

The Arc Light as a Standard of Light.

Mr. Blondel suggests using the light from the crater of an arc lamp as a new secondary standard, for use specially in measuring white light such as that from the arc. He calls attention to the fact that the temperature of the arc is constant and independent of the current, and he has found that the brightness of the crater is also constant within wide limits of the difference of potential, the current, and the nature and composition of the carbons. To use this as a standard, he places the carbon at an angle of 20 degrees with the vertical, in which case the crater will be inclined 50 to 60 degrees, and will be completely visible for an arc of from four to five millimetres; it is not necessary that the light is emitted perpendicularly to the surface of the crater; in front of the arc is placed a screen with a small conical aperture; this screen is made double so as to allow water to circulate through its interior, or a porcelain screen may be used. Over this screen is placed a small disc, having different sized holes, and a small lens, any of which can be brought in line with the opening; the screen is placed within two to three centimetres of the arc; an opening of one square millimetre is found to give the best results. The effect of this screen is to focus or to cut off, as it were, all the light except that from the crater; the photometer is then placed in line with this conical beam of light. To assure oneself that only the light from the crater is used, the small lens above mentioned is placed in front of the hole, in which case a magnified image of the arc will be formed on a screen at the end of the photometer, from which it can be seen whether the light entering the photometer is that from the crater and not from the rest of the arc. A magnet may be used to direct the arc so as to keep the crater from changing its position; 70 to 75 volts (including the rheostat) and 0.2 amperes per square millimetre were found to give the best and most stable results; for instance, with 15 millimetre carbons, 75 volts, 40 amperes and 5 millimetres arc. He suggests that the Chicago Congress adopt as a secondary standard of light that emitted from the crater of an arc lamp; its value could be determined once for all in terms of the absolute standard. As it is not an absolute standard, it cannot be used as such, but merely as a convenient secondary standard. A full, illustrated description will be found in the bulletin of the *Soc. Int. des Electriciens* for March, and an illustrated abstract in *L'Ind. Electrique*, March 25th. (This proposed standard appears to be very similar to the one suggested by Mr. Swinburne.)—*Electrical World*.

The Saleve Mountain Electric Railway.

The London *Electrical Engineer*, March 24th, gives a short description, including considerable data, of this rack and pinion mountain road. The generating station consists of three turbines of 250 horse power each; their speed is only 45 revolutions and the horizontal dynamos are coupled directly on the turbine shaft; as this speed is exceedingly low, dynamos of a normal output of 1000 horse power are used in order to give the required power at this low speed; they are among the largest continuous current dynamos yet constructed, being ten feet in diameter and weighing nineteen tons. The generating station is about one and one-quarter miles from the central railway station; the conductors are carried overhead on telegraph poles and include two pressure regulating return wires; the conductor consists of a rail between the tracks resting on porcelain insulators; the current is taken off by means of a sliding shoe; the other rails are used as a return circuit; the loss in the lines is 15 per cent; the cars carry forty passengers and weigh complete, twelve tons. There are two motors operating cogwheels which gear into the rack; either is capable of bolting and starting a loaded car on a maximum grade, the motors are four-pole Thury dynamos of about 30 horse power; the speed of the car varies from 5 to 9.5 feet per second. Each car has four friction brakes, two electric brakes and two absolute stops; the electric brakes are formed by the motors themselves, which act as dynamos during the descent, their current being dissipated in resistances placed under the cars. The sides of the observation cars are almost wholly composed of glass windows. Each car has three axles, the middle one carrying wheels without springs; each one of the others has one loose wheel to facilitate turning the curves. The line is divided into three sections of about three kilometres each; about 250 horse power are required for ordi-

nary working; the maximum speed is six miles an hour and on 25 per cent grades three miles an hour; the upper station is 3800 feet above the sea.

Is Electricity a Myth?

In its practical, serviceable relations, assuredly no. But there is an active debate in progress, says the *Mechanical News*, among scientific scholars on the question whether there is, after all, such a thing as electricity, using the word "thiog" as implying a material entity—or whether it is merely an effect, or to speak more technically, a mode of motion. If the latter theory is accepted by the scientific world as correct, electricity will still be in very respectable company, for both heat and light have gone that way before. Not very long ago they were supposed even by philosophers, to be actual substances, not exactly tangible or ponderable, but still having a positive material existence, and liable some day to be weighed and measured, manipulated and transported like any other commodity. Practically, of course, this is done when a ton of coal or a pound of candles changes hands. But in any of these cases it is only the vehicle or agent which is visibly dealt in, and it will only be by a figure of speech that we shall ever ask for a hundred weight of heat or a gallon of light. The analogies of the case seem to point to the same conclusions, as regards electricity. What goes by the name of electricity may be generated and stored, and it is so treated for a multitude of familiar uses; but only in this view of the case, as light is stored in a gas tank or warmth in a cord of wood.

Possibly the question is not of much moment save as a topic of abstract controversy. But speculative inquiries such as this have led and will in many instances lead to results of vast practical usefulness to mankind.

GAS AND ELECTRICITY.—One often hears the statement that electricity for lighting purposes is making such headway that by it the use of gas is being displaced and less gas is being used. A careful study into the great strides made by the gas business since electric lighting has been introduced will show, as we have always contended, that such is not true. Most of the large gas companies, both here, abroad and in America, have increased their plants materially during the past few years, and continue to do so. In Berlin, for instance, the central electric stations supply at least 100,000 lamps besides a large number of private installations; and notwithstanding this, the consumption of gas has steadily increased, and the Corporation of Berlin has recently decided to build another gas plant with a capacity of about 12,400,000 feet per day. In Leipzig and other German cities there has been a proportionate increase. For illustrations we do not need to go very far from home. The gas companies in some of the American cities have also increased their plants. If there were no such thing as electric lighting the consumption of gas would most likely be greater than it is; yet it is surprising how the introduction of electricity is always attended with an increased demand for gas. One of the principal reasons for this is the cultivation of the public taste up to a higher standard of illumination. The electric light is so fine an illuminant, and with its use so much better results are obtained than with the use of the old methods, that the users of gas desire a higher candle-power and better gas, and use more of it than they formerly did.—*Machinery*.

RAILWAY LINES.—The Temps stated that the total length of railway lines in Europe, at the end of last year, was 142,658 miles, or 2590 miles more than at the end of 1891, this being equivalent to an increase of 1.85 per cent. The 142,658 miles of railway are distributed as under: Germany, 27,130 miles, with an increase of 317 miles; France, 23,715 miles, with an increase of 655 miles; Great Britain and Ireland, 20,435 miles, with an increase of 50 miles; Russia and Finland, 19,420 miles, with an increase of 85 miles; Austria-Hungary, 17,540 miles, with an increase of 655 miles; Italy, 8240 miles, with an increase of 175 miles; Spain, 6330 miles, with an increase of 155 miles; Sweden and Norway, 6150 miles, with an increase of 160 miles; Belgium, 3315 miles, with an increase of 62 miles; Switzerland, 2045 miles, with an increase of 50 miles; Holland and Luxemburg, 1925 miles, with an increase of 11 miles; Roumania, 1590 miles, with no increase; Portugal, 1430 miles, with an increase of 105 miles; Denmark, 1320 miles, with an increase of 18 miles; Turkey, Bulgaria and Roumania, 1074 miles, or no change; Greece, 572 miles, with an increase of 87 miles; Servia, 337 miles, and Malta,

7 miles, in neither of the two latter cases there being any change.

ELECTRIC DECK PLANER.—An electric deck planer has been devised by Mr. Malcolm Sutherland, an electrical engineer of Scotland, and it is in use by a well-known ship-building firm of Dumbarton, Scotland. The machine, as made and used by this firm for planing the decks of ships built in their yards, is exceedingly simple in construction, and resembles a lawn mower in form, being handled in the same way, and it is started with as much ease. A steel base-plate is mounted on rollers, and to the under side of this the revolving cutter is attached, whilst the electric motor is placed on top and geared to the cutter by spur wheels, which are covered by an iron guard. The front roller is of the same length as the cutter, so that in passing over the deck it lies on the crests of the uneven parts of the deck and keeps the machine practically level. The hind rollers are set in so that they follow in the wake of the cutter. The machine is fitted with eccentric bearings, and by moving a lever they can be raised or lowered, thus making the cut greater or less as required. The results obtained are very satisfactory, as it is a great advance on hand work so far as regards time, while it relieves the men of a very disagreeable job, as deck planing by hand involves kneeling or sitting on the deck in a most uncomfortable position.—*Electrical Age*.

Useful Information.

Training a Horse.

A horse should never be deceived by word or action. When a rider or driver pulls the reins and says "whoa," he should mean it and stick to it. But to cry "whoa," jerk the reins and lash the horse at the same time, is confusing and means nothing. It is quite common to say "whoa" when it is only intended to go slower or when the horse has not stirred a foot, to let him know of your presence. One day, when your life may depend upon a "whoa," you will find that your horse is not stopped by it because you have entirely played it out of him. Speak always in a natural tone of voice under all circumstances. Always let your horse face the object of his fear, and when frightened remember the slower you move your horse the more power you have over him. There are times when letting a horse trot is almost as bad as letting him run away. Fear is something a horseman should never exhibit in his countenance or voice, as the horse is a close observer and soon learns to take advantage of such indications to become careless of control, if not, indeed, aggressive. Let your lessons be thorough but not very long. Be gentle and patient with the colt, but make the willful, stubborn horse feel the full extent of your power till he submits.

The way to educate a horse not to be afraid of things is to get him used to them by bringing him into frequent contact with them. If the horse is afraid of the report of firearms, just throw him down and fire off a pistol over him. Whenever he makes a motion to get up pull the strap that holds him down and fire off the pistol again. This can be repeated and a lesson should last 30 or 40 minutes. The next day give him another lesson, and in about three days the horse will pay no attention to the discharge of firearms. Another cause of trouble is restiveness, which comes from bad handling and from a too eager disposition. It tells of a nervousness or impatience which develops easily into a multitude of vices, such as rearing, backing, bolting, balkiing, and even viciousness in shoeing when badly handled. The restive horse can easily be made an inveterate balker. It is difficult to cure when it becomes a confirmed vice. Gentleness and patient firmness of the trainer must cure and prevent. Many an ambitious horse is ever ready to start, unless he has been taught never to start until the word is given. It is easy to train the average horse not to start unless the lines are drawn and the word given. Horses are less to blame than drivers for the habit of starting too soon.—*Kansas Farmer*.

The Age of the Earth.

Among the wider problems of natural science toward the solution of which contributions have been made during the last month, the most striking is that of the age of the earth. Mr. Clarence King, the well-known American geologist and explorer, contributes an elaborate article on the subject to the *American Journal of Science* (ser. 3, vol. xlv., pp. 1-20, pls. i., ii.), in which he claims

to have advanced Lord Kelvin's method of determining the earth's age to a further order of importance. He discusses the experimental investigations of Dr. Carl Barus on the effect of heat and pressure on certain rocks, and particularly selects the case of diabase, which has a specific gravity approximately equal to the average specific gravity of the earth's crust. In the light of the new facts, he then reconsiders the probable rate of cooling of the earth, rendering more precise the conclusions of Lord Kelvin. As the result of the detailed discussion, Mr. King concludes that the earth's age probably does not exceed twenty-four millions of years—in fact, that the estimate of the physicists is approximately correct, while that of the geologists is "vaguely vast."

Stocking California Streams With Fish.

The Fish Commissioners of California propose to stock the upper part of the Sacramento river near Delta with black bass this year. Although some sportsmen object to the stocking of this beautiful stream with bass, because they are said to be big enemies of the trout, Commissioner Murdock has been informed that the bass and trout live on friendly terms, which assertion, he says, can be proven correct by the keeper and anglers who fish in San Andreas lake. The bass may kill numbers of small fishes, but as a general thing young trout can keep well out of the way of the ravenous sticklebacks when they have a sufficient amount of water to paddle their own canoe. It is also proposed to stock a part of Eel river, about thirty miles north of Ukiah, with black bass. The experiment of stocking the Russian river has proven a success, and now bass from two to three pounds in weight are enjoying the cool waters of that swift-flowing stream. An attempt will be made to introduce the fresh-water eel on this coast. Experienced pisciculturists contend that no better river than the Sacramento could be named for that purpose. The fresh-water eel is a delicious fish, and is highly prized by epicures of the old countries. The Commissioners, however, expect to hear from some source that the eel is destructive to salmon spawn.

Reports have been received from the San Joaquin river that Chinese fishermen are catching small striped bass in the sloughs near Antioch by means of small-meshed nets, which are dragged along the sloughs where the bass are known to frequent.

The following are the rivers and streams of this coast which have been stocked within the past year with Eastern (New Hampshire) trout: Garcia river and tributaries, Mendocino county; Olema creek, Marin county; Austin creek and tributaries, Sonoma county; Pescadero, Smith and Buteno creeks, San Mateo county; San Lorenzo river and tributaries, also Laguna and Soquel, Santa Cruz county; Calaveras creek and Austin gulch, a tributary of the Los Gatos creek, Santa Clara county; San Antone creek in Calaveras county; Hal-leck gulch, a tributary of Nicasio creek, Marin county; San Vicente, Granite and Scott creeks, Santa Cruz county; also some streams in Sonoma and Placer counties have been stocked by the most handsome of American fresh-water trout.

It is yet too early, according to the Commissioners, to predict the success or failure attached to the stocking of the waters mentioned with Eastern trout. None of the youngsters resembling New Hampshire trout in appearance have been caught so far this year, and the Commissioners fear that their efforts in this direction will prove of small value. The general opinion, Mr. Redding says, is that the Eastern trout follow the example of the home production—the steelhead—and leave the coast streams at the end of the winter season for the ocean, and that they also lose their brilliant markings and take on a silvery coating, which makes them resemble young steelheads in every particular.

SKIN DISEASES IN CALIFORNIA.—Dr. L. P. Simmons of Sacramento, at the recent Sanitary Convention in this city, read a paper on "Skin Diseases in the Central Part of California." The climate, he said, keeps the skin in a normal condition, and has a great deal to do with the lack of skin troubles in the central sections of the State. Then, too, the people here are not crowded together as they are in the East and in Europe, and so parasitic skin diseases are of comparatively rare occurrence, but in this connection Dr. Simmons said that among the Chinese there are very few cases of parasitic diseases, notwithstanding the unsanitary way in which they crowd together. Leprosy, he said, may be bidden for a long time, and personal contact may spread the

disease even before a sore breaks out on the body. Dr. Simmons reported four cases of leprosy in central California, and gave a short history of each case. He also cited the case of an almost full-blooded negro of Sacramento, who in the last few years has become afflicted, or otherwise, according to how the case is looked at, with the disease called "vitiligo," and as a result he has turned from a rich polished ebony hue to pure white. He is not at all proud of his metamorphosis, and has positively refused to exhibit himself. He still has a black spot under each ear, which he cherishes as he would his eyesight, but even these spots are slowly leaving him, and within a year he will be, as far as color goes, a Caucasian. Dr. Simmons says that this case is the most interesting that he has heard of.

A discussion followed in which leprosy took up the most part, and other causes were cited. Dr. Regensburger also mentioned a few more skin diseases and described their symptoms. The case of leprosy that appeared in the City and County Hospital quite recently was also brought up, and the woman's symptoms described and discussed.

THE total number of vessels in the British mercantile marine, says Lloyd's latest returns, is 21,542, with an aggregate tonnage of 12,203,761 tons. Of this number 7,960 are steamers with 8,980,203 gross tons, or an average considerably over 1,000 tons each. Last year England added 872 vessels of 984,670 tons, of which 21,000 tons were purchased from foreigners. But England also sold to foreign nations, chiefly Norway, France and Germany, 117,000 tons more than she purchased. In the last six years nearly four and a half million tons of steamers have been added to the register, and only 1.6 million tons have been removed; and of the latter the greater number have only changed flags and are still competitors for trade. In the same period 913,000 tons of sailing ships have been added on 1,206,000 tons removed; so that there are fewer sailing ships on the register now than in 1887.

A WELL KNOWN ARCHITECT AND ENGINEER tells the *Sun* that it will not be long before all the public halls and theaters are ventilated in the same way as Carnegie Music Hall. At present this building is unique, in that it is supplied with air through perforations in the roof, the exhaust taking place through the "risers" under the seats. The air can be supplied so fast that the freshness and temperature are kept nearly at the normal, and the gallery, instead of being the worst place in the house, is the best, in so far as it is close to the air supply. This mode of ventilation is only possible, however, where electric lights are used, for the heat generated by gas causes the foul air to rise, and an escape for it must be found in gallery windows or the roof.

THE ORIENTAL GAS ENGINE

IS THE BEST, because it combines simplicity of construction with power and economy in space. It can be run with natural or manufactured gas or gasoline at a cost of 20 to 25 cents per horse power per day. It can be used for pumping purposes, as well as for all purposes where a perfect engine is required, with the advantage of lessening the risk of explosions. No licensed engineer at a high salary needed to operate it. Send for circulars and prices if a good safe engine is what you need.

BOOKS ON ASSAYING.

By C. H. AARON.

Part I.—Gold and Silver Ores.

SECOND EDITION—PRICE \$1.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning. The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:

Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assay; Examples of Dressing; The Melting in Crucibles; Scorching; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore; Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 130 12mo. pages, with illustrations, well bound in cloth; 1889. Price, \$1, postpaid. Sold by DEWEY PUBLISHING CO., Publishers, No. 220 Market Street, San Francisco.

Parts II and III.

Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Etc.

SECOND EDITION—JUST OUT.
Price \$1.75.

This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Osmium, etc.

Table of Contents:

Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Humid Assay of Silver; Gay Lussac's Method; Volhart's Method; Manipulation; Lead Ores; Copper Ores; Tin Ores; Mercury Ores; Zinc Ores; Nickel and Cobalt; Chromium; Bismuth; Arsenic; Antimony; Sulphur; Salt; Note.

One of the methods given for the Assay of Copper is new original and exact, as is also one of the processes for Zinc. The book contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter.

Price, postpaid, \$1.75. Sold by DEWEY PUBLISHING CO., Publishers No. 220 Market St., San Francisco.

FRUE ORE CONCENTRATOR

OVER 8200 IN ACTUAL USE.

Manufactured under Patents of April 27, 1880; September 18, 1883; July 24, 1888; and March 31, 1891.

GLADSTONE MINING COMPANY, C. J. Clark, M. E. Gen'l Supt. FRENCH GULCH, Calaveras Co., Cal., Dec 12, 1891.
MESSRS. ADAMS & CARTER, San Francisco, Cal.—DEAR SIR: During my experience in mining and milling, I have used twenty-four of your four-foot Frue Vanners on different kinds of ore, both gold and silver. I have made competitive tests against them with other widely puffed-up concentrators and have always found the Frue in first place. When I built this mill (20 stamps), I determined to put in six-foot Frues in order to save space and machinery. I am now running four of your six-foot machines and they have been going for Twelve Months. They are taking the pulp from 20 stamps, crushing a minimum of fifty tons per day, and do better work than the four-foot tables. They require no more attention than a four-foot table and handle at least twice the quantity of ore. I have run them up to 80 tons per day and could not see that they were crowded. They stop and start as easily as the smaller tables and have the advantage of double capacity with the same bearings and wearing parts, requiring no more oil, and no more wear and tear than the smaller tables. My repair account for the past six months has been too small to mention. In order to give an idea of the work they are doing here I will state that the ore has varied monthly from \$5 to \$20 per ton and the tailings from nothing to 60 cts. per ton. I will conclude by saying that I cannot endorse the six foot Frue Vanner too highly, and it is the only table that I would have in my mill.
C. J. CLARK, Gen'l Supt.

THE BLASDEL CONCENTRATING BELT COMPANY.

We are now having our new Improved Concentrating Belt manufactured in San Francisco. We keep always on hand Belts suitable for the Triumph and Frue machines, but can make any length or width desired. The advantages of these belts over any others will be readily seen by practical millmen.

First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight rifled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. These slight rifles also save very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth. We can safely say that it is a better concentrator belt than has ever been manufactured. It will last much longer and will handle more pulp. We also manufacture smooth belts with same flanges when desired.

Mining Summary.

The following is mostly condensed from journals published in the Interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

NOTES.—*Ledger*, April 28: Jas Dooley, who secured the contract for the Farrell and Albany mine road, has several men at work and will complete the 2200 feet of road in a few days. At the Hardy mine, on the Baretna property, they are now excavating and sinking the mortar blocks for a five-stamp mill. This property joins the Astoria and the Farrell property on the Calaveras side. The Bright mine, the property of Bright and Schober, has been bonded to San Francisco parties for a year. They expect to do some work upon the property as soon as the necessary arrangements can be made. In the Wildman, at Sutter Creek, the face of the 1000-foot drift is now cutting stringers of quartz of a favorable nature which is now being run in the mill. We hope that the permanent ore-body will soon be found and the pay-roll increased. The Pioneer people are perfecting plans toward the opening up of that valuable property this fall. They have had several offers for the property, but none of them have come up to the ideas of the owners, Messrs. Detert, Taylor, Eudey and Frances, so they intend to conduct it themselves. At the Albany manager, J. H. Tibbitts, reports that the face of the Littlefield tunnel is now looking very encouraging. Stringers of quartz are now being encountered giving low assays, and seepages of water denoting the fact that they are near the main ledge which crops out so prominently upon the surface. At the Farrell the work was suspended for a few days because the contractors could not make wages at the price they took the work for. Their price was raised \$2 per foot and they resumed work Saturday night and are progressing rapidly, running two shifts. Mr. Seligman is more than enthusiastic over the developments. He has several tons of ore upon the dump which he will send to Selby's as soon as the road is in condition for hauling. The latest rumor in mining circles is that the Kennedy people are arranging to purchase the Bell Weather of Sam Bright, the owner. The people of Jackson would not only like to see Mr. Bright make a good sale of the property, but would also like to see it pass into the possession of some one who is able to thoroughly equip and develop the property. The Kennedy people could do so with the greatest facility possible.

THE BRIGHT MINE.—*Amador Dispatch*, April 28: The Bright mine, located on Schober's hill near the Zeile mine reservoir, has been bonded for one year, for the sum of \$30,000, by Mr. N. A. Brady, for a company of capitalists in San Francisco, who will commence the work of developing it in a thorough manner, without unnecessary delay. It is understood that the work will be done under supervision of Mr. A. B. Oliver, an experienced mining man. Mr. Oliver was up here last week and made an investigation of the ledge and expressed himself as being very confident that it could soon be made a valuable property. The company that has taken the matter in hand is abundantly able to make a thorough development, and we have no doubt that it will soon place it among the list of dividend-paying mines, as all the indications, as far as it has been prospected, are of the most favorable character. We shall await further developments with much anxiety, as the establishment of another good mine here will add very materially to the prosperity of our town.

Inyo.

FISH SPRINGS MINES.—*Cor. Inyo Register*, April 29: The Fish Springs mines are looking well. Upton Tracy was in yesterday and reports a fine strike of gold ore made by Cnnha and Tracy. Mr. Tracy says that the ore-body is getting stronger as depth is attained, and that in sinking a vertical shaft on the vein they get a thousand pounds of good working ore per diem. Their rock yields about \$40 per ton. John Commetti is taking out a quantity of good working rock. Gilliam and Broder are pleased with the appearance of their prospect and will soon make a run at their "water-mill." John Escallon reports his claim, the Gold Bug, in fine shape, and says he will commence crushing ore some time during the present week.

Mono.

A GENERAL SHUT DOWN.—*Bodie Miner*, April 26: The Standard mine and mill will shut down temporarily the latter part of next week, and the Bodie will follow suit shortly thereafter. It is not known at this time how long operations will remain suspended, but it can be safely said it will be at least a month. This undesirable state of affairs is brought about by a scarcity of wood. When the Standard Co. last year began work on its electric plant it was calculated to complete it and have it in running order by 1st of last January, but owing to the early and severe winter and unavoidable delays, it has not yet been finished. The annual supply of wood was not laid in, the railroad bringing in altogether last summer only 5000 cords, and so now there is a general shortage. It is now said that if everything progresses favorably, electricity will be brought in by the 1st of July. Work on this end of the line is practically at a standstill on account of the non-arrival of certain blocks for the foundation of the machinery, but these are expected to come with the next team. A team left Bridgeport this week for machinery for the Green Creek end. In the meantime the Standard has purchased all the wood to be had in town, and it will probably be a month before any can be brought in from other places.

HAULING ORE.—S. B. Burkham has been

hauling ore this week from the Syndicate mine to the mill. Owing to the softness of the snow during the day he has been compelled to do the work in the night. Messrs. Parr and Tyack have quite a large quantity of ore on hand, but the trouble is to get it to the mill. They have not run the mill on their own ore since last November, and when they start up they expect to continue for some time.

Nevada.

THE IDAHO SOLD.—*Grass Valley Union*, April 29: Negotiations have been going on for some time between the Idaho and Maryland mining companies relative to the sale of the Idaho to the owners of the Maryland. It is known that arrangements have at last been completed which are satisfactory to all parties, and that the Idaho is now to become the property of the owners of the Maryland mine. A joint meeting was held to-day for the purpose of settling the matter, and the street talk has centered on that subject since the *Union*, announcing the meeting to be held to-day, was circulated this morning. Groups of men could be seen on the street corners discussing the probable arrangements to be made and stating the benefits to be derived from the different results. The meeting was held this morning and conclusions were reached regarding the affair. The stipulations of the agreement are as follows: The Idaho has agreed to sell and the Maryland to buy everything connected with the property known as the Idaho mine, which consists of the mill, water rights, ditches, pipe lines, reservoirs and all the lands of the Idaho company. All the supplies that are now on hand are also included in the contract. The two mines are to be worked as one, and will be under the efficient superintendency of Mr. Eugene C. Creller, who will represent the interest of the Idaho company. The interest of the Maryland company will be represented by Victor I. Dorsey, youngest son of Mr. S. P. Dorsey, the chief owner of the Maryland mining property. In regard to the payment, the price paid for the property is not known, but the Idaho company will receive nine-tenths of the net proceeds of the mine until the whole amount is fully paid. The mill will be started again and run to its fullest capacity. The mine will also employ a number of men other than those now employed, which will greatly add to the life of the city. This settles and sets at rest the agitation that has been ferment in the minds of most of the people of the city and county for the past year. The Idaho is the deepest gold mine in the world, and has turned out many millions of dollars to the stockholders and community. Mr. Edward Coleman was elected superintendent of the Idaho mine when it was in its infancy, and continued to superintend until about a month ago, when he resigned the office and Mr. Eugene C. Creller was elected to fill the vacancy. Mr. Creller is at present the superintendent, and will continue to be for some time. He has been connected with the mine for a score of years, and is fully competent to take the management in his hands and assume control of the property. The mine will be started on Monday, May 1st, under the new management, when the work will be commenced in dead earnest. The articles of agreement have been signed, and everything is now ready to begin operations in full blast.

A REVIVAL AROUND NEVADA CITY.—*Transcript*, April 29: "About a year or a year and a half ago it was almost a daily occurrence that we took down to Colfax large quantities of household furniture, which was being shipped to various parts of the State by parties who had left Nevada City and located elsewhere," said a railroad man to the *Transcript* reporter yesterday. "But now the reverse is the case. During the past five or six months more people have brought their furniture here than would offset all that was shipped away." At the time referred to by the railroad man, mine after mine had been closed down and there were but three or four in operation—that is, that gave employment to any great number of men. Then there were 40 or 50 vacant houses, and it looked as if 40 or 50 more would be added to the number. Since then about a dozen mines have been started up and now there is not a vacant house within a radius of a mile or so of town. Parties are talking of building new houses, and before the summer is over the number of dwellings will be increased materially. Since the time referred to a number of quartz mines have been started up and rich gravel mines have been opened, thus giving employment to four or five hundred more men than have been employed in the district for many years previous. Negotiations are going on as fast as possible to open many more new mines, and the indications are very strong that several hundred more men will be able to get employment within a very few months. The outlook for the opening of new mines in this section was never better than at the present time. The old quartz mines that are being operated in this immediate vicinity are employing a larger number of men than for many years before, and these mines, or most of them are looking better than for a long time. The gravel mines, which are now rapidly coming to the front, will astonish not only our own people but mining men abroad as to their richness. The business men now know that they are in the rich gravel channels, and it is predicted that before another year not far from a thousand men will be employed on the ridge from this city to Washington. The recent rich strike in the Harmony mine gives the strongest encouragement to all the companies on the ridge, and to this may be added the further fact that rich gravel has been found in the Utah drift mine, about a mile and a half from the Central House, towards the Yuba. The Italians who own the mine are said to be making big money, much of the gold found being coarse and nuggety. Near the Utah are situated the Filibuster and the Lupene, the latter claim being owned by Nevada City and Grass Valley parties. Enough

is now known of the quartz and gravel mines to show that they will be lasting for years and years to come. In a very short time there will be a genuine boom in the Willow Valley district, two miles from town, as more development work has been done in that district than most people hereabouts are aware of. Since the grand development in the Federal Loan, parties have been at work quietly and it is said on good authority that three good mines can now be shown which bid fair to equal the above-named mine. At Canada Hill, the Mayflower mine, the Sharpe & Nivene and others are looking well, and prospecting in that district is quite lively. The dark days of Nevada City have passed and bright ones will be its lot now for the next decade.

OLD ORLEANS MINE.—*Grass Valley Union*, April 26: This mine, which has lain idle for many years, has lately been worked by Abe Powning and several others, and they are taking out some fair looking ore. The old Orleans mine, which is a continuation of the Empire, is down to a depth of 108 feet. From this level they have run a drift, 150 feet in length, and struck a vein of ore which, though very small, is of a good quality. The rock will pay from \$50 to \$90 a ton. Twelve men are at work and should the vein widen out they will have a good paying mine.

MILL LEASED.—*Grass Valley Telegraph*, April 26: Mr. Alf. Tregidgo has leased the Larimer mill and will begin putting it in repair immediately. The mill, and also the Rogers mill, owned by Mr. Tregidgo, will soon be running on the ore from the Massachusetts Hill dump. There is an immense amount of ore on the dump and it is thought that there is a good profit to be made in screening the rock and putting it through the mill. For years it has been the habit of specimen hunters to visit the prize pile of rock, after a rain, and look for specimens, and many very rich pieces of ore have been found on the dump. There will be much money gleaned from the crushings of the dumps on Massachusetts Hill.

San Bernardino.

THE DESERT COUNTRY.—*Needles Eye*, April 29: The desert country is at last to be the gold-producing section of the State. The mines are far richer than any of the blue gravel diggings to the north, and as soon as water can be obtained the thousands of acres of placer ground in the north end of the mountains will be worked at a great profit. The desert country is spotted over with placer ground that some day will produce immense wealth. Hon. P. F. Collins has made an important discovery of gold ore on the old Government road, eight miles west of Fort Mojave. The ledge is six feet in width, and a sample from the entire vein gave a result of \$80 per ton gold. The ore is heavily impregnated with iron and is free milling. For years the ledge has been traveled over, but no one had the faintest idea that it contained the precious metals. Should development prove the vein as rich as the surface promises, Mr. Collins will indeed have a bonanza. Reports from the new town of Vanderbilt seem to be giving the boys around town the mining fever. There are many miners and prospectors in and around Cosman Springs and many mines have been located and are being worked. It is probable that this claim will cause quite a stir in mining circles within the next few months. Easum & Longstreet have a splendid prospect at a place north of Vanderbilt known as Cosman Springs. Mr. Easum is foreman of the Gold Bronze at Vanderbilt and is a first-class miner. Longstreet is an old-time prospector. Considerable work will be done on the property this summer and fall.

Shasta.

LOWER SPRINGS.—*Cor. Shasta Courier*, April 29: Times are lively up here. The quartz miner and pocket hunter are busy nowadays. Placer mining is nearly ended for this season and must soon give way to its stronger brother. We miners feel confident that we will open up some good-paying mines this coming summer. Several good prospects are lying idle at the present time on account of too much water. As soon as the ground dries out work will be resumed upon them. Men whose ledges are so situated as to be worked by tunnels are to be congratulated. T. Spragins has his tunnel on the Sally Ann mine in some 17 feet. The ledge is 15 inches wide, in decomposed quartz. Mr. Spragins has made as high as \$5 a day rocking the ore as it came from the tunnel, and would be working it at the present time only he stopped to enlarge his dwelling, which is situated where old Virginia town used to stand. A. J. Tilton panned out a nugget weighing \$14 last week. B. Peterson is working below Miller's ranch and is getting some good prospects. J. H. Wiser has located the old Mascot claim. He has found large quantities of rich float below the ledge on a flat that was immensely rich in early days. He intends to develop the claim and thinks it will prove a bonanza. He also owns, in company with Sheriff Ross, a valuable mine near Deakin & Taylor's ranch. The ledge is eight feet wide and milled \$16 a ton from wall to wall. They have a tunnel started that will tap the ledge 90 feet deep. In driving the tunnel ahead they have encountered seams that give astonishing prospects when sampled with a pan. Joseph Penrose was working on his tunnel last week. He drove ahead ten feet. The ledge is getting larger and gives a fair prospect with a pan. The owners of the Bull's Gulch mine will resume operations as soon as the water drains away. Five tons of ore taken out of a 15-inch vein in bottom of shaft milled \$20 a ton in free gold at Sonoma's. Some flattering prospects were discovered on the old Hargrave mine a few days ago. Sonoma is driving his tunnel ahead. The rock is getting softer and works far better than it did at the start. The tunnel is in over 300 feet. I am informed that Mr.

Somonia intends to erect a hydraulic on the mine to strip the ledge—a good scheme, as water can be obtained from the Gold Hill ditch, which runs high above the claim. Should he carry his plan into effect, it will live times up considerable. The Don't Bother Me claim is the best in the camp. The writer, in company with the owner, Mr. J. C. Frick, went to see the claim some time ago. The ledge runs east and west. A tunnel has been run in on the ledge for nearly 200 feet, showing a well-defined ledge of rich ore, two feet wide, that averages one ounce to the ton in free gold. Many years ago Spaniards worked the mine with a Mexican arrastre, which still stands on the claim. Trees that measure eight inches in diameter have grown up in its bed, which goes to prove it was worked quite a long time ago. Mr. Frick has panned out as high as \$2 to a pan where they dumped the ore before charging the arrastre, and has frequently found lovely specimens in their old workings. The Deakin & Taylor mines are still under Mr. Frick's management. It is reported that they are going to erect a mill. Mr. Frick has sufficient ore in sight to justify such an enterprise.

Trinity.

NEW RIVER.—*Trinity Journal*, April 29: Everybody is at work, and prospects look good for the summer. There is a new sort of mining started up in the way of slicing the dumps from some of the rich mines here wherever water can be got on to them. Ladd & Clements last season, in about two months' run, cleaned up over \$2000. Miller & Sone have put water on the Sherwood mine, and the other day made a clean-up, after ten days' run with two men, of \$200. Yocom & Son have about completed a ditch for the purpose of bringing water on to the Hard Tack dump. Ladd & Clements will start up the Hard Tack mine soon with a good force of men, and will no doubt do well, as that mine has produced some of the highest-grade ore in camp.

BRO BAR.—Everything down this way is looking favorable again. The mines are running at full blast, and are prospecting quite well. Harrington & Gore are cutting a bedrock ditch through which they are going to tap the bar. The Chinese at Price's claim are supposed to be doing well.

NEVADA.

Washoe District.

CON. CAL. & VA. MINE.—*Virginia Chronicle*, Apr. 29: 1500 level—Have continued to extract ore and old fillings in working upward in the old south stope, from the 10th to the 16th floors, above the sill floor of this level. 1650 level—Have continued making necessary repairs to the drifts on the sill floor of this level. We continue to extract some ore from the old stopes, eight floors up in the npraise, No. 6 carried up from the main northwest drift; also from the old stopes in working north from the crosscut run west from the north-west drift. From the drift run west from these north workings, 27 feet up, the npraise, started 50 feet in from the mouth of the drift, has been carried up 13 feet; total height, 60 feet; the top being in a quartz formation carrying a low assay value. Have continued to stope out ore of fair quality in working on the north and south sides of the drift run east (at a point 20 feet down) from the winze which was sunk from the crosscut run west from the main northwest drift. From the end of the drift run south from near the bottom of that winze (52 feet down) an east crosscut has been advanced 37 feet in porphyry and quartz of low assay value. Have extracted during the week from all parts of the mine 605 cars of ore, about 640 tons. Shipped to Morgan mill 671 100-2000 tons of ore. Average assay value, per railroad car samples, \$31.34. The assay value per battery sample of all the ore worked at that mill during the week (655 tons), was \$27.03 per ton. Shipped bullion to Carson Mint, assay value, \$12,309.06.

OPRER.—500 level—Jointly with Mexican Co. continue doing necessary repair work in the west drift from the main shaft. 1565 level—The west crosscut started from the bottom of the winze, sunk 52 feet below the sill floor of this level, has been advanced 15 feet in a porphyry, clay and quartz formation which carries a low assay value.

MEXICAN.—On the 1565 level—West crosscut No. 2 from the north drift from the east crosscut from the bottom of the winze, sunk from the 1465 level down to this level near the south boundary, has been extended 21 feet; total length, 173 feet, continuing in porphyry formation carrying clay separations.

UTAH.—340 level—West crosscut No. 3 from the north drift, from west crosscut No. 2, at a point 195 feet in from its mouth, has been extended 15 feet; total length, 122 feet; in quartzite and clay formation of very low assay value.

SIEBNA NEVADA.—The intermediate tunnel on Cedar Hill has been advanced during the week 15 feet, making the total length 312 feet; the face is in hard porphyry. The joint Sierra Nevada and Union west drift, 900 level, has been advanced 21 feet, making the total distance west of the joint shaft 3143 feet; the face is in porphyry and streaks of clay.

UNION SHAFT.—The joint Sierra Nevada and Union west drift, 900 level, has been advanced the past week 21 feet, making the total distance west of the shaft 3143 feet; the face is in porphyry and streaks of clay.

ANDES.—On 420 level from north drift from east crosscut No. 1 north, a west crosscut has been advanced 14 feet. This crosscut is all in quartz of very low assay value.

BEST & BLOCHER.—200 level—At a point in northwest drift, 230 feet from our south line, started west crosscut No. 2 and advanced same 22 feet, passing through porphyry and quartz; total length, 42 feet. 900 level—At a point southwest drift 112 feet from west crosscut

No. 3, started west crosscut No. 4, and extended same a distance of 12 feet; face in hard porphyry. Sinto tunnel level—We are now running an east crosscut to make connection between the Gould & Curry winze, which was carried down by them from the 1600 level, and the joint north drift.

GOULD & CURRY.—200 level—During the past week west crosscut No. 5, started in north-west drift, 432 feet from main west drift, has been advanced 11 feet; total length, 446 feet; face in hard porphyry. Sinto tunnel level—On level we are now running an east crosscut to make connection between our winze from the 1600 level and the joint north drift.

HALE & NORCROSS.—1800 level—Advanced west crosscut on our south boundary 15 feet; total length, 125 feet; face of this crosscut has reached the west wall of this ledge. Have discontinued work in the face and are now cutting out a place in this crosscut at a point 60 feet back from the face, for an nraise in some favorable-looking quartz. Main shaft—At 1300 level we have been doing necessary work preparatory to retimbering between the 1300 and 1100 levels, and are repairing main incline between the 1300 and 1400 levels.

CHOLLAR.—The east crosscut near the south line, 930 level, is out 146 feet; face is in porphyry and seams of quartz.

POTOSI.—The east crosscut No. 3, 850 level, is out 375 feet; face is in porphyry and seams of quartz. Have started a drift north from the last-named crosscut, at a point 204 feet east of the footwall, following a clay wall and streak of quartz giving low assays; drift is out 10 feet. The nraise 75 feet south of Potosi winze, 930 level, is up 35 feet; formation in the top is porphyry and streaks of quartz. North drift 200 feet east of Potosi winze, 930 level, is out 16 feet; face shows 15 inches of quartz of low grade. The west crosscut from north drift, 930 level, is out 80 feet; face is in hard porphyry. Have started an nraise 80 feet north of top of raise, 1000 level, which is up 25 feet; top is in porphyry and quartz. On the same level, 20 feet south of top of raise, from 1100 level, have started an nraise which is up 12 feet; top shows five feet of quartz that gives fair assays. Extracted and sent to mill the past week 4983 tons from the 550, 930, 1000 and 1150 levels. Milled during the week 525 tons. On hand at mill, 101 tons and 250 pounds. Average battery assays, \$25.12; average car sample assays, \$29.32. Shipped to the U. S. Mint, Carson, 390 pounds of crude bullion.

BULLION.—Are yet engaged in retimbering and repairing the Ward shaft, which is not yet completed.

APEX.—Have finished timbering and begun to sink the winze, making total depth 55 feet; the ledge is promising.

EXCHERQUE.—Have not yet completed retimbering and repairing the Ward shaft.

KENTUCK.—We continue to extract from two

to three tons of ore per day from the 160 level of the average value of \$34 per ton. On the 1100 level we have been timbering and preparing for regular extraction of ore for the mill.

ALPHA.—Are yet engaged retimbering the Ward shaft.

WARD SHAFT.—Are retimbering the shaft 20 feet from the surface.

OCCIDENTAL.—The main north drift on the 750 level has been extended 12 feet; total length, 743 feet; face is in hard porphyry. The nraise above No. 2 winze in south drift, 750 level, is up 136 feet, and continues in ore of fair grade. The Zedig drift has been advanced 10 feet in hard porphyry; total length, 941 feet.

CON. NEW YORK.—The south drift from the bottom of the winze below the 650 level is in a distance of 30 feet; the face is in quartz, some of which gives fair assays. The south drift from No. 4 west crosscut, 800 level, is in a distance of 48 feet; formation, soft porphyry.

SILVER HILL.—The southeast drift on the 450 level has been advanced 7 feet during the past week, making the total distance from north line, 103 feet, the face is in hard porphyry.

BRITISH COLUMBIA.

ANOTHER PROMISING PLACER.—Nelson Miner, April 22: The Rip Van Winkle placer mine near Lytton, will probably be one of the next great mining excitements in this country. The mine is equipped and in working order. Mr. J. B. Hobson, a placer miner of nearly thirty years' experience in California, is in charge, and those who should know challenge you to find a better man for his work in the province. All that the company is waiting for now is for the break up of winter, and already warm winds are blowing and soft rains falling. At the end of this month there will be a great camp of interested ones in this placer watching the first fortnight's work, and waiting for the first wash-up. Public opinion says that the mine is a sure thing already, and shares that were bought last summer at \$1000 are sought eagerly but vainly at \$4500 to-day. The men who are waiting for that first wash-up don't care to "stand on velvet." When those boxes are opened up they expect to see something which will practically guarantee them several hundred per cent per annum on their investment. "Whole hog or non" is their motto, and they, together with "the good old Jim," who led most of them into this good thing, deserve all the luck in the world.

Complimentary Samples.

Persons receiving this paper marked, are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber please show the paper to others.

The most successful Machine made for
Pulverizing Quartz,
Ores of all kinds,
Phosphate Rock,
Carbon Foundry Facings,
Plumbago, Portland Rock,
and Cements, etc.

A PERFECT PULVERIZER, THE NEW GRIFFIN MILL, OF ALL REFRACTORY SUBSTANCES.

Will work either wet or dry.
Capacity from two to four tons
per hour, to sixty mesh or finer.

Scientific Press

Patent Agency.

ESTABLISHED 1863.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 220 Market St. S. F.
